

■ AXLE

1. Front Axle

- Compact and highly rigid double-row angular ball bearings are used on the front axle. The double-row angular ball bearings and the axle hub have been integrated to ensure high rigidity, thus realizing excellent driving stability and braking stability.
- An active speed sensor, which is capable of detecting extremely low speeds, is used. The active speed sensor and the magnet type rotor are a built-in type.
- A 12-point lock nut is used and staked in order to ensure that the axle hub is properly tightened. Once removed, this nut cannot be reused.

2. Rear Axle

- Compact and highly rigid double-row angular ball bearings are used on the rear axle. The bearings and the axle hub have been integrated to ensure high rigidity, thus realizing excellent driving and braking stability.
- An active speed sensor, which is capable of detecting extremely low speeds, is used. The active speed sensor and the magnet type rotor are a built-in type.
- A 12-point lock nut is used and staked in order to ensure that the axle hub is properly tightened. Once removed, this nut cannot be reused. (Only for 4WD models)
