<sup>1</sup>The ampacities under subheading D shall be permitted for single-conductor Types SC, SCE, SCT, PPE, and W cable only where the individual conductors are not installed in raceways and are not in physical contact with each other except in lengths not to exceed 600 mm (24 in.) where passing through the wall of an enclosure.

<sup>2</sup>The ampacities under subheading E apply to two-conductor cables and other multiconductor cables connected to utilization equipment so that only two conductors are current-carrying.

<sup>3</sup>The ampacities under subheading F apply to three-conductor cables and other multiconductor cables connected to utilization equipment so that only three conductors are current-carrying.

**TABLE 400.5(A)(3) Adjustment Factors for More Than Three Current-Carrying Conductors in a Flexible Cord or Cable**

Number of Conductors	Percent of Value in Tables 400.5(A) and 400.5(B)
4–6	80
7–9	70
10–20	50
21–30	45
31–40	40
41 and above	35

Temperature correction factor for 95°F ambient = 0.96 from Table 310.15(B)(16), 90°C column for copper conductors:

$$200 / (0.8 \times 0.96) = 260.4 \text{ amperes or } 260 \text{ amperes}$$

STEP 2. Select the cable. From Table 400.5(A)(2), a 3/0 AWG copper Type W portable power cable has an ampacity of 274 amperes from the 90°C, F column. In accordance with 110.14, the 90°C cable ampacity can be used where it is required to “derate” the cable ampacity. For this particular installation, both an ambient temperature correction factor and an ampacity adjustment factor for more than

three current-carrying conductors in the cable have to be applied.

**STEP 3.** Evaluate the termination rating. Compliance with the termination temperature requirement of 110.14(C)(1)(b) is met with this 3/0 AWG cable, since its 75°C ampacity is 241 amperes. Compliance with 110.14(C) is based on Table 310.15(B)(16) conductor ampacities, and the ampacity from that table for a 75°C, 3/0 AWG copper conductor is 200 amperes. Therefore, this cable with 3/0 conductors operating at 200 amperes (noncontinuous plus continuous loads) is of sufficient physical size to dissipate the heat occurring at equipment terminations.

The important factor is that the load (200 amperes minus the 25 percent increase for those loads considered to be continuous) supplied by this cable does not cause the cable to operate at an ampacity greater than that specified in Table 310.15(B)(16) for a 75°C, 3/0 AWG copper conductor.

**Informational Note:** See Informative Annex B, Table B.310.15(B)(2)(11), for adjustment factors for more than three current-carrying conductors in a raceway or cable with load diversity.

A neutral conductor that carries only the unbalanced current from other conductors of the same circuit shall not be required to meet the requirements of a current-carrying conductor.

In a 3-wire circuit consisting of two phase conductors and the neutral conductor of a 4-wire, 3-phase, wye-connected system, a common conductor carries approximately the same current as the line-to-neutral currents of the other conductors and shall be considered to be a current-carrying conductor.

On a 4-wire, 3-phase, wye circuit where more than 50 percent of the load consists of nonlinear loads, there are harmonic currents present in the neutral conductor and the neutral conductor shall be considered to be a current-carrying conductor.

An equipment grounding conductor shall not be considered a current-carrying conductor.

Where a single conductor is used for both equipment grounding and to carry unbalanced current from other conductors, as provided for in 250.140 for electric ranges and electric clothes dryers, it shall not be considered as a current-carrying conductor.

**(B) Ultimate Insulation Temperature.** In no case shall conductors be associated together in such a way with respect to the kind of circuit, the wiring method used, or the number of conductors such that the limiting temperature of the conductors is exceeded.

**(C) Engineering Supervision.** Under engineering supervision, conductor ampacities shall be permitted to be calculated in accordance with 310.15(C).

This section allows the conductor ampacity of flexible cords and cables to be determined in accordance with the Neher-McGrath formula found in 310.15(C). See the commentary following 310.15(C).

## 400.6 Markings

**(A) Standard Markings.** Flexible cords and cables shall be marked by means of a printed tag attached to the coil reel or carton. The tag shall contain the information required in 310.120(A). Types S, SC, SCE, SCT, SE, SEO, SEOO, SJ, SJE, SJEO, SJEOO, SJO, SJT, SJTO, SJTOO, SO, SOO, ST, STO, STOO, SEW, SEOW, SEOOW, SJEW, SJEOW, SJEOOW, SJOW, SJTW, SJTOW, SJTOOW, SOW, SOOW, STW, STOW, and STOOOW flexible cords and G, G-GC, PPE, and W flexible cables shall be durably marked on the surface at intervals not exceeding 610 mm (24 in.) with the type designation, size, and number of conductors.

**(B) Optional Markings.** Flexible cords and cable types listed in Table 400.4 shall be permitted to be surface marked to indicate special characteristics of the cable materials. These markings include, but are not limited to, markings for limited smoke, sunlight resistance, and so forth.

In addition to the markings identified in 400.6(A) and (B), the *UL Guide Information for Electrical Equipment — The White Book-2010*, under the category Flexible Cord (ZJCZ), lists the following markings:

“For Mobile Home Use,” “For Recreational Vehicle Use,” or “For Mobile Home and Recreational Vehicle Use” followed by the current rating in amperes indicates suitability for use in mobile homes or recreational vehicles.

“W” indicates suitability for use outdoors and for immersion in water. The low temperature rating for these cords is –40°C, unless otherwise marked on the cord with optional ratings of –50°C, –60°C, or –70°C. The low temperature ratings are determined by means of a bend test (not a suppleness test) at the given temperature.

“VW-1” indicates that the cord complies with a vertical flame test. Cord that has been evaluated for leakage currents between the circuit conductor and the grounding conductor and between the circuit conductor and the outer surface of the jacket may have the leakage current values marked on the cable jacket.

### 400.7 Uses Permitted

(A) **Uses.** Flexible cords and cables shall be used only for the following:

- (1) Pendants
- (2) Wiring of luminaires
- (3) Connection of portable luminaires, portable and mobile signs, or appliances
- (4) Elevator cables
- (5) Wiring of cranes and hoists
- (6) Connection of utilization equipment to facilitate frequent interchange
- (7) Prevention of the transmission of noise or vibration
- (8) Appliances where the fastening means and mechanical connections are specifically designed to permit ready removal for maintenance and repair, and the appliance is intended or identified for flexible cord connection
- (9) Connection of moving parts
- (10) Where specifically permitted elsewhere in this *Code*

(B) **Attachment Plugs.** Where used as permitted in 400.7(A)(3), (A)(6), and (A)(8), each flexible cord shall be equipped with an attachment plug and shall be energized from a receptacle outlet or cord connector body.

*Exception:* As permitted in 368.56.

### 400.8 Uses Not Permitted

Unless specifically permitted in 400.7, flexible cords and cables shall not be used for the following:

- (1) As a substitute for the fixed wiring of a structure
- (2) Where run through holes in walls, structural ceilings, suspended ceilings, dropped ceilings, or floors
- (3) Where run through doorways, windows, or similar openings
- (4) Where attached to building surfaces

*Exception to (4): Flexible cord and cable shall be permitted to be attached to building surfaces in accordance with the provisions of 368.56(B)*

Section 368.56(B) provides the requirements for the installation of flexible cords installed as branches from busways.

- (5) Where concealed by walls, floors, or ceilings or located above suspended or dropped ceilings
- (6) Where installed in raceways, except as otherwise permitted in this *Code*

The flexible cords and cables referred to in Article 400 are not limited to use with portable equipment. However, 400.8

prohibits the use of flexible cords and cables as a substitute for the fixed wiring of a structure or where concealed behind building walls, floors, or ceilings (including structural, suspended, or dropped-type ceilings). See 240.5, 590.4(B), and 590.4(C) for the uses of multiconductor flexible cords for feeder and branch-circuit installations and for overcurrent protection requirements for flexible cord. See 410.62 for cord-connected luminaires.

- (7) Where subject to physical damage

### 400.9 Splices

Flexible cord shall be used only in continuous lengths without splice or tap where initially installed in applications permitted by 400.7(A). The repair of hard-service cord and junior hard-service cord (see Trade Name column in Table 400.4) 14 AWG and larger shall be permitted if conductors are spliced in accordance with 110.14(B) and the completed splice retains the insulation, outer sheath properties, and usage characteristics of the cord being spliced.

The requirements of 400.9 are intended to ensure that flexible cords and cables first installed under any of the uses permitted in 400.7(A)(1) through 400.7(A)(10) are in their original or near-original condition. The provisions of this section permit repair of a damaged cord in such a manner that the cord will retain its original operating and use integrity. However, if the repaired cord is reused or reinstalled at a new location, the in-line repair is no longer permitted, and the cord can be used only in lengths that do not contain a splice.

### 400.10 Pull at Joints and Terminals

Flexible cords and cables shall be connected to devices and to fittings so that tension is not transmitted to joints or terminals.

*Exception:* Listed portable single-pole devices that are intended to accommodate such tension at their terminals shall be permitted to be used with single-conductor flexible cable.

**Informational Note:** Some methods of preventing pull on a cord from being transmitted to joints or terminals are knotting the cord, winding with tape, and fittings designed for the purpose.

### 400.11 In Show Windows and Showcases

Flexible cords used in show windows and showcases shall be Types S, SE, SEO, SEOO, SJ, SJE, SJEO, SJEOO, SJO, SJOO, SJT, SJTO, SJTOO, SO, SOO, ST, STO, STOO, SEW, SEOW, SEOOW, SJEW, SJEOW, SJEOOW, SJOW, SJOOW, SJTW, SJTOW, SJTOOW, SOW, SOOW, STW, STOW, or STOOOW.

*Exception No. 1: For the wiring of chain-supported luminaires.*

*Exception No. 2: As supply cords for portable luminaires and other merchandise being displayed or exhibited.*

Flexible cords identified for hard usage or extra-hard usage should be used in show windows and showcases because cords in these locations can come in contact with combustible materials, such as fabrics or paper products, and they are exposed to wear and tear from continual house-keeping and display changes. Flexible cords used in show windows and showcases should be maintained in good condition.

### 400.13 Overcurrent Protection

Flexible cords not smaller than 18 AWG, and tinsel cords or cords having equivalent characteristics of smaller size approved for use with specific appliances, shall be considered as protected against overcurrent in accordance with 240.5.

### 400.14 Protection from Damage

Flexible cords and cables shall be protected by bushings or fittings where passing through holes in covers, outlet boxes, or similar enclosures.

A variety of bushings and fittings, both insulated and noninsulated, are available for protecting flexible cords and cables, as required by 400.14. Some bushings or fittings include pull-relief means, as required in 400.10. Many insulating bushings are listed by Underwriters Laboratories Inc. in the following product categories:

1. Conduit fittings (bushings and fittings for use on the ends of conduit in boxes and gutters)
2. Insulating devices and materials
3. Outlet bushings and fittings (for use on the ends of conduit, electrical metallic tubing, or armored cable where a change to open wiring is made)

In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, flexible cords and cables shall be permitted to be installed in aboveground raceways that are no longer than 15 m (50 ft) to protect the flexible cord or cable from physical damage. Where more than three current-carrying conductors are installed within the raceway, the allowable ampacity shall be reduced in accordance with Table 400.5(A)(3).

Section 400.14 allows flexible cords and cables installed in an industrial facility to be installed in aboveground raceways where the length of the raceway does not exceed 50 ft and the conductors are protected at their ampacity after application of the adjustment factors for more than three current-carrying conductors as specified in Table 400.5(A)(3).

## II. Construction Specifications

### 400.20 Labels

Flexible cords shall be examined and tested at the factory and labeled before shipment.

See the definition of *labeled* in Article 100.

### 400.21 Construction

**(A) Conductors.** The individual conductors of a flexible cord or cable shall have flexible stranding and shall not be smaller than the sizes specified in Table 400.4.

Section 400.21(A) is new in the 2011 *Code*. It consolidates construction requirements in Part II by relocating and modifying a requirement that was formerly found in 400.12. The requirement now clearly calls for conductors to be stranded. Stranding is essential to ensure that the conductors are flexible. See the requirements in 110.14 regarding connectors and terminals used with stranded conductors having other than Class B and Class C stranding.

**(B) Nominal Insulation Thickness.** The nominal thickness of insulation for conductors of flexible cords and cables shall not be less than specified in Table 400.4.

### 400.22 Grounded-Conductor Identification

One conductor of flexible cords that is intended to be used as a grounded circuit conductor shall have a continuous marker that readily distinguishes it from the other conductor or conductors. The identification shall consist of one of the methods indicated in 400.22(A) through (F).

**(A) Colored Braid.** A braid finished to show a white or gray color and the braid on the other conductor or conductors finished to show a readily distinguishable solid color or colors.

**(B) Tracer in Braid.** A tracer in a braid of any color contrasting with that of the braid and no tracer in the braid of the other conductor or conductors. No tracer shall be used in the braid of any conductor of a flexible cord that contains a conductor having a braid finished to show white or gray.

*Exception: In the case of Types C and PD and cords having the braids on the individual conductors finished to show white or gray. In such cords, the identifying marker shall be permitted to consist of the solid white or gray finish on one conductor, provided there is a colored tracer in the braid of each other conductor.*

**(C) Colored Insulation.** A white or gray insulation on one conductor and insulation of a readily distinguishable color or colors on the other conductor or conductors for cords having no braids on the individual conductors.

For jacketed cords furnished with appliances, one conductor having its insulation colored light blue, with the other conductors having their insulation of a readily distinguishable color other than white or gray.

*Exception: Cords that have insulation on the individual conductors integral with the jacket.*

The insulation shall be permitted to be covered with an outer finish to provide the desired color.

**(D) Colored Separator.** A white or gray separator on one conductor and a separator of a readily distinguishable solid color on the other conductor or conductors of cords having insulation on the individual conductors integral with the jacket.

Identification of grounded conductors in flexible cords and cables, as required by 400.22(D), can be accomplished through the use of a white- or gray-colored braid, a white- or gray-colored tracer in the braid, white- or gray-colored insulation, or a white- or gray-colored separator. In existing installations where a gray-colored braid, tracer, or conductor insulation is encountered, caution should be exercised because gray may have been used as means to identify ungrounded conductors.

**(E) Tinned Conductors.** One conductor having the individual strands tinned and the other conductor or conductors having the individual strands untinned for cords having insulation on the individual conductors integral with the jacket.

**(F) Surface Marking.** One or more ridges, grooves, or white stripes located on the exterior of the cord so as to identify one conductor for cords having insulation on the individual conductors integral with the jacket.

Section 400.22(F) requires surface marking of conductors. One method is to identify the grounded conductor in a cord where the insulation of the conductor is part of the molded

jacket and is not separable. A white stripe on the exterior of the cord serves to identify the segment of the cord that contains the grounded conductor. An example of a type of cord with these characteristics is zip cord, which is commonly used for floor lamps and table lamps. It is important that the grounded conductor be easily identified where zip cord is used for wiring lampholders, because the *Code* requires the grounded conductor to be connected to the device terminal that connects to the screw shell of the lampholder.

### 400.23 Equipment Grounding Conductor Identification

A conductor intended to be used as an equipment grounding conductor shall have a continuous identifying marker readily distinguishing it from the other conductor or conductors. Conductors having a continuous green color or a continuous green color with one or more yellow stripes shall not be used for other than equipment grounding conductors. The identifying marker shall consist of one of the methods in 400.23(A) or (B).

**(A) Colored Braid.** A braid finished to show a continuous green color or a continuous green color with one or more yellow stripes.

**(B) Colored Insulation or Covering.** For cords having no braids on the individual conductors, an insulation of a continuous green color or a continuous green color with one or more yellow stripes.

### 400.24 Attachment Plugs

Where a flexible cord is provided with an equipment grounding conductor and equipped with an attachment plug, the attachment plug shall comply with 250.138(A) and (B).

## III. Portable Cables Over 600 Volts, Nominal

### 400.30 Scope

Part III applies to multiconductor portable cables used to connect mobile equipment and machinery.

### 400.31 Construction

**(A) Conductors.** The conductors shall be 12 AWG copper or larger and shall employ flexible stranding.

•

**(B) Equipment Grounding Conductor(s).** An equipment grounding conductor(s) shall be provided. The total area

shall not be less than that of the size of the equipment grounding conductor required in 250.122.

#### 400.32 Shielding

All shields shall be connected to an equipment grounding conductor.

#### 400.33 Equipment Grounding Conductors

Equipment grounding conductors shall be connected in accordance with Parts VI and VII of Article 250.

#### 400.34 Minimum Bending Radii

The minimum bending radii for portable cables during installation and handling in service shall be adequate to prevent damage to the cable.

#### 400.35 Fittings

Connectors used to connect lengths of cable in a run shall be of a type that locks firmly together. Provisions shall be made to prevent opening or closing these connectors while energized. Suitable means shall be used to eliminate tension at connectors and terminations.

#### 400.36 Splices and Terminations

Portable cables shall not contain splices unless the splices are of the permanent molded, vulcanized types in accordance with 110.14(B). Terminations on portable cables rated over 600 volts, nominal, shall be accessible only to authorized and qualified personnel.

## ARTICLE 402 Fixture Wires

### Contents

- 402.1 Scope
- 402.2 Other Articles
- 402.3 Types
- 402.5 Allowable Ampacities for Fixture Wires
- 402.6 Minimum Size
- 402.7 Number of Conductors in Conduit or Tubing
- 402.8 Grounded Conductor Identification
- 402.9 Marking
  - (A) Method of Marking
  - (B) Optional Marking
- 402.10 Uses Permitted
- 402.11 Uses Not Permitted
- 402.12 Overcurrent Protection

#### 402.1 Scope

This article covers general requirements and construction specifications for fixture wires.

#### 402.2 Other Articles

Fixture wires shall comply with this article and also with the applicable provisions of other articles of this *Code*.

Informational Note: For application in luminaires, see Article 410.

#### 402.3 Types

Fixture wires shall be of a type listed in Table 402.3, and they shall comply with all requirements of that table. The fixture wires listed in Table 402.3 are all suitable for service at 600 volts, nominal, unless otherwise specified.

Informational Note: Thermoplastic insulation may stiffen at temperatures colder than  $-10^{\circ}\text{C}$  ( $+14^{\circ}\text{F}$ ), requiring that care be exercised during installation at such temperatures. Thermoplastic insulation may also be deformed at normal temperatures where subjected to pressure, requiring that care be exercised during installation and at points of support.

#### 402.5 Allowable Ampacities for Fixture Wires

The allowable ampacity of fixture wire shall be as specified in Table 402.5.

No conductor shall be used under such conditions that its operating temperature exceeds the temperature specified in Table 402.3 for the type of insulation involved.

Informational Note: See 310.15(A)(3) for temperature limitation of conductors.

#### 402.6 Minimum Size

Fixture wires shall not be smaller than 18 AWG.

#### 402.7 Number of Conductors in Conduit or Tubing

The number of fixture wires permitted in a single conduit or tubing shall not exceed the percentage fill specified in Table 1, Chapter 9.

The fill requirements of 402.7 are specified in Table 1 of Chapter 9, which gives the maximum percent fill of conduit or tubing. Table 4 of Chapter 9 provides the usable area within the selected conduit or tubing, and Table 5 of Chapter 9 provides the required area for each of the conductors. Examples using these tables to calculate a conduit or tubing size are provided according to Chapter 9, Table 1, Note 6.

The following examples show how to determine the minimum size conduit where the conductors are different

TABLE 402.3 Fixture Wires

Name	Type Letter	Insulation	AWG	Thickness of Insulation		Outer Covering	Maximum Operating Temperature	Application Provisions
				mm	mils			
Heat-resistant rubber-covered fixture wire — flexible stranding	FFH-2	Heat-resistant rubber	18–16	0.76	30	Nonmetallic covering	75°C 167°F	Fixture wiring

16	8
14	17
12	23
10	28

sizes and how to select the minimum size conduit directly from the tables in Informative Annex C where the conductors are all the same size.

Calculation Example 1

A remote ballast installation requires a single flexible metal conduit to contain fourteen 16 AWG TFFN fixture wires and three 12 AWG THHN conductors. What size flexible metal conduit is required?

Solution

STEP 1. Using Table 1, look up the maximum percent of cross section of conduit permitted for conductors. Table 1 sets the limit of conductor fill for over two conductors at 40 percent of the total cross-sectional area of the raceway. Note 6 to the table refers to Table 5 for dimensions of the conductors and Table 4 for the dimensions of the raceway.

STEP 2. Look up the individual conductor cross-sectional areas in Chapter 9, Table 5:

16 AWG TFFN = 0.0072 in.<sup>2</sup>

12 AWG THHN = 0.0133 in.<sup>2</sup>

STEP 3. Calculate the total area occupied by the wires as follows:

Fourteen 16 AWG TFFN × 0.0072 = 0.1008 in.<sup>2</sup>

Three 12 AWG THHN × 0.0133 = 0.0399 in.<sup>2</sup>

Total area = 0.1407 in.<sup>2</sup>

STEP 4. Using the 40 percent column of Table 4, in the section entitled “Article 348 — Flexible Metal Conduit (FMC),” look up the appropriate flexible metal conduit size based on 40 percent fill and a total conductor area fill of 0.1407 in.<sup>2</sup>. Because 0.1407 in.<sup>2</sup> is greater than 0.127 and less than 0.213, select trade size ¾ flexible metal conduit.

Calculation Example 2

If the conductors in a raceway or tubing are all of the same wire size, the Informative Annex C tables may be used instead of doing the calculations. This example uses Informative Annex C tables to determine electrical metallic tubing size.

A fire alarm system requires a riser to contain thirty-six

16 AWG TFFN conductors. What size electrical metallic tubing is required?

Solution

STEP 1. In Informative Annex C, Table C1, find TFFN insulation in the first column.

STEP 2. Find 16 AWG in the second column. Proceed across the table until the desired number of conductors is equal to or less than the number shown in the table for the respective conduit and tubing sizes.

Conclusion: Trade size 1 EMT is required.

402.8 Grounded Conductor Identification

Fixture wires that are intended to be used as grounded conductors shall be identified by one or more continuous white stripes on other than green insulation or by the means described in 400.22(A) through (E).

Section 402.8 provides a rule similar to that required for flexible cords and cable to ensure that the grounded conductor in fixture wires is easily recognized. Because it is necessary that the grounded conductor be connected to the screw shell of lampholders, it must be easily recognized.

402.9 Marking

(A) **Method of Marking.** Thermoplastic insulated fixture wire shall be durably marked on the surface at intervals not exceeding 610 mm (24 in.). All other fixture wire shall be marked by means of a printed tag attached to the coil, reel, or carton.

(B) **Optional Marking.** Fixture wire types listed in Table 402.3 shall be permitted to be surface marked to indicate special characteristics of the cable materials. These markings include, but are not limited to, markings for limited smoke, sunlight resistance, and so forth.

402.10 Uses Permitted

Fixture wires shall be permitted (1) for installation in luminaires and in similar equipment where enclosed or protected and not subject to bending or twisting in use, or (2) for connecting luminaires to the branch-circuit conductors supplying the luminaires.

Fixture wire is permitted to be used as a tap conductor to connect a luminaire(s) to the branch-circuit conductors. The transition from the branch-circuit wiring method to the fixture wire tap conductors can be accomplished via a junction box or other fitting that is allowed to contain splices.

### 402.11 Uses Not Permitted

Fixture wires shall not be used as branch-circuit conductors except as permitted elsewhere in **this Code**.

The phrase “except as permitted elsewhere in **this Code**” correlates with limited application of fixture wire as branch-circuit conductors found in other sections of the *Code*. One example of such a use is in 725.49(B), where the insulation types required for Class 1 circuits wired with 18 AWG and 16 AWG conductors are the types specified in Table 402.3 for fixture wire.

### 402.12 Overcurrent Protection

Overcurrent protection for fixture wires shall be as specified in 240.5.

## I. Installation

### 404.1 Scope

The provisions of this **article** apply to all switches, switching devices, and circuit breakers used as switches, operating at 600 volts and below, unless specifically referenced elsewhere in **this Code** for higher voltages.

The scope of Article 404 was revised for the 2011 *Code*. The primary purpose of the revision was to eliminate any conflict with Article 490 related to switch height. Section 490.41(B) permits handles for infrequently operated devices to be located over the maximum 6 ft, 7 in. height required by 404.8(A) as long as the handle can be operated from a portable platform. Limiting Article 404 to switches operating at 600 volts or less eliminates that conflict.

### 404.2 Switch Connections

**(A) Three-Way and Four-Way Switches.** Three-way and four-way switches shall be wired so that all switching is done only in the ungrounded circuit conductor. Where in metal raceways or metal-armored cables, wiring between switches and outlets shall be in accordance with 300.20(A).

*Exception: Switch loops shall not require a grounded conductor.*

The use of two 2-conductor nonmetallic-sheathed cables instead of a single 3-conductor cable for wiring three-way and four-way switches is not specifically prohibited by the *Code*. However, using two 2-conductor cables could easily result in a violation of 300.20 if metal boxes are used and the cables enter the box through separate knockouts. Also, use of the same clamp or section of a clamp for both cables would, in most cases, not comply with 110.3(B), because clamps have been tested for only one cable per clamp or section of clamp.

The exception to 404.2 does not require a grounded conductor in a switch loop [see 300.20(A)] because the ungrounded conductor both enters and leaves the enclosure in the same cable or raceway, thus avoiding inductive heating.

**(B) Grounded Conductors.** Switches or circuit breakers shall not disconnect the grounded conductor of a circuit.

*Exception: A switch or circuit breaker shall be permitted to disconnect a grounded circuit conductor where all circuit conductors are disconnected simultaneously, or where the device is arranged so that the grounded conductor cannot be disconnected until all the ungrounded conductors of the circuit have been disconnected.*

**(C) Switches Controlling Lighting Loads.** Where switches control lighting loads supplied by a grounded general purpose branch circuit, the grounded circuit conductor for the controlled lighting circuit shall be provided at the switch location.

*Exception: The grounded circuit conductor shall be permitted to be omitted from the switch enclosure where either of the following conditions in (1) or (2) apply:*

- (1) *Conductors for switches controlling lighting loads enter the box through a raceway. The raceway shall have sufficient cross-sectional area to accommodate the extension of the grounded circuit conductor of the lighting circuit to the switch location whether or not the conductors in the raceway are required to be increased in size to comply with 310.15(B)(3)(a).*
- (2) *Cable assemblies for switches controlling lighting loads enter the box through a framing cavity that is open at the top or bottom on the same floor level, or through a wall, floor, or ceiling that is unfinished on one side.*

**Informational Note:** The provision for a (future) grounded conductor is to complete a circuit path for electronic lighting control devices.

This section is new in the 2011 *Code*. Many electronic lighting control devices require a standby current to maintain the

ready state and detection capability of the device. This allows immediate switching of the load to the “on” condition. These devices require standby current when they are in the “off” state, that is, when there is no load current. Many of these devices utilize the equipment grounding conductor for the standby current flow. Prior to this requirement, a grounded conductor was not usually provided in the switch box for switches controlling lighting loads, so these control devices needed to utilize the equipment grounding conductor to conduct the standby current. Occupancy sensors are permitted by UL 773A, *Standard for Safety of Non-Industrial Photoelectric Switches for Lighting Control*, to have a current of up to 0.5 mA on the equipment grounding conductor. In fact, a number of UL standards permit up to a 0.5 mA ground leakage current as acknowledgment of an operational necessity. This is allowed because the function of an occupancy sensor requires a low level standby current. The standard permits this current on the equipment grounding conductor because in a typical installation there may be no grounded circuit conductor in the switch box that can be used as the return conductor for the standby current. The exception allows two scenarios under which the grounded circuit conductor is not required. In the first scenario, the exception permits the conductor to be omitted in raceway installations where it is practical to add a conductor at the switch location in the future, if needed. The second scenario allows the conductor to be omitted where the construction of the framing cavity in which the switch box is located permits access through which the conductor can be run in the future.

### 404.3 Enclosure

**(A) General.** Switches and circuit breakers shall be of the externally operable type mounted in an enclosure listed for the intended use. The minimum wire-bending space at terminals and minimum gutter space provided in switch enclosures shall be as required in 312.6.

*Exception No. 1: Pendant- and surface-type snap switches and knife switches mounted on an open-face switchboard or panelboard shall be permitted without enclosures.*

*Exception No. 2: Switches and circuit breakers installed in accordance with 110.27(A)(1), (A)(2), (A)(3), or (A)(4) shall be permitted without enclosures.*

Exception No. 2 to 404.3 recognizes the variety of means allowed by 110.27(A) for the guarding of live parts. Switches and circuit breakers guarded by these means are permitted without enclosures.

**(B) Used as a Raceway.** Enclosures shall not be used as junction boxes, auxiliary gutters, or raceways for conductors

feeding through or tapping off to other switches or overcurrent devices, unless the enclosure complies with 312.8.

#### 404.4 Damp or Wet Locations

**(A) Surface-Mounted Switch or Circuit Breaker.** A surface-mounted switch or circuit breaker shall be enclosed in a weatherproof enclosure or cabinet that shall comply with 312.2.

**(B) Flush-Mounted Switch or Circuit Breaker.** A flush-mounted switch or circuit breaker shall be equipped with a weatherproof cover.

**(C) Switches in Tub or Shower Spaces.** Switches shall not be installed within tubs or shower spaces unless installed as part of a listed tub or shower assembly.

This section was rewritten for the 2011 *Code* to improve usability. For most wet locations, surface-mounted switches or circuit breakers must be installed in a weatherproof enclosure. Flush-mounted switches or circuit breakers must have a weatherproof cover. However, in tub and shower spaces, switches must not be installed, unless part of a listed tub or shower assembly. Such an assembly will provide adequate protection from exposure to energized parts.

#### 404.5 Time Switches, Flashers, and Similar Devices

Time switches, flashers, and similar devices shall be of the enclosed type or shall be mounted in cabinets or boxes or equipment enclosures. Energized parts shall be barriered to prevent operator exposure when making manual adjustments or switching.

*Exception: Devices mounted so they are accessible only to qualified persons shall be permitted without barriers, provided they are located within an enclosure such that any energized parts within 152 mm (6.0 in.) of the manual adjustment or switch are covered by suitable barriers.*

#### 404.6 Position and Connection of Switches

**(A) Single-Throw Knife Switches.** Single-throw knife switches shall be placed so that gravity will not tend to close them. Single-throw knife switches, approved for use in the inverted position, shall be provided with an integral mechanical means that ensures that the blades remain in the open position when so set.

**(B) Double-Throw Knife Switches.** Double-throw knife switches shall be permitted to be mounted so that the throw is either vertical or horizontal. Where the throw is vertical,

integral mechanical means shall be provided to hold the blades in the open position when so set.

Sections 404.6(A) and (B) clarify that an integral “mechanical means” that does not necessarily have to be a “locking device” is required for single-throw and double-throw switches to ensure the switch blades remain disengaged regardless of their orientation when the switch is in the “off” (open) position. New switch designs incorporate mechanical means other than a catch or a latch to ensure that the blades cannot accidentally close from the “off” position.

**(C) Connection of Switches.** Single-throw knife switches and switches with butt contacts shall be connected such that their blades are de-energized when the switch is in the open position. Bolted pressure contact switches shall have barriers that prevent inadvertent contact with energized blades. Single-throw knife switches, bolted pressure contact switches, molded case switches, switches with butt contacts, and circuit breakers used as switches shall be connected so that the terminals supplying the load are de-energized when the switch is in the open position.

Bolted pressure switches that have energized blades when open, such as bottom-feed designs, must be provided with barriers or other means to guard against inadvertent contact with the energized blades. This requirement is intended to provide protection against accidental contact with live parts when personnel are working on energized equipment.

*Exception: The blades and terminals supplying the load of a switch shall be permitted to be energized when the switch is in the open position where the switch is connected to circuits or equipment inherently capable of providing a backfeed source of power. For such installations, a permanent sign shall be installed on the switch enclosure or immediately adjacent to open switches with the following words or equivalent: WARNING — LOAD SIDE TERMINALS MAY BE ENERGIZED BY BACKFEED.*

Batteries, generators, PV systems, and double-ended switchboard ties are typical backfeed sources. These sources can cause the load side of the switch or circuit breaker to be energized when it is in the open position, a condition inherent to the circuitry.

#### 404.7 Indicating

General-use and motor-circuit switches, circuit breakers, and molded case switches, where mounted in an enclosure

as described in 404.3, shall clearly indicate whether they are in the open (off) or closed (on) position.

Where these switch or circuit breaker handles are operated vertically rather than rotationally or horizontally, the up position of the handle shall be the (on) position.

*Exception No. 1: Vertically operated double-throw switches shall be permitted to be in the closed (on) position with the handle in either the up or down position.*

*Exception No. 2: On busway installations, tap switches employing a center-pivoting handle shall be permitted to be open or closed with either end of the handle in the up or down position. The switch position shall be clearly indicating and shall be visible from the floor or from the usual point of operation.*

Exception No. 2 clarifies the operation of busway switches that are designed with a center pivot handle such that, at any time, one end of the handle is in the up position and the other is down, which means the handle is pulled down to turn the switch off and also pulled down to turn it on. While this configuration is not in accordance with the requirement in the main rule, the exception permits this time-proven method of operating busway switches.

## 404.8 Accessibility and Grouping

**(A) Location.** All switches and circuit breakers used as switches shall be located so that they may be operated from a readily accessible place. They shall be installed such that the center of the grip of the operating handle of the switch or circuit breaker, when in its highest position, is not more than 2.0 m (6 ft 7 in.) above the floor or working platform.

*Exception No. 1: On busway installations, fused switches and circuit breakers shall be permitted to be located at the same level as the busway. Suitable means shall be provided to operate the handle of the device from the floor.*

*Exception No. 2: Switches and circuit breakers installed adjacent to motors, appliances, or other equipment that they supply shall be permitted to be located higher than 2.0 m (6 ft 7 in.) and to be accessible by portable means.*

*Exception No. 3: Hookstick operable isolating switches shall be permitted at greater heights.*

**(B) Voltage Between Adjacent Devices.** A snap switch shall not be grouped or ganged in enclosures with other snap switches, receptacles, or similar devices, unless they are arranged so that the voltage between adjacent devices does not exceed 300 volts, or unless they are installed in enclosures equipped with identified, securely installed barriers between adjacent devices.

Barriers are required between switches that are ganged in a box and used to control 277-volt lighting on 480Y/277-volt systems where two or more phase conductors enter the box. The barriers would be required between devices fed from two different phases of this system because the voltage between the phase conductors would be 480 volts, nominal, and would exceed the 300-volt limit. Barriers are required even if one device space is left empty because the two remaining devices fed from different phase conductors still would be adjacent to each other. This requirement also applies to switches ganged together with any wiring device where the voltage between adjacent conductors exceeds 300 volts. Where switches or devices are on different systems and are in the same box, such as a switch on a 277-volt system and a receptacle on a 120-volt system, a careful analysis of the voltage between adjacent device terminals is required to ensure that the 300-volt limitation is not exceeded.

**(C) Multipole Snap Switches.** A multipole, general-use snap switch shall not be permitted to be fed from more than a single circuit unless it is listed and marked as a two-circuit or three-circuit switch, or unless its voltage rating is not less than the nominal line-to-line voltage of the system supplying the circuits.

Section 404.8(C) requires multiple-pole snap switches be listed for switching multiple circuits or have a rating not less than the line-to-line system voltage where more than one circuit is being switched. An informational note was added in the 2011 *Code* that refers to 210.7. Where a switch is supplied by more than one circuit, 210.7 requires a means to simultaneously disconnect the ungrounded conductors supplying the switch.

Informational Note: See 210.7 for disconnect requirements where more than one circuit supplies a switch.

## 404.9 Provisions for General-Use Snap Switches

**(A) Faceplates.** Faceplates provided for snap switches mounted in boxes and other enclosures shall be installed so as to completely cover the opening and, where the switch is flush mounted, seat against the finished surface.

**(B) Grounding.** Snap switches, including dimmer and similar control switches, shall be connected to an equipment grounding conductor and shall provide a means to connect metal faceplates to the equipment grounding conductor, whether or not a metal faceplate is installed. Snap switches shall be considered to be part of an effective ground-fault current path if either of the following conditions is met:

- (1) The switch is mounted with metal screws to a metal box or metal cover that is connected to an equipment grounding conductor or to a nonmetallic box with integral means for connecting to an equipment grounding conductor.
- (2) An equipment grounding conductor or equipment bonding jumper is connected to an equipment grounding termination of the snap switch.

*Exception No. 1 to (B): Where no means exists within the snap-switch enclosure for connecting to the equipment grounding conductor, or where the wiring method does not include or provide an equipment grounding conductor, a snap switch without a connection to an equipment grounding conductor shall be permitted for replacement purposes only. A snap switch wired under the provisions of this exception and located within 2.5 m (8 ft) vertically, or 1.5 m (5 ft) horizontally, of ground or exposed grounded metal objects shall be provided with a faceplate of nonconducting non-combustible material with nonmetallic attachment screws, unless the switch mounting strap or yoke is nonmetallic or the circuit is protected by a ground-fault circuit interrupter.*

*Exception No. 2 to (B): Listed kits or listed assemblies shall not be required to be connected to an equipment grounding conductor if all of the following conditions are met:*

- (1) The device is provided with a nonmetallic faceplate that cannot be installed on any other type of device,
- (2) The device does not have mounting means to accept other configurations of faceplates,
- (3) The device is equipped with a nonmetallic yoke, and
- (4) All parts of the device that are accessible after installation of the faceplate are manufactured of nonmetallic materials.

*Exception No. 3 to (B): A snap switch with integral nonmetallic enclosure complying with 300.15(E) shall be permitted without a connection to an equipment grounding conductor.*

The requirements of 404.9(B) specify that switching devices, including snap switches, dimmers, and similar control devices, must be grounded. Although the non-current-carrying metal parts of these devices typically are not subject to contact by personnel, the metal faceplates do pose a shock hazard if they were to become energized. Therefore, the switch must provide a means for connection of an equipment grounding conductor to ground the metal faceplate whether or not one is installed.

Sections 404.9(B)(1) and (B)(2) describe the conditions of installation that meet the requirement for the switch to provide an effective ground fault current path to any installed metal cover plates. Switch plates in existing installa-

tions attached to switches in boxes without an equipment grounding conductor must be made of insulating material. See Exhibit 404.1 for an example of the typical method by which a metal faceplate is grounded.

**EXHIBIT 404.1** Grounding of a metal faceplate through attachment to the grounded yoke of a snap switch.

Exception No. 1 to 404.9(B) requires GFCI protection for the circuits terminating in an ungrounded device box where a metal faceplate that can be touched by persons in contact with a grounded surface is installed. This exception provides additional safety to persons where older electrical installations did not provide an equipment grounding conductor in the wiring method. This exception was revised for the 2011 *Code* to clarify the protection requirements for snap switches within 8 ft vertically or 5 ft horizontally of ground or exposed grounded objects.

Exception No. 2 is new in the 2011 *Code*. It permits listed kits or assemblies of snap switches or other devices with nonmetallic yokes and faceplates to be installed without an equipment grounding or bonding conductor connection. The switch or device assembly is evaluated for dielectric breakdown to ensure there will not be a shock hazard. The requirement for a faceplate that is not interchangeable with other types of faceplates ensures that a conductive

faceplate will not be used on switches that do not provide an equipment grounding means through the yoke. This mirrors the requirement in 406.4(D) for receptacle/faceplate combinations. The yoke is not permitted to have means for mounting faceplates that are not provided as part of the listed assembly. Further protection from shock hazards is provided by the requirement that all parts accessible after installation be manufactured of nonmetallic materials.

Exception No. 3 is also new in the 2011 *Code*. Listed switches of the boxless type incorporate integral nonconductive (nonmetallic) faceplates that do not permit interchange faceplates, which precludes the substitution of a metal faceplate. There is no equipment in the assembly that requires grounding. Therefore, there is no need for an equipment grounding conductor.

**(C) Construction.** Metal faceplates shall be of ferrous metal not less than 0.76 mm (0.030 in.) in thickness or of nonferrous metal not less than 1.02 mm (0.040 in.) in thickness. Faceplates of insulating material shall be noncombustible and not less than 2.54 mm (0.100 in.) in thickness, but they shall be permitted to be less than 2.54 mm (0.100 in.) in thickness if formed or reinforced to provide adequate mechanical strength.

#### 404.10 Mounting of Snap Switches

**(A) Surface Type.** Snap switches used with open wiring on insulators shall be mounted on insulating material that separates the conductors at least 13 mm (½ in.) from the surface wired over.

**(B) Box Mounted.** Flush-type snap switches mounted in boxes that are set back of the finished surface as permitted in 314.20 shall be installed so that the extension plaster ears are seated against the surface. Flush-type snap switches mounted in boxes that are flush with the finished surface or project from it shall be installed so that the mounting yoke or strap of the switch is seated against the box.

Section 404.10(B) makes it clear that regardless of where a box for a flush-type switch is installed (in a wall or in a ceiling), the switch yoke or strap must be seated against the box, or where the box is set back, the yoke or strap must be against the finished surface of the wall, ceiling, or other location in which the box is installed.

#### 404.11 Circuit Breakers as Switches

A hand-operable circuit breaker equipped with a lever or handle, or a power-operated circuit breaker capable of being opened by hand in the event of a power failure, shall be per-

mitted to serve as a switch if it has the required number of poles.

Informational Note: See the provisions contained in 240.81 and 240.83.

Circuit breakers that are capable of being hand operated must clearly indicate whether they are in the open (off) or closed (on) position. See 404.7 for details on handle positions. See 240.83(D) for SWD and HID marking for circuit breakers used as switches for 120-volt and 277-volt fluorescent and high-intensity discharge lighting circuits.

#### 404.12 Grounding of Enclosures

Metal enclosures for switches or circuit breakers shall be connected to an equipment grounding conductor as specified in Part IV of Article 250. Metal enclosures for switches or circuit breakers used as service equipment shall comply with the provisions of Part V of Article 250. Where nonmetallic enclosures are used with metal raceways or metal-armored cables, provision shall be made for connecting the equipment grounding conductor(s).

Except as covered in 404.9(B), Exception No. 1, nonmetallic boxes for switches shall be installed with a wiring method that provides or includes an equipment grounding conductor.

#### 404.13 Knife Switches

**(A) Isolating Switches.** Knife switches rated at over 1200 amperes at 250 volts or less, and at over 600 amperes at 251 to 600 volts, shall be used only as isolating switches and shall not be opened under load.

**(B) To Interrupt Currents.** To interrupt currents over 1200 amperes at 250 volts, nominal, or less, or over 600 amperes at 251 to 600 volts, nominal, a circuit breaker or a switch of special design listed for such purpose shall be used.

**(C) General-Use Switches.** Knife switches of ratings less than specified in 404.13(A) and (B) shall be considered general-use switches.

Informational Note: See the definition of *General-Use Switch* in Article 100.

**(D) Motor-Circuit Switches.** Motor-circuit switches shall be permitted to be of the knife-switch type.

Informational Note: See the definition of a *Motor-Circuit Switch* in Article 100.

#### 404.14 Rating and Use of Snap Switches

Snap switches shall be used within their ratings and as indicated in 404.14(A) through (F).

Informational Note No. 1: For switches on signs and out-line lighting, see 600.6.

Informational Note No. 2: For switches controlling motors, see 430.83, 430.109, and 430.110.

**(A) Alternating-Current General-Use Snap Switch.** A form of general-use snap switch suitable only for use on ac circuits for controlling the following:

- (1) Resistive and inductive loads not exceeding the ampere rating of the switch at the voltage involved
- (2) Tungsten-filament lamp loads not exceeding the ampere rating of the switch at 120 volts
- (3) Motor loads not exceeding 80 percent of the ampere rating of the switch at its rated voltage

**(B) Alternating-Current or Direct-Current General-Use Snap Switch.** A form of general-use snap switch suitable for use on either ac or dc circuits for controlling the following:

- (1) Resistive loads not exceeding the ampere rating of the switch at the voltage applied.
- (2) Inductive loads not exceeding 50 percent of the ampere rating of the switch at the applied voltage. Switches rated in horsepower are suitable for controlling motor loads within their rating at the voltage applied.
- (3) Tungsten-filament lamp loads not exceeding the ampere rating of the switch at the applied voltage if T-rated.

**(C) CO/ALR Snap Switches.** Snap switches rated 20 amperes or less directly connected to aluminum conductors shall be listed and marked CO/ALR.

**(D) Alternating-Current Specific-Use Snap Switches Rated for 347 Volts.** Snap switches rated 347 volts ac shall be listed and shall be used only for controlling the loads permitted by (D)(1) and (D)(2).

**(1) Noninductive Loads.** Noninductive loads other than tungsten-filament lamps not exceeding the ampere and voltage ratings of the switch.

**(2) Inductive Loads.** Inductive loads not exceeding the ampere and voltage ratings of the switch. Where particular load characteristics or limitations are specified as a condition of the listing, those restrictions shall be observed regardless of the ampere rating of the load.

The ampere rating of the switch shall not be less than 15 amperes at a voltage rating of 347 volts ac. Flush-type snap switches rated 347 volts ac shall not be readily interchangeable in box mounting with switches identified in 404.14(A) and (B).

Although not commonly used in the United States, 600Y/347-volt systems are permitted by the *Code*. Sections 210.6 and 225.7(D) permit these systems to be used to supply installations of outdoor lighting. For the purposes of controlling lighting circuits on these systems, 404.14(D)(2) permits a relatively new type of ac specific-use snap switch that is 347-volt rated. Such switches, unless specifically restricted, are permitted to be used on circuits of a lower voltage, such as 277- and 120-volt circuits.

**(E) Dimmer Switches.** General-use dimmer switches shall be used only to control permanently installed incandescent luminaires unless listed for the control of other loads and installed accordingly.

General-use dimmers are not permitted to control receptacles or cord-and-plug-connected table and floor lamps. Section 404.14(E) does not apply to commercial dimmers or theater dimmers that can be used for fluorescent lighting and portable lighting. If a dimmer that has been evaluated only for the control of incandescent luminaires is used, the potential for connecting incompatible equipment such as a cord-and-plug-connected motor-operated appliance or a portable fluorescent lamp is increased by using the dimmer to control a receptacle(s).

**(F) Cord-and-Plug-Connected Loads.** Where a snap switch is used to control cord-and-plug-connected equipment on a general-purpose branch circuit, each snap switch controlling receptacle outlets or cord connectors that are supplied by permanently connected cord pendants shall be rated at not less than the rating of the maximum permitted ampere rating or setting of the overcurrent device protecting the receptacles or cord connectors, as provided in 210.21(B).

Informational Note: See 210.50(A) and 400.7(A)(1) for equivalency to a receptacle outlet of a cord connector that is supplied by a permanently connected cord pendant.

*Exception: Where a snap switch is used to control not more than one receptacle on a branch circuit, the switch shall be permitted to be rated at not less than the rating of the receptacle.*

This section and exception were added in the 2011 *Code*. Section 404.14 requires switches to be used within their rating. This requirement is sufficient where the load is known and hard-wired. Where the load is cord-and-plug-connected through a receptacle or cord connector on a cord pendant (i.e., interchangeable), the load varies based on what is

connected. This new section requires the rating of a switch supplying cord-and-plug-connected loads to be rated at the rating or setting of the overcurrent protective device supplying the branch circuit. The exception recognizes circuits that may have multiple outlets where a switch controls one receptacle on the circuit and adds that such a switch needs only be rated not less than the rating of the receptacle.

## II. Construction Specifications

### 404.15 Marking

**(A) Ratings.** Switches shall be marked with the current, voltage, and, if horsepower rated, the maximum rating for which they are designed.

**(B) Off Indication.** Where in the off position, a switching device with a marked OFF position shall completely disconnect all ungrounded conductors to the load it controls.

### 404.16 600-Volt Knife Switches

Auxiliary contacts of a renewable or quick-break type or the equivalent shall be provided on all knife switches rated 600 volts and designed for use in breaking current over 200 amperes.

### 404.17 Fused Switches

A fused switch shall not have fuses in parallel except as permitted in 240.8.

### 404.18 Wire-Bending Space

The wire-bending space required by 404.3 shall meet Table 312.6(B) spacings to the enclosure wall opposite the line and load terminals.

- 406.14 Tamper-Resistant Receptacles in Child Care Facilities

### 406.1 Scope

This article covers the rating, type, and installation of receptacles, cord connectors, and attachment plugs (cord caps).

### 406.2 Definition

**Child Care Facility.** A building or structure, or portion thereof, for educational, supervisory, or personal care services for more than four children 7 years old or less.

This definition was added in the 2011 *Code*. Sections 406.12, 406.13, 406.14, and 517.18(C) require the use of tamper-resistant receptacles to prevent incidents of electrical burns and shock that result when children insert conductive objects into receptacles. Installing listed tamper-resistant receptacles affords the protection against accidental insertion as part of the permanent wiring system. The requirements for receptacles to be of tamper-resistant construction provides the most effective and permanent means of preventing children from inserting foreign objects into receptacles. The use of tamper-resistant receptacles is also recognized in the U.S. General Services Administration Child Care Center Design Guide (PBS100-July 1993) as a critical design feature for child care areas.

The definition of *child care facility* takes into consideration various aspects of the current definitions for such facilities that appear in building codes, as well as the definition in the U.S. General Services Administration Child Care Center Design Guide.

The statistics provided with the 2005 *NEC* proposal for tamper-resistant receptacles required by 406.12 indicated that approximately 89 percent of the electrical burn and shock incidents occurred to children 6 years of age or less. The current *Code* requirements for tamper-resistant receptacles ensure that children will be protected in closely supervised areas such as pediatric care locations and in less structured residential environments. Section 404.14 extends this requirement to child care areas where young children are normally present for extended periods. Children in child care facilities have ready access to electrical receptacles and the potential hazard for electrical burns and shock exists if a child inserts a foreign object into a receptacle.

### 406.3 Receptacle Rating and Type

**(A) Receptacles.** Receptacles shall be listed and marked with the manufacturer's name or identification and voltage and ampere ratings.

The intent of 406.3(A) is to ensure that the receptacle is suitable for the branch-circuit voltage and the load current that the receptacle must conduct.

**(B) Rating.** Receptacles and cord connectors shall be rated not less than 15 amperes, 125 volts, or 15 amperes, 250 volts, and shall be of a type not suitable for use as lampholders.

Informational Note: See 210.21(B) for receptacle ratings where installed on branch circuits.

**(C) Receptacles for Aluminum Conductors.** Receptacles rated 20 amperes or less and designed for the direct connection of aluminum conductors shall be marked CO/ALR.

Section 406.3(C) requires that 15- and 20-ampere receptacles directly connected to aluminum conductors be suitable for such use. If the receptacle is not of the CO/ALR type, it can be connected with a copper pigtail to an aluminum branch-circuit conductor only if the wire connector is suitable for such a connection and is marked with the letters AL and CU. The commentary following 110.14(B) further explains the suitability of wire connectors used to join copper and aluminum conductors.

**(D) Isolated Ground Receptacles.** Receptacles incorporating an isolated grounding conductor connection intended for the reduction of electrical noise (electromagnetic interference) as permitted in 250.146(D) shall be identified by an orange triangle located on the face of the receptacle.

**(1) Isolated Equipment Grounding Conductor Required.** Receptacles so identified shall be used only with equipment grounding conductors that are isolated in accordance with 250.146(D).

**(2) Installation in Nonmetallic Boxes.** Isolated ground receptacles installed in nonmetallic boxes shall be covered with a nonmetallic faceplate.

*Exception: Where an isolated ground receptacle is installed in a nonmetallic box, a metal faceplate shall be permitted if the box contains a feature or accessory that permits the effective grounding of the faceplate.*

### 406.4 General Installation Requirements

Receptacle outlets shall be located in branch circuits in accordance with Part III of Article 210. General installation requirements shall be in accordance with 406.4(A) through (F).

**(A) Grounding Type.** Receptacles installed on 15- and 20-ampere branch circuits shall be of the grounding type. Grounding-type receptacles shall be installed only on circuits of the voltage class and current for which they are rated, except as provided in Table 210.21(B)(2) and Table 210.21(B)(3).

*Exception: Nongrounding-type receptacles installed in accordance with 406.4(D).*

**(B) To Be Grounded.** Receptacles and cord connectors that have equipment grounding conductor contacts shall have those contacts connected to an equipment grounding conductor.

*Exception No. 1: Receptacles mounted on portable and vehicle-mounted generators in accordance with 250.34.*

*Exception No. 2: Replacement receptacles as permitted by 406.4(D).*

**(C) Methods of Grounding.** The equipment grounding conductor contacts of receptacles and cord connectors shall be grounded by connection to the equipment grounding conductor of the circuit supplying the receptacle or cord connector.

Informational Note: For installation requirements for the reduction of electrical noise, see 250.146(D).

The branch-circuit wiring method shall include or provide an equipment grounding conductor to which the equipment grounding conductor contacts of the receptacle or cord connector are connected.

Informational Note No. 1: See 250.118 for acceptable grounding means.

Informational Note No. 2: For extensions of existing branch circuits, see 250.130.

**(D) Replacements.** Replacement of receptacles shall comply with 406.4(D)(1) through (D)(6), as applicable.

**(1) Grounding-Type Receptacles.** Where a grounding means exists in the receptacle enclosure or an equipment grounding conductor is installed in accordance with 250.130(C), grounding-type receptacles shall be used and shall be connected to the equipment grounding conductor in accordance with 406.4(C) or 250.130(C).

**(2) Non-Grounding-Type Receptacles.** Where attachment to an equipment grounding conductor does not exist in the receptacle enclosure, the installation shall comply with (D)(2)(a), (D)(2)(b), or (D)(2)(c).

(a) A non-grounding-type receptacle(s) shall be permitted to be replaced with another non-grounding-type receptacle(s).

(b) A non-grounding-type receptacle(s) shall be permitted to be replaced with a ground-fault circuit interrupter-type of receptacle(s). These receptacles shall be marked “No Equipment Ground.” An equipment grounding conductor shall not be connected from the ground-fault circuit-interrupter-type receptacle to any outlet supplied from the ground-fault circuit-interrupter receptacle.

(c) A non-grounding-type receptacle(s) shall be permitted to be replaced with a grounding-type receptacle(s) where supplied through a ground-fault circuit interrupter. Grounding-type receptacles supplied through the ground-fault circuit interrupter shall be marked “GFCI Protected” and “No Equipment Ground.” An equipment grounding conductor shall not be connected between the grounding-type receptacles.

**(3) Ground-Fault Circuit-Interrupters.** Ground-fault circuit-interrupter protected receptacles shall be provided where replacements are made at receptacle outlets that are required to be so protected elsewhere in this *Code*.

**(4) Arc-Fault Circuit-Interrupter Protection.** Where a receptacle outlet is supplied by a branch circuit that requires arc-fault circuit interrupter protection as specified elsewhere in this *Code*, a replacement receptacle at this outlet shall be one of the following:

- (1) A listed outlet branch circuit type arc-fault circuit interrupter receptacle
- (2) A receptacle protected by a listed outlet branch circuit type arc-fault circuit interrupter type receptacle
- (3) A receptacle protected by a listed combination type arc-fault circuit interrupter type circuit breaker

This requirement becomes effective January 1, 2014.

This section was revised for the 2011 *Code* by adding new requirements for replacing receptacles in existing installations. Section 406.4(D) addresses receptacle replacement. It now requires arc-fault protected receptacles where required elsewhere in the *NEC*. This is consistent with 406.4(D)(3), which requires GFCI protected receptacles where replacements are made at receptacle outlets that are required to be protected elsewhere in the *NEC*. Older homes are statistically more vulnerable to electrical fires. This revision will provide that extra protection for older homes by requiring the gradual replacement, over time, of non-AFCI-protected receptacles with new AFCI-protected ones.

**(5) Tamper-Resistant Receptacles.** Listed tamper-resistant receptacles shall be provided where replacements are made at receptacle outlets that are required to be tamper-resistant elsewhere in this *Code*.

This section was added in the 2011 *Code*. It requires replacement receptacles to be of the tamper-resistant type if the *Code* would have required a tamper-resistant receptacle for a new installation of the same type. For example, an ordinary 15-ampere receptacle in a bedroom of a 10-year-old one-family dwelling would now be required to be replaced with a tamper-resistant receptacle because tamper-resistant receptacles would have been required in a bedroom of a new home if it were constructed under the current edition of the *Code*. This requirement does not mandate receptacle replacement. It merely institutes a requirement for the receptacle if it is replaced. This revision will provide that extra protection for older installations by requiring the gradual replacement, over time.

**(6) Weather-Resistant Receptacles.** Weather-resistant receptacles shall be provided where replacements are made at receptacle outlets that are required to be so protected elsewhere in this *Code*.

This section is new in the 2011 *Code*. It expands the receptacle replacement requirements to require weather-resistant receptacles where required elsewhere in the *NEC*. This is consistent with the requirement in 406.4(D)(3), which requires GFCI-protected receptacles where replacements are made at receptacle outlets that are required to be so protected elsewhere in the *NEC*. Without the requirement for weather-resistant receptacles to be installed at the time of replacement, ordinary receptacles may be installed and subjected to the same failures as the receptacles they were replacing.

**(E) Cord-and-Plug-Connected Equipment.** The installation of grounding-type receptacles shall not be used as a requirement that all cord-and-plug-connected equipment be of the grounded type.

Informational Note: See 250.114 for types of cord-and-plug-connected equipment to be grounded.

**(F) Noninterchangeable Types.** Receptacles connected to circuits that have different voltages, frequencies, or types of current (ac or dc) on the same premises shall be of such design that the attachment plugs used on these circuits are not interchangeable.

## 406.5 Receptacle Mounting

Receptacles shall be mounted in boxes or assemblies designed for the purpose, and such boxes or assemblies shall be securely fastened in place unless otherwise permitted elsewhere in this *Code*.

Receptacles in pendant boxes are permitted, provided the box is supported from the flexible cord in accordance with 314.23(H)(1). A pendant box that is properly suspended is not required to be securely fastened in place.

**(A) Boxes That Are Set Back.** Receptacles mounted in boxes that are set back from the finished surface as permitted in 314.20 shall be installed such that the mounting yoke or strap of the receptacle is held rigidly at the finished surface.

Section 406.5(A) applies to all finished surfaces where the device box is set back from the finished surface of a wall, a ceiling, or other location within a building.

**(B) Boxes That Are Flush.** Receptacles mounted in boxes that are flush with the finished surface or project therefrom shall be installed such that the mounting yoke or strap of the receptacle is held rigidly against the box or box cover.

To comply with 406.5(B), an outlet box used to enclose a receptacle must be rigidly and securely supported according to 314.23(B) or (C). In addition, mounting outlet boxes with the proper setback, according to 314.20, requires the cooperation of other construction trades (drywall installers, plasterers, and carpenters) and the building designers.

The intent of 406.5(A) through (C) is to allow attachment plugs to be inserted or removed without moving the receptacle. Additionally, by restricting movement of the receptacle, effective grounding continuity can be maintained for contact devices or receptacle yokes where the box is installed flush with the wall surface or where it projects from it. The proper installation of receptacles helps ensure that attachment plugs can be fully inserted, thus providing a better contact.

**(C) Receptacles Mounted on Covers.** Receptacles mounted to and supported by a cover shall be held rigidly against the cover by more than one screw or shall be a device assembly or box cover listed and identified for securing by a single screw.

Receptacles mounted on raised covers, such as the receptacle illustrated in Exhibit 406.1, are not permitted to be secured by a single screw unless listed and identified for the use.

**(D) Position of Receptacle Faces.** After installation, receptacle faces shall be flush with or project from faceplates of insulating material and shall project a minimum of 0.4 mm (0.015 in.) from metal faceplates.

The reason for requiring receptacles to project from metal faceplates is to prevent faults between the blades of attachment plugs and metal faceplates. Proper mounting of faceplates ensures that attachment plugs can be fully inserted, thus providing a better contact. The *NEC* does not specify the position (blades up or blades down) of a common vertically mounted 15- or 20-ampere duplex receptacle. Although many drawings in this handbook show the slots for blades up, the receptacle may be installed with the slots for blades down. Receptacles can also be installed horizontally as well as vertically. Refer to 406.9(B) for information on receptacles installed in wet locations.

**EXHIBIT 406.1** A receptacle mounted on a raised cover secured with three screws.

*Exception: Listed kits or assemblies encompassing receptacles and nonmetallic faceplates that cover the receptacle face, where the plate cannot be installed on any other receptacle, shall be permitted.*

The exception to 406.5(D) allows the use of listed kits that include the receptacle and a nonmetallic faceplate and that have been evaluated by a recognized testing laboratory to ensure that sufficient blade contact is achieved by the attachment plug when inserted in the receptacle. The kit combinations are necessary where the nonmetallic faceplates do not fit the standard style receptacles.

**(E) Receptacles in Countertops and Similar Work Surfaces in Dwelling Units.** Receptacles shall not be installed in a face-up position in countertops or similar work surfaces.

**(F) Exposed Terminals.** Receptacles shall be enclosed so that live wiring terminals are not exposed to contact.

**(G) Voltage Between Adjacent Devices.** A receptacle shall not be grouped or ganged in enclosures with other receptacles, snap switches, or similar devices, unless they are arranged so that the voltage between adjacent devices does not exceed 300 volts, or unless they are installed in enclosures equipped with identified, securely installed barriers between adjacent devices.

#### **406.6 Receptacle Faceplates (Cover Plates)**

Receptacle faceplates shall be installed so as to completely cover the opening and seat against the mounting surface.

Receptacle faceplates mounted inside a box having a recess-mounted receptacle shall effectively close the opening and seat against the mounting surface.

This section was revised for the 2011 *Code* to address recess-mounted receptacles. The faceplates/cover plates for these receptacles must fit the inside dimensions of the box. A small tolerance is required to facilitate installation of the cover plate, typically  $\frac{1}{32}$  in. or less. The recessed design and the very small opening provide the necessary protection against access to live parts. The term *effectively closed* is used to express the intent of the requirement and to recognize the need for some tolerance in application of the requirement.

**(A) Thickness of Metal Faceplates.** Metal faceplates shall be of ferrous metal not less than 0.76 mm (0.030 in.) in thickness or of nonferrous metal not less than 1.02 mm (0.040 in.) in thickness.

**(B) Grounding.** Metal faceplates shall be grounded.

Generally, this requirement is easily met by grounding the metal box. However, isolated ground receptacles installed in nonmetallic boxes are problematic because grounding the receptacle in this case does not ground the faceplate. Section 406.3(D)(2) contains two solutions concerning the receptacle faceplate. First, the general solution is to use only nonmetallic faceplates. Second, the exception to 406.3(D)(2) allows a nonmetallic box manufacturer to add a feature or accessory to accomplish effective grounding of a metal faceplate.

**(C) Faceplates of Insulating Material.** Faceplates of insulating material shall be noncombustible and not less than 2.54 mm (0.10 in.) in thickness but shall be permitted to be less than 2.54 mm (0.10 in.) in thickness if formed or reinforced to provide adequate mechanical strength.

#### **406.7 Attachment Plugs, Cord Connectors, and Flanged Surface Devices**

All attachment plugs, cord connectors, and flanged surface devices (inlets and outlets) shall be listed and marked with the manufacturer's name or identification and voltage and ampere ratings.

Section 406.7 includes requirements governing the use of flanged surface inlet devices or motor base inlet plugs, often called motor plugs.

An energized cord cap is often improperly used to supply power to a building from a portable generator when a power failure occurs. Section 406.7 prohibits the improper use of a cord cap, where the blades are exposed and energized, to supply power to a cord body or plug into a receptacle to backfeed it. Prongs or blades that are exposed to contact by persons must not be energized unless an energized cord connector is installed in a flanged inlet device. Exhibit 406.2 illustrates a flanged inlet device.

**EXHIBIT 406.2** Flanged inlet device. (Courtesy of Legrand/Pass & Seymour®)

**(A) Construction of Attachment Plugs and Cord Connectors.** Attachment plugs and cord connectors shall be constructed so that there are no exposed current-carrying parts except the prongs, blades, or pins. The cover for wire terminations shall be a part that is essential for the operation of an attachment plug or connector (dead-front construction).

**(B) Connection of Attachment Plugs.** Attachment plugs shall be installed so that their prongs, blades, or pins are not energized unless inserted into an energized receptacle or cord connectors. No receptacle shall be installed so as to require the insertion of an energized attachment plug as its source of supply.

The requirements found in 406.7(B) (referred to as dead-front construction) minimize the occurrence of electrical faults between metal plates and attachment plugs with terminal screws exposed on the face of the plug.

The requirements in 406.7(B) were originally found in product information only. However, as an aid to the inspection community, these requirements are now clearly stated in the *NEC*. A live attachment plug cap can be a dangerous

situation. Attachment plug caps should never be installed so as to allow the blades to be energized without being plugged into a device.

**(C) Attachment Plug Ejector Mechanisms.** Attachment plug ejector mechanisms shall not adversely affect engagement of the blades of the attachment plug with the contacts of the receptacle.

Section 406.7(C) permits a device that reduces the likelihood of damage to the cord when the cord is pulled to remove the plug. This device is designed for use by persons with mobility or visual impairment.

**(D) Flanged Surface Inlet.** A flanged surface inlet shall be installed such that the prongs, blades, or pins are not energized unless an energized cord connector is inserted into it.

Section 406.7(D) covers flanged inlet devices and prohibits the prongs, blades, or pins of motor base inlet plugs from being energized before a cord body is inserted in it.

## 406.8 Noninterchangeability

Receptacles, cord connectors, and attachment plugs shall be constructed such that receptacle or cord connectors do not accept an attachment plug with a different voltage or current rating from that for which the device is intended. However, a 20-ampere T-slot receptacle or cord connector shall be permitted to accept a 15-ampere attachment plug of the same voltage rating. Non-grounding-type receptacles and connectors shall not accept grounding-type attachment plugs.

For information on receptacle and attachment cap configurations, see NEMA WD 6-2002, *Wiring Devices — Dimensional Requirements*, available for download at [www.nema.org](http://www.nema.org).

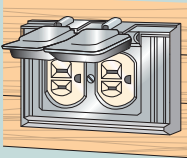

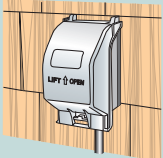

## 406.9 Receptacles in Damp or Wet Locations

The requirements of 406.9(A) and (B) as they apply to the covers that are typically used with lower rated receptacles (15 through 60 amperes) are summarized in Exhibit 406.3.

All 15- and 20-ampere receptacles for both damp and wet locations are required to be a listed weather-resistant type. Studies indicated that normal receptacles were inadequate because covers were either broken off or not closed properly. The major differences between WR and non-WR receptacles are that the WR has additional corrosion protection,

**EXHIBIT 406.3** Requirements for receptacle cover (enclosure) types.

Damp and Wet Receptacle Locations	Receptacle Cover (Enclosure) Type Requirements	
	Cover that is <i>not</i> weatherproof, with attachment plug cap inserted into receptacle	Cover that is weatherproof, with attachment plug cap inserted into receptacle (“in-use” type)
		
406.9(A): Outdoor damp locations	Minimum type required <i>Note: “In-use” type covers permitted</i>	Permitted
406.9(A): Indoor damp locations	Minimum type required <i>Note: “In-use” type covers permitted</i>	Permitted
406.9(B)(1)&(2): Outdoor wet locations	Required for receptacle types other than those rated 15 and 20 amperes, 125 and 250 volts, where the tool, appliance, or other utilization equipment plugged into the receptacle is attended while in use.  <i>Note: “In-use” type covers permitted</i>	(a) Required for receptacles rated 15 and 20 amperes, 125 and 250 volts  (b) Required for receptacles other than those rated 15 and 20 amperes, 125 and 250 volts, where the tool, appliance, or other utilization equipment plugged into the receptacle is <i>not</i> attended while in use.
406.9(B)(2): Indoor wet locations	Required for receptacle types other than those rated 15 and 20 amperes, 125 and 250 volts, where the tool, appliance, or other utilization equipment plugged into the receptacle is attended while in use.  <i>Note: “In-use” type covers permitted</i>	(a) Required for receptacles rated 15 and 20 amperes, 125 and 250 volts  (b) Required for receptacles other than those rated 15 and 20 amperes, 125 and 250 volts, where the tool, appliance, or other utilization equipment plugged into the receptacle is <i>not</i> attended while in use.

UV resistance, and cold impact resistance. A typical WR receptacle is shown in Exhibit 406.4.

**(A) Damp Locations.** A receptacle installed outdoors in a location protected from the weather or in other damp locations shall have an enclosure for the receptacle that is weatherproof when the receptacle is covered (attachment plug cap not inserted and receptacle covers closed).

An installation suitable for wet locations shall also be considered suitable for damp locations.

A receptacle shall be considered to be in a location protected from the weather where located under roofed open porches, canopies, marquees, and the like, and will not be subjected to a beating rain or water runoff. All 15- and 20-ampere, 125- and 250-volt nonlocking receptacles shall be a listed weather-resistant type.

Informational Note: The types of receptacles covered by this requirement are identified as 5-15, 5-20, 6-15, and 6-20

in ANSI/NEMA WD 6-2002, National Electrical Manufacturers Association *Standard for Dimensions of Attachment Plugs and Receptacles*.

**(B) Wet Locations.**

**(1) 15- and 20-Ampere Receptacles in a Wet Location.** 15- and 20-ampere, 125- and 250-volt receptacles installed in a wet location shall have an enclosure that is weatherproof whether or not the attachment plug cap is inserted. For other than one- or two-family dwellings, an outlet box hood installed for this purpose shall be listed, and where installed on an enclosure supported from grade as described in 314.23(B) or as described in 314.23(F) shall be identified as “extra-duty.” All 15- and 20-ampere, 125- and 250-volt nonlocking-type receptacles shall be listed weather-resistant type.

Informational Note No. 1: Requirements for extra-duty outlet box hoods are found in ANSI/UL 514D-2000, *Cover Plates for Flush-Mounted Wiring Devices*.

**EXHIBIT 406.4** Two “WR” receptacles enclosed by a two-gang weatherproof cover suitable for use in wet locations. (Courtesy of Legrand/Pass & Seymour®)

Informational Note No. 2: The types of receptacles covered by this requirement are identified as 5-15, 5-20, 6-15, and 6-20 in ANSI/NEMA WD 6-2002, National Electrical Manufacturers Association *Standard for Dimensions of Attachment Plugs and Receptacles*.

*Exception: 15- and 20-ampere, 125- through 250-volt receptacles installed in a wet location and subject to routine high-pressure spray washing shall be permitted to have an enclosure that is weatherproof when the attachment plug is removed.*

To ensure the weatherproof integrity of the cord-and-plug connection to receptacles located in a wet location, 406.9(B)(1) requires receptacle covers that provide a weatherproof enclosure at all times regardless of whether the plug is inserted. The requirement for this type of cover is not contingent on the anticipated use of the receptacle. This requirement applies to all 15- and 20-ampere, 125- and 250-volt receptacles that are installed in wet locations, including those receptacle outlets at dwelling units specified by 210.52(E). Exhibit 406.5 is an example of the type of receptacle enclosure required by 406.9(B)(1).

This section was revised for the 2011 *Code*. It requires outlet box hoods that are part of a weatherproof enclosure to have “extra duty” durability when the enclosure is mounted on an independent free-standing post, stanchion, pillar, conduit, or support of metal, polymeric, wood brace, or other

**EXHIBIT 406.5** A single-gang weatherproof cover suitable for use in wet locations. (Courtesy of Thomas & Betts Corp.)

rigid material. Outlet box hoods in some installations are more susceptible to damage. Among these are temporary installations in wet locations such as construction job sites. This revision, along with the revision in 590.4(D), will require more durable products to ensure that the degree of protection for receptacles envisioned by the requirement in 406.9(B) will be retained in these harsher use environments.

**(2) Other Receptacles.** All other receptacles installed in a wet location shall comply with (B)(2)(a) or (B)(2)(b).

(a) A receptacle installed in a wet location, where the product intended to be plugged into it is not attended while in use, shall have an enclosure that is weatherproof with the attachment plug inserted or removed.

(b) A receptacle installed in a wet location where the product intended to be plugged into it will be attended while in use (e.g., portable tools) shall have an enclosure that is weatherproof when the attachment plug is removed.

Section 406.9(B)(2)(a) applies to receptacles other than those rated 15 and 20 amperes, 125 and 250 volts, that supply cord-and-plug-connected equipment likely to be used outdoors or in a wet location for long periods of time. A portable pump motor is an example of such equipment. Receptacles for this application should remain weatherproof while they are in use.

Section 406.9(B)(2)(b) applies to receptacles other than those rated 15 and 20 amperes, 125 and 250 volts, that supply cord-and-plug-connected portable tools or other portable equipment likely to be used outdoors for a specific purpose and then removed.

**(C) Bathtub and Shower Space.** Receptacles shall not be installed within or directly over a bathtub or shower stall.

Section 406.9(C) prohibits the installation of receptacles inside bathtub and shower spaces or above their footprint, even if the receptacles are installed in a weatherproof enclosure. Prohibiting such installation helps minimize the use of shavers, radios, hair dryers, and so on, in these areas.

The unprotected-line side of GFCI-protected receptacles installed in bathtub and shower spaces could possibly become wet and therefore create a shock hazard by energizing surrounding wet surfaces.

**(D) Protection for Floor Receptacles.** Standpipes of floor receptacles shall allow floor-cleaning equipment to be operated without damage to receptacles.

**(E) Flush Mounting with Faceplate.** The enclosure for a receptacle installed in an outlet box flush-mounted in a finished surface shall be made weatherproof by means of a weatherproof faceplate assembly that provides a watertight connection between the plate and the finished surface.

## 406.10 Grounding-Type Receptacles, Adapters, Cord Connectors, and Attachment Plugs

**(A) Grounding Poles.** Grounding-type receptacles, cord connectors, and attachment plugs shall be provided with one fixed grounding pole in addition to the circuit poles. The grounding contacting pole of grounding-type plug-in ground-fault circuit interrupters shall be permitted to be of the movable, self-restoring type on circuits operating at not over 150 volts between any two conductors or any conductor and ground.

**(B) Grounding-Pole Identification.** Grounding-type receptacles, adapters, cord connections, and attachment plugs shall have a means for connection of an equipment grounding conductor to the grounding pole.

A terminal for connection to the grounding pole shall be designated by one of the following:

- (1) A green-colored hexagonal-headed or -shaped terminal screw or nut, not readily removable.

- (2) A green-colored pressure wire connector body (a wire barrel).
- (3) A similar green-colored connection device, in the case of adapters. The grounding terminal of a grounding adapter shall be a green-colored rigid ear, lug, or similar device. The equipment grounding connection shall be so designed that it cannot make contact with current-carrying parts of the receptacle, adapter, or attachment plug. The adapter shall be polarized.
- (4) If the terminal for the equipment grounding conductor is not visible, the conductor entrance hole shall be marked with the word *green* or *ground*, the letters *G* or *GR*, a grounding symbol, or otherwise identified by a distinctive green color. If the terminal for the equipment grounding conductor is readily removable, the area adjacent to the terminal shall be similarly marked.

Informational Note: See Informational Note Figure 406.10(B)(4).

### INFORMATIONAL NOTE FIGURE 406.10(B)(4) One Example of a Symbol Used to Identify the Termination Point for an Equipment Grounding Conductor.

Section 406.10(B)(3) requires the grounding terminal of an adapter to be a green-colored ear, lug, or similar device, thereby prohibiting use of an adapter with an attached pigtail grounding wire, which had been used for many years.

**(C) Grounding Terminal Use.** A grounding terminal shall not be used for purposes other than grounding.

**(D) Grounding-Pole Requirements.** Grounding-type attachment plugs and mating cord connectors and receptacles shall be designed such that the equipment grounding connection is made before the current-carrying connections. Grounding-type devices shall be so designed that grounding poles of attachment plugs cannot be brought into contact with current-carrying parts of receptacles or cord connectors.

The grounding blade of the attachment plug cap of most grounding-type combinations is longer than the circuit conductor blades and is used to ensure a “make-first, break-last” grounding connection. In some non-ANSI-approved pin-and-sleeve-type connections, the grounding contact of the receptacle is closer to the face of the receptacle than it is to other contacts, serving the same purpose.

(E) **Use.** Grounding-type attachment plugs shall be used only with a cord having an equipment grounding conductor.

Informational Note: See 200.10(B) for identification of grounded conductor terminals.

#### 406.11 Connecting Receptacle Grounding Terminal to Box

The connection of the receptacle grounding terminal shall comply with 250.146.

#### 406.12 Tamper-Resistant Receptacles for Dwelling Units

In all areas specified in 210.52, all nonlocking-type 125-volt, 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.

*Exception: Receptacles in the following locations shall not be required to be tamper-resistant:*

- (1) Receptacles located more than 1.7 m (5½ ft) above the floor.
- (2) Receptacles that are part of a luminaire or appliance.
- (3) A single receptacle or a duplex receptacle for two appliances located within dedicated space for each appliance that, in normal use, is not easily moved from one place to another and that is cord-and-plug connected in accordance with 400.7(A)(6), (A)(7), or (A)(8).

- (4) Nongrounding receptacles used for replacements as permitted in 406.4(D)(2)(a).

The requirement for tamper-resistant 15- and 20-ampere receptacles in dwelling units is intended to increase safety for children. All areas specified in 210.52, as well as the pediatric areas in Article 517, need tamper-resistant receptacles. Exhibit 406.6 shows a typical tamper-resistant receptacle.

This section was revised for the 2011 *Code*. It now exempts locking-type receptacles from the requirement for tamper resistance. An exception was added to exempt certain receptacles from the requirement. Only those receptacles installed at a height below 1.7 m (5½ ft) can meet the requirements in 210.52 for wall spacing. Receptacles installed above 1.7 m (5½ ft) are not accessible and well out of reach of small children. By allowing the exception for a single receptacle or duplex receptacle located within dedicated space, this wording eliminates the need for tamper-resistant receptacles to be installed behind dishwashers, refrigerators, washing machines, and the like. Nongrounding-type receptacles were exempted because there are no known 125-volt, 15- or 20-ampere nongrounding-type receptacles listed as tamper-resistant receptacles.

**EXHIBIT 406.6** Tamper-resistant receptacle. Insertion of an object in any one side does not open the shutter (left), but a two-bladed plug or grounding plug compresses the spring and simultaneously opens both shutters (right). (Courtesy of Legrand/Pass & Seymour®)

### 406.13 Tamper-Resistant Receptacles in Guest Rooms and Guest Suites

All nonlocking-type, 125-volt, 15- and 20-ampere receptacles located in guest rooms and guest suites shall be listed tamper-resistant receptacles.

This section is new in the 2011 *Code*. Section 406.12 requires listed tamper-resistant receptacles in all areas specified in 210.52 for dwelling units to increase the level of safety for children. Since guest rooms or guest suites in hotels and motels are also likely to be occupied by children, this section requires the same level of protection

### 406.14 Tamper-Resistant Receptacles in Child Care Facilities

In all child care facilities, all nonlocking-type, 125-volt, 15- and 20- ampere receptacles shall be listed tamper-resistant receptacles.

This section is new in the 2011 *Code*, along with the new definition of *child care facility* in 406.2. See the commentary following the definition in 406.2.

### I. General

#### 408.1 Scope

This article covers switchboards and panelboards. It does not apply to equipment operating at over 600 volts, except as specifically referenced elsewhere in the *Code*.

See the definitions of *switchboard* and *panelboard* in Article 100. The scope of Article 408 was revised for the 2011 *Code*. The terms *distribution boards* and *battery-charging panels* were removed from the scope of the article. The scope was also clarified to indicate that it normally does not apply to equipment operating over 600 volts unless a specific provision is cited elsewhere. The deletion of the language on battery-charging panels follows from the deletion of the phrase “light and power circuits.” Any switchboard or panelboard that meets the applicable definition in Article 100 should be and now will be covered in this article, regardless of the specific loads it supplies.

For systems operating over 600 volts, Article 490 is the appropriate article for equipment requirements.

### 408.2 Other Articles

Switches, circuit breakers, and overcurrent devices used on switchboards and panelboards and their enclosures shall comply with this article and also with the requirements of Articles 240, 250, 312, 314, 404, and other articles that apply. Switchboards and panelboards in hazardous (classified) locations shall comply with the applicable provisions of Articles 500 through 517.

### 408.3 Support and Arrangement of Busbars and Conductors

**(A) Conductors and Busbars on a Switchboard or Panelboard.** Conductors and busbars on a switchboard or panelboard shall comply with 408.3(A)(1), (A)(2), and (A)(3) as applicable.

**(1) Location.** Conductors and busbars shall be located so as to be free from physical damage and shall be held firmly in place.

**(2) Service Switchboards.** Barriers shall be placed in all service switchboards such that no uninsulated, ungrounded service busbar or service terminal is exposed to inadvertent contact by persons or maintenance equipment while servicing load terminations.

Where it can be demonstrated that it is unfeasible to disconnect or de-energize the service conductors supplying a service switchboard, qualified electricians may be required to work on these switchboards with the load terminals de-energized but with the service bus energized. Barriers are required in service switchboards to provide physical separation (adequate distance or an obstacle) between load terminals and the service busbars and terminals, thus providing some measure of safety against inadvertent contact with line-energized parts during maintenance and installation of new feeders or branch circuits. In most multisection switchboards, barriers are not required, because the line-side conductors and busbars are not in the same switchboard sections that contain the load terminals.

De-energizing the load side of a switchboard by operation of the disconnecting means does not de-energize the ungrounded service conductors. Every effort should be made to completely disconnect power from the equipment before performing any work inside. If complete disconnection is not feasible, the installer should become familiar with *NFPA 70E®*, *Standard for Electrical Safety in the Workplace®*. This industry-recognized document provides guidance for per-

sonal protective equipment and appropriate work rules that must be followed for working on or near energized equipment.

**(3) Same Vertical Section.** Other than the required interconnections and control wiring, only those conductors that are intended for termination in a vertical section of a switchboard shall be located in that section.

*Exception: Conductors shall be permitted to travel horizontally through vertical sections of switchboards where such conductors are isolated from busbars by a barrier.*

Horizontal travel of conductors through more than one section of a multisection switchboard is necessary where a raceway or cable entry is made into a switchboard section other than the one at which the conductors are terminated.

**(B) Overheating and Inductive Effects.** The arrangement of busbars and conductors shall be such as to avoid overheating due to inductive effects.

**(C) Used as Service Equipment.** Each switchboard or panelboard, if used as service equipment, shall be provided with a main bonding jumper sized in accordance with 250.28(D) or the equivalent placed within the panelboard or one of the sections of the switchboard for connecting the grounded service conductor on its supply side to the switchboard or panelboard frame. All sections of a switchboard shall be bonded together using an equipment bonding conductor sized in accordance with Table 250.122 or Table 250.66 as appropriate.

*Exception: Switchboards and panelboards used as service equipment on high-impedance grounded-neutral systems in accordance with 250.36 shall not be required to be provided with a main bonding jumper.*

**(D) Terminals.** In switchboards and panelboards, load terminals for field wiring, including grounded circuit conductor load terminals and connections to the equipment grounding conductor bus for load equipment grounding conductors, shall be so located that it is not necessary to reach across or beyond an uninsulated ungrounded line bus in order to make connections.

**(E) Phase Arrangement.** The phase arrangement on 3-phase buses shall be A, B, C from front to back, top to bottom, or left to right, as viewed from the front of the switchboard or panelboard. The B phase shall be that phase having the higher voltage to ground on 3-phase, 4-wire,

delta-connected systems. Other busbar arrangements shall be permitted for additions to existing installations and shall be marked.

Section 408.3(E) addresses the phase arrangement of 3-phase buses. The high leg is common on a 240/120-volt, 3-phase, 4-wire delta system and is typically designated as “B phase.” Section 110.15 requires the high-leg marking to be the color orange or other similar effective means of identification.

The exception to 408.3(E) permits the phase leg having the higher voltage to ground to be located at the right-hand position (C phase), making it unnecessary to transpose the panelboard or switchboard busbar arrangement ahead of and beyond a metering compartment. The exception recognizes the fact that metering compartments have been standardized with the high leg at the right position (C phase) rather than in the center on B phase.

See also 110.15 and 230.56 for further information on identifying conductors with the higher voltage to ground. Other busbar arrangements for making additions to existing installations are permitted by 408.3(E).

*Exception: Equipment within the same single section or multisection switchboard or panelboard as the meter on 3-phase, 4-wire, delta-connected systems shall be permitted to have the same phase configuration as the metering equipment.*

Informational Note: See 110.15 for requirements on marking the busbar or phase conductor having the higher voltage to ground where supplied from a 4-wire, delta-connected system.

#### (F) Switchboard or Panelboard Identification.

**(1) High-Leg Identification.** A switchboard or panelboard containing a 4-wire, delta-connected system where the mid-point of one phase winding is grounded shall be legibly and permanently field marked as follows:

“Caution \_\_\_\_\_ Phase Has \_\_\_\_\_ Volts to Ground”

The requirement of 408.3(F) to legibly mark a panelboard that contains a 4-wire delta system is the result of reports of injury and property damage because people do not recognize there is a high leg in the panelboard. This requirement eliminates some of the hazards of accidentally connecting outlets to the high leg and causing injury to people and damage to equipment.

**(2) Ungrounded Systems.** A switchboard or panelboard containing an ungrounded electrical system as permitted in

250.21 shall be legibly and permanently field marked as follows:

“Caution Ungrounded System Operating — \_\_\_\_\_ Volts Between Conductors”

This section is new in the 2011 *Code*. The intent of this requirement is to clearly delineate grounded from ungrounded electrical systems. When a ground fault occurs on a 3-phase-ungrounded system, the voltage to ground on the ungrounded system may equal the line-to-line voltage. The operational advantage of using an ungrounded system is continuity of operation, which in some processes might create a safer condition than would be achieved by automatic or unplanned opening of the supply circuit. Section 250.21(B) requires ungrounded systems of not less than 120 volts and not more than 1000 volts to be provided with ground detection. Ground detection will warn of the ground fault to permit an orderly shutdown of a process.

**(G) Minimum Wire-Bending Space.** The minimum wire-bending space at terminals and minimum gutter space provided in panelboards and switchboards shall be as required in 312.6.

### 408.4 Field Identification Required

**(A) Circuit Directory or Circuit Identification.** Every circuit and circuit modification shall be legibly identified as to its clear, evident, and specific purpose or use. The identification shall include sufficient detail to allow each circuit to be distinguished from all others. Spare positions that contain unused overcurrent devices or switches shall be described accordingly. The identification shall be included in a circuit directory that is located on the face or inside of the panel door in the case of a panelboard, and located at each switch or circuit breaker in a switchboard. No circuit shall be described in a manner that depends on transient conditions of occupancy.

The requirement to provide an up-to-date, accurate, and legible circuit directory applies to panelboards and switchboards covered in Article 408. The circuit directory is an important feature for the safe operation of an electrical system under normal and emergency conditions. The purpose of an accurate and legible circuit directory in these types of equipment is to provide clear identification of circuit breakers and switches that may need to be operated by service personnel or others responding who need to operate a switch or circuit breaker in an emergency. This requirement is specific to switchboards and panelboards; however, the identification requirements of 110.22 apply to all disconnecting means.

Section 408.4 requires that the identification for every circuit supplied by a panelboard or switchboard be legible and clearly state the specific purpose for which the circuit is used.

Circuits used for the same purpose must be identified as to their location. For example, small-appliance branch circuits can supply outlets in the kitchen, dining room, and kitchen countertops. Identifying these circuits as small-appliance branch circuits is not acceptable; instead, they should be identified as “kitchen wall receptacles,” “dining room floor receptacle,” or “kitchen countertop receptacles left of sink.” Circuit directories containing multiple entries with only “lights” or “outlets” do not provide the sufficient detail required by this section.

Spare devices are required to be marked to indicate that they are spares. Markings are required to indicate permanent features and not temporary conditions of occupancy. For example, a circuit breaker supplying an office and labeled with the name of the employee loses meaning when the employee no longer occupies that office.

**(B) Source of Supply.** All switchboards and panelboards supplied by a feeder in other than one- or two-family dwellings shall be marked to indicate the device or equipment where the power supply originates.

This requirement is new in the 2011 *Code*. Often, electricians have had to trace a feeder circuit back to its originating switchboard, switchgear panelboard, or other source, which can be a time-consuming and inaccurate process. Accurate identification of circuits promotes more efficient lockout/tagout processes, which of course provide a safer work environment for employees. Identification of the feeder circuit when the new feeder is being added is also more economical than the time-consuming process of tracing a circuit.

#### 408.5 Clearance for Conductor Entering Bus Enclosures

Where conduits or other raceways enter a switchboard, floor-standing panelboard, or similar enclosure at the bottom, sufficient space shall be provided to permit installation of conductors in the enclosure. The wiring space shall not be less than shown in Table 408.5 where the conduit or raceways enter or leave the enclosure below the busbars, their supports, or other obstructions. The conduit or raceways, including their end fittings, shall not rise more than 75 mm (3 in.) above the bottom of the enclosure.

#### 408.7 Unused Openings

Unused openings for circuit breakers and switches shall be closed using identified closures, or other approved means

**TABLE 408.5 Clearance for Conductors Entering Bus Enclosures**

Conductor	Minimum Spacing Between Bottom of Enclosure and Busbars, Their Supports, or Other Obstructions	
	mm	in.
Insulated busbars, their supports, or other obstructions	200	8
Noninsulated busbars	250	10

that provide protection substantially equivalent to the wall of the enclosure.

The requirement of 408.7 for closing unused switch and circuit breaker openings is specific to the equipment covered within the scope of Article 408. In addition, the requirement of 110.12(A) for closing unused openings, other than those provided for equipment mounting or drainage, applies to all electrical enclosures, including panelboard cabinets and switchboard enclosures. An unused opening may exist as a result of a renovation or an alteration of existing equipment. These two requirements are necessary to restore the electrical equipment enclosure integrity to a condition that minimizes the possibility of an escaping arc, spark, or molten metal igniting surrounding combustible material and also minimizes the potential for accidental contact with live parts.

## II. Switchboards

### 408.16 Switchboards in Damp or Wet Locations

Switchboards in damp or wet locations shall be installed in accordance with 312.2.

### 408.17 Location Relative to Easily Ignitable Material

Switchboards shall be placed so as to reduce to a minimum the probability of communicating fire to adjacent combustible materials. Where installed over a combustible floor, suitable protection thereto shall be provided.

Where flooring is combustible, one method of compliance is to form and attach a piece of sheet steel or other suitable noncombustible material to the floor under the electrical equipment.

### 408.18 Clearances

**(A) From Ceiling.** For other than a totally enclosed switchboard, a space not less than 900 mm (3 ft) shall be provided between the top of the switchboard and any combustible ceiling, unless a noncombustible shield is provided between the switchboard and the ceiling.

**(B) Around Switchboards.** Clearances around switchboards shall comply with the provisions of 110.26.

Sufficient access and working space are required by 408.18 to permit safe operation and maintenance of switchboards. Table 110.26(A)(1) indicates minimum working clearances from 0 to 600 volts, and Table 110.34(A) is used for voltages over 600 volts.

### 408.19 Conductor Insulation

An insulated conductor used within a switchboard shall be listed, shall be flame retardant, and shall be rated not less than the voltage applied to it and not less than the voltage applied to other conductors or busbars with which it may come in contact.

### 408.20 Location of Switchboards

Switchboards that have any exposed live parts shall be located in permanently dry locations and then only where under competent supervision and accessible only to qualified persons. Switchboards shall be located such that the probability of damage from equipment or processes is reduced to a minimum.

### 408.22 Grounding of Instruments, Relays, Meters, and Instrument Transformers on Switchboards

Instruments, relays, meters, and instrument transformers located on switchboards shall be grounded as specified in 250.170 through 250.178.

## III. Panelboards

### 408.30 General

All panelboards shall have a rating not less than the minimum feeder capacity required for the load calculated in accordance with Part III, IV, or V of Article 220, as applicable.

Informational Note: See 110.22 for additional requirements.

Many panelboards are suitable for use as service equipment and are so marked by the manufacturer.

Listed panelboards are used with copper conductors, unless they are marked to indicate which terminals are suitable for use with aluminum conductors. Such marking must be independent of any marking on terminal connectors and must appear on a wiring diagram or other readily visible location. If all terminals are suitable for use with aluminum conductors as well as with copper conductors, the panelboard is marked "Use Copper or Aluminum Wire." A panelboard using terminals or main or branch-circuit units individually marked AL-CU is marked "Use Copper or Aluminum Wire" or "Use Copper Wire Only." The latter marking indicates that wiring space or other factors make the panelboard unsuitable for aluminum conductors. [See 110.14(C).]

Unless a panelboard is marked to indicate otherwise, the termination provisions are based on the use of 60°C ampacities for wire sizes 14 AWG through 1 AWG and 75°C ampacities for wire sizes 1/0 AWG and larger.

Beginning with the 2008 *Code*, the terms *lighting and appliance branch-circuit panelboards* and *power panelboards* are no longer used. In addition, the requirement for a maximum of 42 overcurrent devices was also removed (see 408.54) and now applies only with Exception No. 2 of 408.36. All panelboards need a single overcurrent device that protects the panelboard bus unless either of the exceptions of 408.36 applies.

### 408.36 Overcurrent Protection

In addition to the requirement of 408.30, a panelboard shall be protected by an overcurrent protective device having a rating not greater than that of the panelboard. This overcurrent protective device shall be located within or at any point on the supply side of the panelboard.

The main overcurrent protection device may be an integral part of a panelboard or may be located remote from the panelboard. Exhibit 408.1 shows a panelboard with a main circuit breaker and provisions for inserting 60 circuit breakers. Exhibit 408.2 illustrates overcurrent protection for the panelboard feeders having a rating not greater than the rating of the panelboard.

If a panelboard is required to have overcurrent protection, such protection can be provided by an overcurrent device in the panelboard or by an overcurrent device protecting the conductors that supply the panelboard. In either case, the rating of the overcurrent device is not permitted to exceed the rating of the panelboard. For example, a feeder protected by a 450-ampere overcurrent device supplies a panelboard with a 600-ampere rating. Because the panelboard is large enough to supply the calculated load and the overcurrent de-

**EXHIBIT 408.1** A panelboard with main circuit breaker disconnect, suitable for use as service equipment. (Courtesy of Schneider Electric)

vice protecting the feeder does not exceed the rating of the panelboard, an individual overcurrent device in the panelboard is not required.

*Exception No. 1: Individual protection shall not be required for a panelboard used as service equipment with multiple disconnecting means in accordance with 230.71. In panelboards protected by three or more main circuit breakers or sets of fuses, the circuit breakers or sets of fuses shall not supply a second bus structure within the same panelboard assembly.*

*Exception No. 2: Individual protection shall not be required for a panelboard protected on its supply side by two main circuit breakers or two sets of fuses having a combined rating not greater than that of the panelboard. A panelboard constructed or wired under this exception shall not contain more than 42 overcurrent devices. For the purposes of determining the maximum of 42 overcurrent devices, a 2-pole or a 3-pole circuit breaker shall be considered as two or three overcurrent devices, respectively.*

*Exception No. 3: For existing panelboards, individual protection shall not be required for a panelboard used as service equipment for an individual residential occupancy.*

**(A) Snap Switches Rated at 30 Amperes or Less.** Panelboards equipped with snap switches rated at 30 amperes or less shall have overcurrent protection of 200 amperes or less.

The requirement of 408.36(A) is limited to snap switches; it does not apply to panelboards equipped with circuit breakers.

**(B) Supplied Through a Transformer.** Where a panelboard is supplied through a transformer, the overcurrent protection required by 408.36 shall be located on the secondary side of the transformer.

**EXHIBIT 408.2** An arrangement of three individual panelboards with main overcurrent protection per 408.36 remote from the panelboards.

MLO = Main lug only

*Exception: A panelboard supplied by the secondary side of a transformer shall be considered as protected by the overcurrent protection provided on the primary side of the transformer where that protection is in accordance with 240.21(C)(1).*

**(C) Delta Breakers.** A 3-phase disconnect or overcurrent device shall not be connected to the bus of any panelboard that has less than 3-phase buses. Delta breakers shall not be installed in panelboards.

**(D) Back-Fed Devices.** Plug-in-type overcurrent protection devices or plug-in type main lug assemblies that are backfed and used to terminate field-installed ungrounded supply conductors shall be secured in place by an additional fastener that requires other than a pull to release the device from the mounting means on the panel.

### 408.37 Panelboards in Damp or Wet Locations

Panelboards in damp or wet locations shall be installed to comply with 312.2.

### 408.38 Enclosure

Panelboards shall be mounted in cabinets, cutout boxes, or enclosures designed for the purpose and shall be dead-front.

*Exception: Panelboards other than of the dead-front, externally operable type shall be permitted where accessible only to qualified persons.*

### 408.39 Relative Arrangement of Switches and Fuses

In panelboards, fuses of any type shall be installed on the load side of any switches.

*Exception: Fuses installed as part of service equipment in accordance with the provisions of 230.94 shall be permitted on the line side of the service switch.*

Sections 230.82 and 230.94 permit the service switch to be located on either the supply side or the load side of fuses such as cable limiters and other current-limiting devices. Where fuses of panelboards are accessible to other than qualified persons, such as occupants of a multifamily dwelling, 240.40 requires that disconnecting means be located on the supply side of all fuses in circuits of over 150 volts to ground and in cartridge-type fuses in circuits of any voltage. Thus, when the disconnect switch is opened, the fuses are de-energized, and danger from shock is reduced.

### 408.40 Grounding of Panelboards

Panelboard cabinets and panelboard frames, if of metal, shall be in physical contact with each other and shall be connected to an equipment grounding conductor. Where the panelboard is used with nonmetallic raceway or cable or where separate equipment grounding conductors are provided, a terminal bar for the equipment grounding conductors shall be secured inside the cabinet. The terminal bar shall be bonded to the cabinet and panelboard frame, if of metal; otherwise it shall be connected to the equipment grounding conductor that is run with the conductors feeding the panelboard.

Section 408.40 requires metal panelboard cabinets, frames, and so on, to be connected to an equipment grounding conductor, not merely “grounded.” A separate equipment grounding conductor terminal bar must be installed and bonded to the panelboard for the termination of feeder and branch-circuit equipment grounding conductors. Where installed within service equipment, this terminal is bonded to the neutral terminal bar. Any other connection between the equipment grounding terminal bar and the neutral bar, other than allowed in 250.32, is not permitted. If this downstream connection occurs, current in the neutral or grounded conductor would take parallel paths through the equipment grounding conductors (the raceway, the building structure, or earth, for example) back to the service equipment. Normal load currents on the equipment grounding conductors could create a shock hazard. Exposed metal parts of equipment could have a potential difference of several volts created by the load current on the grounding conductors. Another safety hazard created by this effect, where subpanels are used, is arcing or loose connections at connectors and raceway fittings, creating a potential fire hazard.

*Exception: Where an isolated equipment grounding conductor is provided as permitted by 250.146(D), the insulated equipment grounding conductor that is run with the circuit conductors shall be permitted to pass through the panelboard without being connected to the panelboard’s equipment grounding terminal bar.*

Equipment grounding conductors shall not be connected to a terminal bar provided for grounded conductors or neutral conductors unless the bar is identified for the purpose and is located where interconnection between equipment grounding conductors and grounded circuit conductors is permitted or required by Article 250.

The grounding of electronic equipment and overall power quality are of concern to the electrical industry. Sensitive

electronic equipment used in industrial and commercial power systems may fail to perform properly if electrical noise is present in the equipment grounding conductor.

The exception to 408.40 permits an isolated equipment grounding terminal, if it is necessary for the reduction of electrical noise on the grounding circuit. This equipment grounding terminal must be grounded by an insulated equipment grounding conductor that is run with the circuit conductors. The isolated equipment grounding conductor is also permitted to pass through one or more panelboards (without connection to the panelboard grounding terminal), but it is important that the equipment grounding conductor terminate directly at the applicable separately derived system or service grounding terminal. If the isolated equipment grounding conductor is run in a separate building, however, 250.146(D) requires the isolated equipment grounding conductor to terminate at a panelboard within the same building.

A connection only to a separate grounding electrode that places the earth in the fault return path prevents an insufficient level of ground-fault current to open the overcurrent protective device when a ground fault occurs. See the commentary following the informational note to 250.146(D) and 250.54.

#### 408.41 Grounded Conductor Terminations

Each grounded conductor shall terminate within the panelboard in an individual terminal that is not also used for another conductor.

In accordance with their listing and the requirement of 110.14(A), conductor terminations are only suitable for a single conductor unless the terminal is marked or otherwise identified as suitable for more than one conductor. The use of a single termination point within a panelboard to connect more than one grounded conductor or to connect a grounded conductor and an equipment grounding conductor can be problematic when it is necessary to isolate a particular grounded conductor for testing purposes. For example, if the grounded conductors of two branch circuits were terminated at a single connection point and it were necessary to isolate one branch circuit for the purposes of troubleshooting, the fact that the circuit not being tested remained energized could create an unsafe working condition for service personnel disconnecting the grounded conductor of the circuit being tested. In some cases, panelboard instructions are provided that permit the use of a single-conductor termination for more than one equipment grounding conductor. See 408.40 for the requirements on panelboard terminations for grounded and equipment grounding conductors.

*Exception: Grounded conductors of circuits with parallel conductors shall be permitted to terminate in a single termi-*

*nal if the terminal is identified for connection of more than one conductor.*

## IV. Construction Specifications

### 408.50 Panels

The panels of switchboards shall be made of moisture-resistant, noncombustible material.

### 408.51 Busbars

Insulated or bare busbars shall be rigidly mounted.

### 408.52 Protection of Instrument Circuits

Instruments, pilot lights, potential transformers, and other switchboard devices with potential coils shall be supplied by a circuit that is protected by standard overcurrent devices rated 15 amperes or less.

*Exception No. 1: Overcurrent devices rated more than 15 amperes shall be permitted where the interruption of the circuit could create a hazard. Short-circuit protection shall be provided.*

*Exception No. 2: For ratings of 2 amperes or less, special types of enclosed fuses shall be permitted.*

### 408.53 Component Parts

Switches, fuses, and fuseholders used on panelboards shall comply with the applicable requirements of Articles 240 and 404.

### 408.54 Maximum Number of Overcurrent Devices

A panelboard shall be provided with physical means to prevent the installation of more overcurrent devices than that number for which the panelboard was designed, rated, and listed.

For the purposes of this section, a 2-pole circuit breaker or fusible switch shall be considered two overcurrent devices; a 3-pole circuit breaker or fusible switch shall be considered three overcurrent devices.

Section 408.54 limits the number of overcurrent devices to the quantity for which it was designed, rated, and listed. See Exception No. 2 to 408.36 for restrictions on the number. See also the commentary following 408.30.

### 408.55 Wire-Bending Space Within an Enclosure Containing a Panelboard

The enclosure for a panelboard shall have the top and bottom wire-bending space sized in accordance with Table 312.6(B) for the largest conductor entering or leaving the

enclosure. Side wire-bending space shall be in accordance with Table 312.6(A) for the largest conductor to be terminated in that space.

*Exception No. 1: Either the top or bottom wire-bending space shall be permitted to be sized in accordance with Table 312.6(A) for a panelboard rated 225 amperes or less and designed to contain not over 42 overcurrent devices. For the purposes of this exception, a 2-pole or a 3-pole circuit breaker shall be considered as two or three overcurrent devices, respectively.*

*Exception No. 2: Either the top or bottom wire-bending space for any panelboard shall be permitted to be sized in accordance with Table 312.6(A) where at least one side wire-bending space is sized in accordance with Table 312.6(B) for the largest conductor to be terminated in any side wire-bending space.*

*Exception No. 3: The top and bottom wire-bending space shall be permitted to be sized in accordance with Table 312.6(A) spacings if the panelboard is designed and constructed for wiring using only a single 90 degree bend for each conductor, including the grounded circuit conductor, and the wiring diagram shows and specifies the method of wiring that shall be used.*

*Exception No. 4: Either the top or the bottom wire-bending space, but not both, shall be permitted to be sized in accordance with Table 312.6(A) where there are no conductors terminated in that space.*

Section 408.55 covers the size of the enclosure for a panelboard. Using Exhibit 408.3 as a reference (see 312.6), the general rule calls for wire-bending spaces  $T_1$  and  $T_4$  to be in accordance with Table 312.6(B) for size  $M$  conductors (assuming these are the largest conductors entering the enclosure). Side wire-bending space  $T_2$  must be in accordance with Table 312.6(A) for the wire size to be used with the largest-rated unit facing that side space, and  $T_3$  must be similarly sized for the largest-rated unit facing the right side of the enclosure.

Exception No. 1 to 408.55 permits either  $T_1$  or  $T_4$  (not both) to be reduced to the space required by Table 312.6(A) for size  $M$  conductors for a panelboard rated 225 amperes or less and designed to contain not over 42 overcurrent devices.

Exception No. 2 to 408.55 permits either  $T_1$  or  $T_4$  (not both) to be reduced to the space required by Table 312.6(A) for size  $M$  conductors for any panelboard. Exception No. 2 is valid where either  $T_2$  or  $T_3$  (or both) is sized in accordance with Table 312.6(B) for the largest conductor to be terminated in either the left or the right side space. Under the construction rules of 408.55, a panelboard enclosure might not

be of adequate size for all manner of wiring; therefore 312.6 must be considered when wiring is planned.

Exception No. 3 to 408.55 permits both the top and the bottom wire-bending space to be reduced as noted. A single 90 degree bend, meaning one and only one 90 degree bend, must be present for the ungrounded conductors. A grounded conductor is permitted to be wired straight in if spacing is provided per Table 312.6(B) for the grounded conductor.

Exception No. 4 to 408.55 permits a reduction to the Table 312.6(A) spacing for the top or bottom space where no terminals face that space. In this case, the space is a gutter space, and measurement is on a line perpendicular to the wall of the enclosure and to the closest barrier post or side of a switch, fuse, or circuit breaker unit that is, or may be, installed. Exhibit 408.3 illustrates that exception.

**EXHIBIT 408.3** Panelboard wire-bending space per 312.6 and 408.55.

## 408.56 Minimum Spacings

The distance between bare metal parts, busbars, and so forth shall not be less than specified in Table 408.56.

Where close proximity does not cause excessive heating, parts of the same polarity at switches, enclosed fuses, and so forth shall be permitted to be placed as close together as convenience in handling will allow.

**TABLE 408.56** Minimum Spacings Between Bare Metal Parts

Voltage	Opposite Polarity Where Mounted on the Same Surface		Opposite Polarity Where Held Free in Air		Live Parts to Ground*	
	mm	in.	mm	in.	mm	in.
Not over 125 volts, nominal	19.1	¾	12.7	½	12.7	½
Not over 250 volts, nominal	31.8	1¼	19.1	¾	12.7	½
Not over 600 volts, nominal	50.8	2	25.4	1	25.4	1

\*For spacing between live parts and doors of cabinets, see 312.11(A) (1), (2), and (3).

*Exception: The distance shall be permitted to be less than that specified in Table 408.56 at circuit breakers and switches and in listed components installed in switchboards and panelboards.*

#### 408.58 Panelboard Marking

Panelboards shall be durably marked by the manufacturer with the voltage and the current rating and the number of phases for which they are designed and with the manufacturer's name or trademark in such a manner so as to be visible after installation, without disturbing the interior parts or wiring.

Panelboards to which units (circuit breakers, switches, etc.) may be added in the field are marked with the name or trademark of the manufacturer and the catalog number or equivalent of those units intended for installation in the field. Such a marking identifies the replacement or additional equipment without requiring removal of the panel cover.

## I. General

### 409.1 Scope

This article covers industrial control panels intended for general use and operating at 600 volts or less.

Informational Note: UL 508A-2001, *Standard for Industrial Control Panels*, is a safety standard for industrial control panels.

Article 409 provides installation and construction requirements for industrial control panels. These field- and factory-assembled control panels are used for the control and operation of a multitude of processes, from a sewerage pump station to an industrial process line. Similar in function to motor control centers in some regards, control panels also contain control, overcurrent protection, and power distribution equipment for operation of industrial heating processes, robotics, spray painting and powder coating lines, and countless other processes.

### 409.2 Definitions

**Control Circuit.** The circuit of a control apparatus or system that carries the electric signals directing the performance of the controller but does not carry the main power current.

**Industrial Control Panel.** An assembly of two or more components consisting of one of the following:

- (1) Power circuit components only, such as motor controllers, overload relays, fused disconnect switches, and circuit breakers

- (2) Control circuit components only, such as pushbuttons, pilot lights, selector switches, timers, switches, control relays
- (3) A combination of power and control circuit components

These components, with associated wiring and terminals, are mounted on or contained within an enclosure or mounted on a subpanel. The industrial control panel does not include the controlled equipment.

Section 409.2 provides a definition for *industrial control panel* that is compatible with industry product standards such as UL 508A, *Standard of Safety for Industrial Control Panels*.

### 409.3 Other Articles

In addition to the requirements of Article 409, industrial control panels that contain branch circuits for specific loads or components, or are for control of specific types of equipment addressed in other articles of this *Code*, shall be constructed and installed in accordance with the applicable requirements from the specific articles in Table 409.3.

**TABLE 409.3 Other Articles**

Equipment/Occupancy	Article	Section
Branch circuits	210	
Luminaires	410	
Motors, motor circuits, and controllers	430	
Air-conditioning and refrigerating equipment	440	
Capacitors		460.8, 460.9
Hazardous (classified) locations	500, 501, 502, 503, 504, 505	
Commercial garages; aircraft hangars; motor fuel dispensing facilities; bulk storage plants; spray application, dipping, and coating processes; and inhalation anesthetizing locations	511, 513, 514, 515, 516, and 517 Part IV	
Cranes and hoists	610	
Electrically driven or controlled irrigation machines	675	
Elevators, dumbwaiters, escalators, moving walks, wheelchair lifts, and stairway chair lifts	620	
Industrial machinery	670	
Resistors and reactors	470	
Transformers	450	
Class 1, Class 2, and Class 3 remote-control, signaling, and power-limited circuits	725	

## II. Installation

### 409.20 Conductor — Minimum Size and Ampacity

The size of the industrial control panel supply conductor shall have an ampacity not less than 125 percent of the full-load current rating of all resistance heating loads plus 125 percent of the full-load current rating of the highest rated motor plus the sum of the full-load current ratings of all other connected motors and apparatus based on their duty cycle that may be in operation at the same time.

### 409.21 Overcurrent Protection

**(A) General.** Industrial control panels shall be provided with overcurrent protection in accordance with Parts I, II, and IX of Article 240.

**(B) Location.** This protection shall be provided for each incoming supply circuit by either of the following:

- (1) An overcurrent protective device located ahead of the industrial control panel.
- (2) A single main overcurrent protective device located within the industrial control panel. Where overcurrent protection is provided as part of the industrial control panel, the supply conductors shall be considered as either feeders or taps as covered by 240.21.

Section 409.21(B) permits more than one incoming power supply for an industrial control panel.

**(C) Rating.** The rating or setting of the overcurrent protective device for the circuit supplying the industrial control panel shall not be greater than the sum of the largest rating or setting of the branch-circuit short-circuit and ground-fault protective device provided with the industrial control panel, plus 125 percent of the full-load current rating of all resistance heating loads, plus the sum of the full-load currents of all other motors and apparatus that could be in operation at the same time.

*Exception: Where one or more instantaneous trip circuit breakers or motor short-circuit protectors are used for motor branch-circuit short-circuit and ground-fault protection as permitted by 430.52(C), the procedure specified above for determining the maximum rating of the protective device for the circuit supplying the industrial control panel shall apply with the following provision: For the purpose of the calculation, each instantaneous trip circuit breaker or motor short-circuit protector shall be assumed to have a rating not exceeding the maximum percentage of motor full-load current permitted by Table 430.52 for the type of control panel supply circuit protective device employed.*

Where no branch-circuit short-circuit and ground-fault protective device is provided with the industrial control panel for motor or combination of motor and non-motor loads, the rating or setting of the overcurrent protective device shall be based on 430.52 and 430.53, as applicable.

#### 409.22 Short-Circuit Current Rating

An industrial control panel shall not be installed where the available fault current exceeds its short-circuit current rating as marked in accordance with 409.110(4).

Section 409.110 includes requirements for short-circuit current rating markings on industrial control panels. It points out that the short-circuit rating of a listed and labeled assembly can be used to determine suitability of the equipment or some other method can be used to determine suitability.

#### 409.30 Disconnecting Means

Disconnecting means that supply motor loads shall comply with Part IX of Article 430.

#### 409.60 Grounding

Multisection industrial control panels shall be bonded together with an equipment grounding conductor or an equivalent equipment grounding bus sized in accordance with Table 250.122. Equipment grounding conductors shall be connected to this equipment grounding bus or to an equipment grounding termination point provided in a single-section industrial control panel.

### III. Construction Specifications

In addition to the field supply wiring requirements for all control panels contained in Part II, construction requirements for control panels are covered in Part III of Article 409. The *Code* does not require that control panels be listed, and Part III provides the authority having jurisdiction with a set of requirements that can be used as a benchmark for approval of a field-constructed control panel.

#### 409.100 Enclosures

Table 110.28 shall be used as the basis for selecting industrial control panel enclosures for use in specific locations other than hazardous (classified) locations. The enclosures are not intended to protect against conditions such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings.

#### 409.102 Busbars and Conductors

Industrial control panels utilizing busbars shall comply with 409.102(A) and (B).

**(A) Support and Arrangement.** Busbars shall be protected from physical damage and be held firmly in place.

**(B) Phase Arrangement.** The phase arrangement on 3-phase horizontal common power and vertical buses shall be A, B, C from front to back, top to bottom, or left to right, as viewed from the front of the industrial control panel. The B phase shall be that phase having the higher voltage to ground on 3-phase, 4-wire, delta-connected systems. Other busbar arrangements shall be permitted for additions to existing installations, and the phases shall be permanently marked.

#### 409.104 Wiring Space

**(A) General.** Industrial control panel enclosures shall not be used as junction boxes, auxiliary gutters, or raceways for conductors feeding through or tapping off to other switches or overcurrent devices or other equipment, unless the conductors fill less than 40 percent of the cross-sectional area of the wiring space. In addition, the conductors, splices, and taps shall not fill the wiring space at any cross section to more than 75 percent of the cross-sectional area of that space.

**(B) Wire Bending Space.** Wire bending space within industrial control panels for field wiring terminals shall be in accordance with the requirements in 430.10(B).

#### 409.106 Spacings

Spacings in feeder circuits between uninsulated live parts of adjacent components, between uninsulated live parts of components and grounded or accessible non-current-carrying metal parts, between uninsulated live parts of components and the enclosure, and at field wiring terminals shall be as shown in Table 430.97.

This section was revised for the 2011 *Code* to provide clarification as to where spacing is required in industrial control panels.

*Exception: Spacings shall be permitted to be less than those specified in Table 430.97 at circuit breakers and switches and in listed components installed in industrial control panels.*

#### 409.108 Service Equipment

Where used as service equipment, each industrial control panel shall be of the type that is suitable for use as service equipment.

Where a grounded conductor is provided, the industrial control panel shall be provided with a main bonding jumper, sized in accordance with 250.28(D), for connecting the

grounded conductor, on its supply side, to the industrial control panel equipment ground bus or equipment ground terminal.

### 409.110 Marking

An industrial control panel shall be marked with the following information that is plainly visible after installation:

- (1) Manufacturer's name, trademark, or other descriptive marking by which the organization responsible for the product can be identified.
- (2) Supply voltage, number of phases, frequency, and full-load current for each incoming supply circuit.
- (3) Industrial control panels supplied by more than one power source such that more than one disconnecting means is required to disconnect all power within the control panel shall be marked to indicate that more than one disconnecting means is required to de-energize the equipment.

This section is new in the 2011 *Code*. The person servicing the industrial control panel may not realize there is more than one power supply to the industrial control panel. With this required labeling, the personnel servicing the equipment will be better protected from shock hazards or possible electrocution. This requirement is similar to the requirement in Section 55.4 of UL 508A, which is the standard for listed industrial control panels.

- (4) Short-circuit current rating of the industrial control panel based on one of the following:
  - a. Short-circuit current rating of a listed and labeled assembly
  - b. Short-circuit current rating established utilizing an approved method

Informational Note: UL 508A-2001, *Standard for Industrial Control Panels*, Supplement SB, is an example of an approved method.

*Exception to (4): Short-circuit current rating markings are not required for industrial control panels containing only control circuit components.*

Like other types of electrical distribution and control equipment, one of the primary concerns associated with a group of components assembled in a common enclosure for the purposes of operation, control, and overcurrent protection is the ability of this equipment to limit and contain the effects of an internal fault such as a short circuit or ground fault in such a manner that at the very least the internal fault does not pose an external ignition threat.

Section 409.110(4) requires markings on industrial control panels that contain power circuit components indicating their short-circuit current rating. Industrial control panels containing only control circuit components do not require the short-circuit current marking.

In many control panel installations, the available fault energy at the line terminals of components within the control panel is significant, and the absence of a short-circuit current rating and compliance therewith is a recipe for the possibility of a failure that extends beyond the control panel enclosure. Not only are high levels of short-circuit current available at the line terminals of many industrial control panels, there is also an interaction of the protective and control components under fault conditions that is assessed as part of the evaluation of control panels by conformity-testing organizations. Assembling interrelated and interactive control and protective components in an enclosure presents a dynamic that in many cases can be evaluated for safety only under strict conformity assessment guidelines. The determination of the panel's short-circuit current rating should not be confused with the calculation of available short-circuit current at the terminals of the panel. The former is determined to see what current the panel can withstand, and the latter is used to make sure that the available short-circuit current is less than the panel's short-circuit current rating.

- (5) If the industrial control panel is intended as service equipment, it shall be marked to identify it as being suitable for use as service equipment.
- (6) Electrical wiring diagram or the identification number of a separate electrical wiring diagram or a designation referenced in a separate wiring diagram.
- (7) An enclosure type number shall be marked on the industrial control panel enclosure.

## I. General

### 410.1 Scope

This article covers luminaires, portable luminaires, lampholders, pendants, incandescent filament lamps, arc lamps, electric-discharge lamps, decorative lighting products, lighting accessories for temporary seasonal and holiday use, portable flexible lighting products, and the wiring and equipment forming part of such products and lighting installations.

### 410.2 Definitions

**Closet Storage Space.** The volume bounded by the sides and back closet walls and planes extending from the closet floor vertically to a height of 1.8 m (6 ft) or to the highest clothes-hanging rod and parallel to the walls at a horizontal distance of 600 mm (24 in.) from the sides and back of the closet walls, respectively, and continuing vertically to the closet ceiling parallel to the walls at a horizontal distance of 300 mm (12 in.) or the width of the shelf, whichever is greater; for a closet that permits access to both sides of a hanging rod, this space includes the volume below the highest rod extending 300 mm (12 in.) on either side of the rod on a plane horizontal to the floor extending the entire length of the rod. See Figure 410.2.

The 24-in. dimension in the definition of *closet storage space* is intended to cover the clothes-hanging space, even if no clothes-hanging rod is installed. If such a rod is installed, the space extends from the floor to the top of the highest rod.

FIGURE 410.2 Closet Storage Space.

If no clothes-hanging rod is installed, the space extends from the floor to a height of 6 ft.

In addition to the space in which clothing is hung from the closet pole or rod, this definition also establishes a 12-in.-wide shelf space to cover those installations where shelving is not in place at the time of fixture installation. If shelving is installed and the shelves are wider than 12 in., the greater width must be applied in establishing this space.

The storage space for closets that permit access to both sides of the clothes-hanging rod is based on a horizontal plane extending 12 in. from both sides of the rod, from the rod down to the floor. This equates to the 24-in. space required for the closet rod where there is only one direction of access.

**Lighting Track.** A manufactured assembly designed to support and energize luminaires that are capable of being readily repositioned on the track. Its length can be altered by the addition or subtraction of sections of track.

#### 410.5 Live Parts

Luminaires, portable luminaires, lampholders, and lamps shall have no live parts normally exposed to contact. Exposed accessible terminals in lampholders and switches shall not be installed in metal luminaire canopies or in open bases of portable table or floor luminaires.

*Exception:* Cleat-type lampholders located at least 2.5 m (8 ft) above the floor shall be permitted to have exposed terminals.

#### 410.6 Listing Required

All luminaires and lampholders shall be listed.

#### 410.8 Inspection

Luminaires shall be installed such that the connections between the luminaire conductors and the circuit conductors can be inspected without requiring the disconnection of any part of the wiring unless the luminaires are connected by attachment plugs and receptacles.

## II. Luminaire Locations

### 410.10 Luminaires in Specific Locations

An Underwriters Laboratories Inc. pamphlet entitled *Luminaires Marking Guide*, 8th Edition, 2009, provides information on markings to help the authority having jurisdiction quickly determine whether common types of UL-listed fluorescent, high-intensity discharge, and incandescent fixtures are suitable for the location and are installed correctly.

**(A) Wet and Damp Locations.** Luminaires installed in wet or damp locations shall be installed such that water cannot enter or accumulate in wiring compartments, lampholders, or other electrical parts. All luminaires installed in wet locations shall be marked, "Suitable for Wet Locations." All luminaires installed in damp locations shall be marked "Suitable for Wet Locations" or "Suitable for Damp Locations."

Where luminaires are exposed to the weather or subject to water saturation, 410.10(A) requires they be of a type marked "Suitable for Wet Locations." Correct design, construction, and installation of these luminaires will prevent the entrance of rain, snow, ice, and dust. Outdoor parks and parking lots, outdoor recreational areas (tennis, golf, baseball, etc.), car wash areas, and building exteriors are examples of wet locations.

Luminaires in locations protected from the weather and not subject to water saturation but still exposed to moisture, must be marked "Suitable for Damp Locations" or "Suitable for Wet Locations." The following are examples of damp locations:

1. The underside of store or gasoline station canopies or theater marquees
2. Some cold-storage warehouses
3. Some agricultural buildings
4. Some basements
5. Roofed open porches and carports

See the definitions of *location, damp; location, dry; and location, wet* in Article 100.

**(B) Corrosive Locations.** Luminaires installed in corrosive locations shall be of a type suitable for such locations.

**(C) In Ducts or Hoods.** Luminaires shall be permitted to be installed in commercial cooking hoods where all of the following conditions are met:

- (1) The luminaire shall be identified for use within commercial cooking hoods and installed such that the temperature limits of the materials used are not exceeded.
- (2) The luminaire shall be constructed so that all exhaust vapors, grease, oil, or cooking vapors are excluded from the lamp and wiring compartment. Diffusers shall be resistant to thermal shock.
- (3) Parts of the luminaire exposed within the hood shall be corrosion resistant or protected against corrosion, and the surface shall be smooth so as not to collect deposits and to facilitate cleaning.
- (4) Wiring methods and materials supplying the luminaire(s) shall not be exposed within the cooking hood.

Informational Note: See 110.11 for conductors and equipment exposed to deteriorating agents.

The requirement in 410.10(C)(4) was initially taken from NFPA 96, *Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations*. NFPA 96 provides the minimum fire safety requirements (preventive and operative) related to the design, installation, operation, inspection, and maintenance of all public and private cooking operations, except in single-family residential dwellings.

NFPA 96 covers residential cooking equipment where used for purposes other than residential family use — such as employee kitchens or break areas and church and meeting hall kitchens — regardless of frequency of use.

Grease may cause the deterioration of conductor insulation, resulting in short circuits or ground faults in wiring, hence the requirement prohibiting wiring methods and materials (raceways, cables, lampholders) within ducts or hoods. Conventional enclosed and gasketed-type luminaires located in the path of travel of exhaust products are not permitted because a fire could result from the high temperatures on grease-coated glass bowls or globes enclosing the lamps. Recessed or surface gasketed-type luminaires intended for location within hoods must be identified as suitable for the specific purpose and should be installed with the required clearances maintained. Note that wiring systems, including rigid metal conduit, are not permitted to be run exposed within the cooking hood.

For further information, refer to UL 710, *Standard for Safety for Exhaust Hoods for Commercial Cooking Equipment*.

**(D) Bathtub and Shower Areas.** No parts of cord-connected luminaires, chain-, cable-, or cord-suspended luminaires, lighting track, pendants, or ceiling-suspended (paddle) fans shall be located within a zone measured 900 mm (3 ft) horizontally and 2.5 m (8 ft) vertically from the top of the bathtub rim or shower stall threshold. This zone is all encompassing and includes the space directly over the tub or shower stall. Luminaires located within the actual outside dimension of the bathtub or shower to a height of 2.5 m (8 ft) vertically from the top of the bathtub rim or shower threshold shall be marked for damp locations, or marked for wet locations where subject to shower spray.

The last sentence of 410.10(D) clarifies that securely fastened luminaires installed in or on the ceiling or wall are permitted to be located in the bathtub or shower area. Where they are subject to shower spray, the luminaires must be listed for a wet location. Luminaires installed in the tub or shower zone and not subject to shower spray are required to be listed for use in a damp location. GFCI protection is required only where specified in the installation instructions for the luminaire.

The intent of 410.10(D) is to keep cord-connected, chain-hanging, or pendant luminaires and suspended fans out of the reach of an individual standing on a bathtub rim. The list of prohibited items recognizes that the same risk of electric shock is present for each one.

Exhibit 410.1 illustrates the restricted zone in which the

**EXHIBIT 410.1** Luminaires, lighting track, and suspended (paddle) fan located near a bathtub.

specified luminaires, lighting track, and paddle fans are prohibited. This requirement applies to hydromassage bathtubs, as defined in 680.2, as well as other bathtub types and shower areas. See 680.43 for installation requirements for spas and hot tubs (as defined in 680.2) installed indoors.

**(E) Luminaires in Indoor Sports, Mixed-Use, and All-Purpose Facilities.** Luminaires subject to physical damage, using a mercury vapor or metal halide lamp, installed in playing and spectator seating areas of indoor sports, mixed-use, or all-purpose facilities shall be of the type that protects the lamp with a glass or plastic lens. Such luminaires shall be permitted to have an additional guard.

Instances of accidental breakage of mercury or metal halide lamp outer jackets in open luminaires have occurred in sports facilities and other similar locations. If the lamp is damaged, glass shards can fall on players or spectators. If the envelope is damaged, the arc tube continues to operate even though the outer jacket may be cracked or missing. This section requires luminaires to have their lamps protected by a glass or plastic lens, and it also permits an additional protective guard over the lens cover.

#### 410.11 Luminaires Near Combustible Material

Luminaires shall be constructed, installed, or equipped with shades or guards so that combustible material is not subjected to temperatures in excess of 90°C (194°F).

The requirements of 410.11, 410.12, 410.14, and 410.16 regulate the placement of luminaires near combustible materials so that they do not become a heat source that could ignite the fuel source. Tests have shown that hot particles from broken incandescent lamps can ignite combustibles below the lamps.

#### 410.12 Luminaires over Combustible Material

Lampholders installed over highly combustible material shall be of the unswitched type. Unless an individual switch is provided for each luminaire, lampholders shall be located at least 2.5 m (8 ft) above the floor or shall be located or guarded so that the lamps cannot be readily removed or damaged.

Section 410.12 refers to pendants and fixed lighting equipment installed above highly combustible material. If a lamp cannot be located out of reach, the requirement can be met by equipping the lamp with a suitable guard. Section 410.12 does not apply to portable lamps.

#### 410.14 Luminaires in Show Windows

Chain-supported luminaires used in a show window shall be permitted to be externally wired. No other externally wired luminaires shall be used.

#### 410.16 Luminaires in Clothes Closets

**(A) Luminaire Types Permitted.** Only luminaires of the following types shall be permitted in a closet:

- (1) Surface-mounted or recessed incandescent or LED luminaires with completely enclosed light sources
- (2) Surface-mounted or recessed fluorescent luminaires
- (3) Surface-mounted fluorescent or LED luminaires identified as suitable for installation within the closet storage space

According to 410.16(A)(3), LED lighting, a new technology with a very low heat source, is permitted in clothes closets if listed for closet use.

**(B) Luminaire Types Not Permitted.** Incandescent luminaires with open or partially enclosed lamps and pendant luminaires or lampholders shall not be permitted.

See the commentary following 410.16(C)(3).

**(C) Location.** The minimum clearance between luminaires installed in clothes closets and the nearest point of a closet storage space shall be as follows:

- (1) 300 mm (12 in.) for surface-mounted incandescent or LED luminaires with a completely enclosed light source installed on the wall above the door or on the ceiling.
- (2) 150 mm (6 in.) for surface-mounted fluorescent luminaires installed on the wall above the door or on the ceiling.
- (3) 150 mm (6 in.) for recessed incandescent or LED luminaires with a completely enclosed light source installed in the wall or the ceiling.

The requirement of 410.16(C)(3) results from tests that have shown that a hot filament falling from a broken incandescent lamp can ignite combustible material below the luminaire in which the lamp is installed.

- (4) 150 mm (6 in.) for recessed fluorescent luminaires installed in the wall or the ceiling.
- (5) Surface-mounted fluorescent or LED luminaires shall be permitted to be installed within the closet storage space where identified for this use.

The requirements of 410.16(C) apply to incandescent, fluorescent, and LED lighting in the storage spaces of clothes closets in various kinds of occupancies. The requirements are intended to prevent hot lamps or parts of broken lamps from coming in contact with boxes, cartons, blankets, and the like, stored on shelves and with clothing hung in closets. The clearance measurement for each requirement in 410.16(C) is to the luminaire, not to the lamp itself.

A luminaire in a clothes closet is not mandatory; if one is installed, however, the conditions for installation are as required by 410.16(C).

### 410.18 Space for Cove Lighting

Coves shall have adequate space and shall be located so that lamps and equipment can be properly installed and maintained.

Adequate space is necessary to allow easy access for relamping luminaires or replacing lampholders, ballasts, and so on. Adequate space also improves ventilation.

## III. Provisions at Luminaire Outlet Boxes, Canopies, and Pans

### 410.20 Space for Conductors

Canopies and outlet boxes taken together shall provide sufficient space so that luminaire conductors and their connecting devices are capable of being installed in accordance with 314.16.

This section was revised for the 2011 *Code*. UL 1598, *Standard for Safety for Luminaires*, allows junction boxes and splice compartments that are integral to luminaires to have reduced free volume in respect to the requirements of 314.16. The reason is that 314.16 applies to general purpose boxes and conduit bodies where installed conductors and devices are variable, while the conductors and devices that will be contained within a luminaire junction box are known.

### 410.21 Temperature Limit of Conductors in Outlet Boxes

Luminaires shall be of such construction or installed so that the conductors in outlet boxes shall not be subjected to temperatures greater than that for which the conductors are rated.

Branch-circuit wiring, other than 2-wire or multiwire branch circuits supplying power to luminaires connected together, shall not be passed through an outlet box that is an

integral part of a luminaire unless the luminaire is identified for through-wiring.

Informational Note: See 410.64(C) for wiring supplying power to luminaires connected together.

Branch-circuit conductors run to a lighting outlet box are not permitted to be subjected to temperatures higher than those for which they are rated. Take, for example, conductors that are rated 75°C and that are to supply a ceiling outlet box for the connection of a surface-mounted luminaire or attached outlet box of a recessed luminaire. The design and installation of the luminaire should be such that the heat of the lamps does not subject the conductors to a greater temperature than 75°C. Recessed luminaires are listed by Underwriters Laboratories Inc. based on the heat-contributing factor of the supply conductors of not more than the maximum permitted lamp wattage of the luminaire.

Exhibit 410.2 illustrates recessed luminaires listed by Underwriters Laboratories Inc. for one set of supply conductors, and Exhibit 410.3 illustrates luminaires listed for a feed-through installation.

**EXHIBIT 410.2** Recessed luminaires designed for branch-circuit conductors terminating at each luminaire (no feed-through), per 410.21.

### 410.22 Outlet Boxes to Be Covered

In a completed installation, each outlet box shall be provided with a cover unless covered by means of a luminaire canopy, lampholder, receptacle, or similar device.

### 410.23 Covering of Combustible Material at Outlet Boxes

Any combustible wall or ceiling finish exposed between the edge of a luminaire canopy or pan and an outlet box shall be covered with noncombustible material.

**EXHIBIT 410.3** Recessed luminaires designed for feed-through branch-circuit conductors.

Luminaires must be designed and installed not only to prevent overheating of conductors but also to prevent overheating of adjacent combustible wall or ceiling finishes. Hence, it is required that any combustible finish between the edge of a luminaire canopy and an outlet box be covered with a non-combustible material or luminaire accessory. See 314.20 for the requirements covering combustible finishes. Where luminaires are not directly mounted on outlet boxes, suitable outlet box covers are required.

#### 410.24 Connection of Electric-Discharge and LED Luminaires

**(A) Independent of the Outlet Box.** Electric-discharge and LED luminaires supported independently of the outlet box shall be connected to the branch circuit through metal raceway, nonmetallic raceway, Type MC cable, Type AC cable, Type MI cable, nonmetallic sheathed cable, or by flexible cord as permitted in 410.62(B) or 410.62(C).

**(B) Access to Boxes.** Electric-discharge and LED luminaires surface mounted over concealed outlet, pull, or junction boxes and designed not to be supported solely by the outlet box shall be provided with suitable openings in the back of the luminaire to provide access to the wiring in the box.

### IV. Luminaire Supports

#### 410.30 Supports

**(A) General.** Luminaires and lampholders shall be securely supported. A luminaire that weighs more than 3 kg (6 lb) or exceeds 400 mm (16 in.) in any dimension shall not be supported by the screw shell of a lampholder.

**(B) Metal or Nonmetallic Poles Supporting Luminaires.** Metal or nonmetallic poles shall be permitted to be used to support luminaires and as a raceway to enclose supply conductors, provided the following conditions are met:

- (1) A pole shall have a handhole not less than 50 mm × 100 mm (2 in. × 4 in.) with a cover suitable for use in wet locations to provide access to the supply terminations within the pole or pole base.

*Exception No. 1: No handhole shall be required in a pole 2.5 m (8 ft) or less in height abovegrade where the supply wiring method continues without splice or pull point, and where the interior of the pole and any splices are accessible by removing the luminaire.*

Exception No. 1 to 410.30(B)(1) typically applies to both landscape (bollard-type) lighting and pole lights at residential dwellings.

*Exception No. 2: No handhole shall be required in a pole 6.0 m (20 ft) or less in height abovegrade that is provided with a hinged base.*

Exception No. 2 to 410.30(B)(1) recognizes metal light poles that do not have a handhole but instead use a hinged-base pole to permit access to splices made in the pole base. The height of the pole is limited to 20 ft. The pole and the base must be bonded in accordance with 250.96 (systems operating at 250 volts or less) or 250.97 (circuits operating at over 250 volts), depending on the voltage of the system.

Exhibit 410.4 illustrates a metal light pole with a hinged baseplate that meets the requirements of Exception No. 2 to 410.30(B)(1). A handhole is not necessary because the pole can be tilted to allow access to terminations in the base.

- (2) Where raceway risers or cable is not installed within the pole, a threaded fitting or nipple shall be brazed, welded, or attached to the pole opposite the handhole for the supply connection.
- (3) A metal pole shall be provided with an equipment grounding terminal as follows:
  - a. A pole with a handhole shall have the equipment grounding terminal accessible from the handhole.
  - b. A pole with a hinged base shall have the equipment grounding terminal accessible within the base.

*Exception to (3): No grounding terminal shall be required in a pole 2.5 m (8 ft) or less in height abovegrade where the supply wiring method continues without splice or pull, and where the interior of the pole and any splices are accessible by removing the luminaire.*

**EXHIBIT 410.4** A hinged-base metal pole supporting a luminaire.

- (4) A metal pole with a hinged base shall have the hinged base and pole bonded together.
- (5) Metal raceways or other equipment grounding conductors shall be bonded to the metal pole with an equipment grounding conductor recognized by 250.118 and sized in accordance with 250.122.
- (6) Conductors in vertical poles used as raceway shall be supported as provided in 300.19.

In 410.30(B) metal poles are permitted to be used as raceways and individual single conductors can be installed to supply the luminaire supported by the pole. Where individual single conductors are installed in a luminaire pole, separation between the power wiring and any communications, signaling, and power-limited circuits that are also installed within the pole is required. See 725.139, 800.133(A)(1)(d), or 820.133(A)(1)(c), as appropriate.

For example, where a light pole supports a luminaire and a security camera, the security camera signaling and power-limited wiring may be installed within the pole cavity if kept separated. Because the pole contains open circuit conductors (e.g., THW or XHHW conductors) that supply the luminaire, the separation requirement can be fulfilled by

enclosing the camera conductors within a flexible raceway and installing that raceway within the pole. The use of a cable or cord assembly for the lighting circuit conductors is also an option. Section 410.30(B)(6) requires that conductors installed within poles be supported the same as in a vertical raceway in accordance with 300.19.

Section 410.30(B) is not intended to necessarily require the placement of a raceway for communications cables on the exterior of a lighting pole.

### 410.36 Means of Support

**(A) Outlet Boxes.** Outlet boxes or fittings installed as required by 314.23 and complying with the provisions of 314.27(A)(1) and 314.27(A)(A)(2) shall be permitted to support luminaires.

Regardless of whether a luminaire is attached to an outlet box or is supported independently of the outlet box, care should be taken to securely fasten the outlet box or support the independent rod or hanger to ensure that the luminaire is securely mounted in place. The luminaire may be securely mounted to the box; however, if the box is not secured, it becomes the weak link in the luminaire support.

**(B) Suspended Ceilings.** Framing members of suspended ceiling systems used to support luminaires shall be securely fastened to each other and shall be securely attached to the building structure at appropriate intervals. Luminaires shall be securely fastened to the ceiling framing member by mechanical means such as bolts, screws, or rivets. Listed clips identified for use with the type of ceiling framing member(s) and luminaire(s) shall also be permitted.

Section 410.36(B) provides requirements for luminaire installations where the luminaire is supported by a suspended, or hung, ceiling. Where a luminaire is supported independent of a suspended ceiling, 410.36(B) does not apply.

Section 410.36(B) requires that if clips are used to support a luminaire to the framing members of a suspended ceiling, those clips must be of a type listed for the application. However, the use of listed clips for luminaire support does not complete the requirements of this section. Additionally, the ceiling framing members must be securely attached to each other and to the building structure. These requirements apply to all luminaires supported by a suspended ceiling assembly, including lay-in and surface-mounted types.

For the support of wiring that is located in the cavity of floor-ceiling assemblies, see 300.11(A).

**(C) Luminaire Studs.** Luminaire studs that are not a part of outlet boxes, hickey, tripods, and crowfeet shall be made of steel, malleable iron, or other material suitable for the application.

**(D) Insulating Joints.** Insulating joints that are not designed to be mounted with screws or bolts shall have an exterior metal casing, insulated from both screw connections.

**(E) Raceway Fittings.** Raceway fittings used to support a luminaire(s) shall be capable of supporting the weight of the complete fixture assembly and lamp(s).

**(F) Busways.** Luminaires shall be permitted to be connected to busways in accordance with 368.17(C).

**(G) Trees.** Outdoor luminaires and associated equipment shall be permitted to be supported by trees.

Informational Note No. 1: See 225.26 for restrictions for support of overhead conductors.

The support of overhead conductor spans on trees is prohibited by 225.26.

Informational Note No. 2: See 300.5(D) for protection of conductors.

Section 300.5(D) requires buried conductors and cables to be protected from physical damage by the use of raceways from a specified point below grade to a point at least 8 ft above finish grade.

## V. Grounding

### 410.40 General

Luminaires and lighting equipment shall be grounded as required in Article 250 and Part V of this article.

### 410.42 Luminaire(s) with Exposed Conductive Parts

Exposed metal parts shall be connected to an equipment grounding conductor or insulated from the equipment grounding conductor and other conducting surfaces or be inaccessible to unqualified personnel. Lamp tie wires, mounting screws, clips, and decorative bands on glass spaced at least 38 mm (1½ in.) from lamp terminals shall not be required to be grounded.

### 410.44 Methods of Grounding

Luminaires and equipment shall be mechanically connected to an equipment grounding conductor as specified in 250.118 and sized in accordance with 250.122.

*Exception No. 1: Luminaires made of insulating material that is directly wired or attached to outlets supplied by a wiring method that does not provide a ready means for grounding attachment to an equipment grounding conductor shall be made of insulating material and shall have no exposed conductive parts.*

*Exception No. 2: Replacement luminaires shall be permitted to connect an equipment grounding conductor from the outlet in compliance with 250.130(C). The luminaire shall then comply with 410.42.*

The rules for grounding of luminaires were reorganized in the 2011 Code. The requirement formerly in 410.46 was relocated to become the main rule in 410.44. The former 410.42(B) became Exception No. 2 to 410.44. Exception No. 2 provides a method by which a luminaire with exposed conductive parts can be installed at an outlet where the wiring method is not an equipment grounding conductor per 250.118 or does not provide an equipment grounding conductor. In older installations where luminaires are replaced, the requirement to ground exposed metal parts of the luminaire is not negated simply because no means of grounding is provided by the existing wiring system. The means allowed by the exception is the same as is permitted for receptacles installed at outlets where no grounding means exists. A single grounding conductor can be run independently of the circuit conductors, from the outlet to a point on the wiring system where an effective grounding connection can be made. The acceptable termination points for this separate grounding conductor are specified by 250.130(C).

*Exception No. 3: Where no equipment grounding conductor exists at the outlet, replacement luminaires that are GFCI protected shall not be required to be connected to an equipment grounding conductor.*

Exception No. 3 to 410.44(B) permits a GFCI to provide protection for personnel where luminaires are supplied by a circuit that does not have an equipment grounding conductor. This exception provides added protection similar to that provided for receptacles supplied from older circuits without an equipment grounding conductor. However, it does not allow the installation of a new circuit without an equipment grounding conductor to supply luminaires.

### 410.46 Equipment Grounding Conductor Attachment

Luminaires with exposed metal parts shall be provided with a means for connecting an equipment grounding conductor for such luminaires.

## VI. Wiring of Luminaires

### 410.48 Luminaire Wiring — General

Wiring on or within luminaires shall be neatly arranged and shall not be exposed to physical damage. Excess wiring shall be avoided. Conductors shall be arranged so that they are not subjected to temperatures above those for which they are rated.

### 410.50 Polarization of Luminaires

Luminaires shall be wired so that the screw shells of lampholders are connected to the same luminaire or circuit conductor or terminal. The grounded conductor, where connected to a screw shell lampholder, shall be connected to the screw shell.

### 410.52 Conductor Insulation

Luminaires shall be wired with conductors having insulation suitable for the environmental conditions, current, voltage, and temperature to which the conductors will be subjected.

Informational Note: For ampacity of fixture wire, maximum operating temperature, voltage limitations, minimum wire size, and so forth, see Article 402.

### 410.54 Pendant Conductors for Incandescent Filament Lamps

**(A) Support.** Pendant lampholders with permanently attached leads, where used for other than festoon wiring, shall be hung from separate stranded rubber-covered conductors that are soldered directly to the circuit conductors but supported independently thereof.

**(B) Size.** Unless part of listed decorative lighting assemblies, pendant conductors shall not be smaller than 14 AWG for mogul-base or medium-base screw shell lampholders or smaller than 18 AWG for intermediate or candelabra-base lampholders.

**(C) Twisted or Cabled.** Pendant conductors longer than 900 mm (3 ft) shall be twisted together where not cabled in a listed assembly.

### 410.56 Protection of Conductors and Insulation

**(A) Properly Secured.** Conductors shall be secured in a manner that does not tend to cut or abrade the insulation.

**(B) Protection Through Metal.** Conductor insulation shall be protected from abrasion where it passes through metal.

**(C) Luminaire Stems.** Splices and taps shall not be located within luminaire arms or stems.

**(D) Splices and Taps.** No unnecessary splices or taps shall be made within or on a luminaire.

Informational Note: For approved means of making connections, see 110.14.

**(E) Stranding.** Stranded conductors shall be used for wiring on luminaire chains and on other movable or flexible parts.

**(F) Tension.** Conductors shall be arranged so that the weight of the luminaire or movable parts does not put tension on the conductors.

### 410.59 Cord-Connected Showcases

Individual showcases, other than fixed, shall be permitted to be connected by flexible cord to permanently installed receptacles, and groups of not more than six such showcases shall be permitted to be coupled together by flexible cord and separable locking-type connectors with one of the group connected by flexible cord to a permanently installed receptacle.

The installation shall comply with 410.59(A) through (E).

**(A) Cord Requirements.** Flexible cord shall be of the hard-service type, having conductors not smaller than the branch-circuit conductors, having ampacity at least equal to the branch-circuit overcurrent device, and having an equipment grounding conductor.

Informational Note: See Table 250.122 for size of equipment grounding conductor.

**(B) Receptacles, Connectors, and Attachment Plugs.** Receptacles, connectors, and attachment plugs shall be of a listed grounding type rated 15 or 20 amperes.

**(C) Support.** Flexible cords shall be secured to the undersides of showcases such that all of the following conditions are ensured:

- (1) The wiring is not exposed to physical damage.
- (2) The separation between cases is not in excess of 50 mm (2 in.), or more than 300 mm (12 in.) between the first case and the supply receptacle.
- (3) The free lead at the end of a group of showcases has a female fitting not extending beyond the case.

**(D) No Other Equipment.** Equipment other than showcases shall not be electrically connected to showcases.

**(E) Secondary Circuit(s).** Where showcases are cord-connected, the secondary circuit(s) of each electric-discharge lighting ballast shall be limited to one showcase.

### 410.62 Cord-Connected Lampholders and Luminaires

**(A) Lampholders.** Where a metal lampholder is attached to a flexible cord, the inlet shall be equipped with an insulating bushing that, if threaded, is not smaller than metric designator 12 (trade size  $\frac{3}{8}$ ) pipe size. The cord hole shall be of a size appropriate for the cord, and all burrs and fins shall be removed in order to provide a smooth bearing surface for the cord.

Bushing having holes 7 mm ( $\frac{9}{32}$  in.) in diameter shall be permitted for use with plain pendant cord and holes 11 mm ( $\frac{13}{32}$  in.) in diameter with reinforced cord.

Metal lampholders (brass- and aluminum-shell type) used with flexible-cord pendants are required to be equipped with smooth and permanently secured insulating bushings. Non-metallic-type lampholders do not require a bushing, because the material and design afford equivalent protection.

**(B) Adjustable Luminaires.** Luminaires that require adjusting or aiming after installation shall not be required to be equipped with an attachment plug or cord connector, provided the exposed cord is of the hard-usage or extra-hard-usage type and is not longer than that required for maximum adjustment. The cord shall not be subject to strain or physical damage.

### (C) Electric-Discharge and LED Luminaires.

**(1) Cord-Connected Installation.** A luminaire or a listed assembly shall be permitted to be cord connected if the following conditions apply:

- (1) The luminaire is located directly below the outlet or busway.
- (2) The flexible cord meets all the following:
  - a. Is visible for its entire length outside the luminaire
  - b. Is not subject to strain or physical damage
  - c. Is terminated in a grounding-type attachment plug cap or busway plug, or is a part of a listed assembly incorporating a manufactured wiring system connector in accordance with 604.6(C), or has a luminaire assembly with a strain relief and canopy having a maximum 152 mm (6 in.) long section of raceway for attachment to an outlet box above a suspended ceiling

Section 410.62(C)(1) applies to listed cord-and-plug-connected electric-discharge luminaires, such as the luminaire illustrated in Exhibit 410.5, and electric-discharge luminaire assemblies. The supply cord is not permitted to

**EXHIBIT 410.5** A listed cord-and-plug-connected electric-discharge luminaire, per 410.62(C)(1).

penetrate a suspended ceiling, because the cord is required to be continuously visible along its entire length.

Section 410.62(C)(1)(2)c permits a listed manufactured wiring system connector that is part of a fabricated assembly to supply electric-discharge luminaires in place of a grounding-type attachment plug. The last phrase of this paragraph permits certain listed assemblies with a 6 in. maximum section of raceway to be installed above a suspended ceiling.

Supply cords cannot be used as a supporting means, and the luminaires must be suspended directly below the outlet boxes supplying each luminaire. Electric-discharge luminaires are not permitted to be supplied by cord if they are installed in lift-out-type suspended ceilings. If the electric-discharge luminaire is suspended below the lift-out-type ceiling, the cord is not permitted to penetrate the ceiling, unless it is part of a listed luminaire assembly as described in 410.62(C)(1)(2)c. Section 400.8 further explains the uses not permitted for cords. According to 368.17(C), Exceptions No. 2 and No. 3, electric-discharge luminaires are permitted to be connected to busways by cords plugged directly into the busway or suspended from the busway.

**(2) Provided with Mogul-Base, Screw Shell Lampholders.** Electric-discharge luminaires provided with mogul-base, screw shell lampholders shall be permitted to be connected to branch circuits of 50 amperes or less by cords complying with 240.5. Receptacles and attachment plugs shall be permitted to be of a lower ampere rating than the branch circuit but not less than 125 percent of the luminaire full-load current.

**(3) Equipped with Flanged Surface Inlet.** Electric-discharge luminaires equipped with a flanged surface inlet

shall be permitted to be supplied by cord pendants equipped with cord connectors. Inlets and connectors shall be permitted to be of a lower ampere rating than the branch circuit but not less than 125 percent of the luminaire load current.

#### 410.64 Luminaires as Raceways

Luminaires shall not be used as a raceway for circuit conductors unless they comply with 410.64(A), (B), or (C).

This section was rewritten for the 2011 *Code* to improve usability. It combines the requirements that were formerly in 410.65 with those of 410.64. Additionally, a reference to 410.21 was added for clarity. Section 410.64 does not permit luminaires to be used as raceways for circuit conductors unless specifically listed and marked for this use. According to the UL *Luminaire Marking Guide*, 8th Edition, 2009, luminaires listed for use as raceways are marked “Suitable for Use as a Raceway” and also “Maximum of \_\_\_\_\_°C permitted in raceway.” Without these markings, a row of luminaires connected end to end cannot be used as a raceway for circuit conductors other than the 2-wire or multiwire circuit supplying the luminaires. Luminaires identified for use as a raceway have been evaluated for the heat contribution caused by additional current-carrying conductors.

**(A) Listed.** Luminaires listed and marked for use as a raceway shall be permitted to be used as a raceway.

**(B) Through-Wiring.** Luminaires identified for through-wiring, as permitted by 410.21, shall be permitted to be used as a raceway.

**(C) Luminaires Connected Together.** Luminaires designed for end-to-end connection to form a continuous assembly, or luminaires connected together by recognized wiring methods, shall be permitted to contain the conductors of a 2-wire branch circuit, or one multiwire branch circuit, supplying the connected luminaires and shall not be required to be listed as a raceway. One additional 2-wire branch circuit separately supplying one or more of the connected luminaires shall also be permitted.

Informational Note: See Article 100 for the definition of *Multiwire Branch Circuit*.

Section 410.64(C) facilitates convenient switching and supply circuit arrangements for a physically continuous row of luminaires or a row that is made continuous via the wiring method. A single 2-wire or a single multiwire branch circuit supplying the luminaires is permitted to be run through the continuous row(s), and the luminaires are not required to be listed for use as a raceway. An additional 2-wire branch cir-

cuit is permitted to be run through these luminaires. This circuit may supply only luminaires in the connected row(s) and is commonly employed to switch night lighting as an energy conservation method.

#### 410.68 Feeder and Branch-Circuit Conductors and Ballasts

Feeder and branch-circuit conductors within 75 mm (3 in.) of a ballast, LED driver, power supply, or transformer shall have an insulation temperature rating not lower than 90°C (194°F), unless supplying a luminaire marked as suitable for a different insulation temperature.

Temperature ratings, along with other insulated conductor specifications, are found in Table 310.104(A). Note the 90°C rating that is permitted to be applied to Type THW conductors for special application in electric-discharge lighting equipment. This section was revised for the 2011 *Code* to include requirements for LED installations. Listed LED drivers (including the Class 2 output type) are limited to either 75°C or 90°C, depending on which standard was used to evaluate the device. In many ways, the installation rules established for discharge lighting ballasts over the years will carry over to LED drivers. “LED driver” is a common industry term referring to the power supply for the LED.

## VII. Construction of Luminaires

#### 410.70 Combustible Shades and Enclosures

Adequate airspace shall be provided between lamps and shades or other enclosures of combustible material.

#### 410.74 Luminaire Rating

**(A) Marking.** All luminaires shall be marked with the maximum lamp wattage or electrical rating, manufacturer’s name, trademark, or other suitable means of identification. A luminaire requiring supply wire rated higher than 60°C (140°F) shall be marked with the minimum supply wire temperature rating on the luminaire and shipping carton or equivalent.

**(B) Electrical Rating.** The electrical rating shall include the voltage and frequency and shall indicate the current rating of the unit, including the ballast, transformer, LED driver, power supply, or autotransformer.

#### 410.82 Portable Luminaires

**(A) General.** Portable luminaires shall be wired with flexible cord recognized by 400.4 and an attachment plug of the polarized or grounding type. Where used with Edison-base

lampholders, the grounded conductor shall be identified and attached to the screw shell and the identified blade of the attachment plug.

**(B) Portable Handlamps.** In addition to the provisions of 410.82(A), portable handlamps shall comply with the following:

- (1) Metal shell, paper-lined lampholders shall not be used.
- (2) Handlamps shall be equipped with a handle of molded composition or other insulating material.
- (3) Handlamps shall be equipped with a substantial guard attached to the lampholder or handle.
- (4) Metallic guards shall be grounded by means of an equipment grounding conductor run with circuit conductors within the power-supply cord.
- (5) Portable handlamps shall not be required to be grounded where supplied through an isolating transformer with an ungrounded secondary of not over 50 volts.

See Exhibit 410.6 for an example of a portable handlamp (drop light) meeting the requirements of 410.82.

**EXHIBIT 410.6** A portable handlamp with a grounded metal guard and reflector and a swivel-type hook that permits the lamp to be adjusted in different positions. (Courtesy of Woodhead Industries, a division of Molex Incorporated)

#### 410.84 Cord Bushings

A bushing or the equivalent shall be provided where flexible cord enters the base or stem of a portable luminaire. The

bushing shall be of insulating material unless a jacketed type of cord is used.

### VIII. Installation of Lampholders

#### 410.90 Screw Shell Type

Lampholders of the screw shell type shall be installed for use as lampholders only. Where supplied by a circuit having a grounded conductor, the grounded conductor shall be connected to the screw shell.

Years ago, it was common practice to install screw shell lampholders with screw shell adapters in baseboards and walls to connect cord-connected appliances and lighting equipment. This now-prohibited practice permitted exposed live parts to be contacted by persons when the adapters were removed. See 406.3(B) for permitted uses of receptacles.

#### 410.93 Double-Pole Switched Lampholders

Where supplied by the ungrounded conductors of a circuit, the switching device of lampholders of the switched type shall simultaneously disconnect both conductors of the circuit.

Single-pole switching may be used to interrupt the ungrounded conductor of a 2-wire circuit having one conductor grounded. The grounded conductor must be connected to the screw shell of the lampholder.

Where a 2-wire circuit is derived from the two ungrounded conductors of a multiwire circuit (3- or 4-wire system) or from the two ungrounded conductors of a 2-wire circuit (3-wire system) and is used with switched lampholders, the switching device is required to be double-pole and to simultaneously disconnect both ungrounded conductors of the circuit. Listed lampholders, as specified by 410.6, meet the construction requirements contained in the applicable product standard.

#### 410.96 Lampholders in Wet or Damp Locations

Lampholders installed in wet locations shall be listed for use in wet locations. Lampholders installed in damp locations shall be listed for damp locations or shall be listed for wet locations.

#### 410.97 Lampholders Near Combustible Material

Lampholders shall be constructed, installed, or equipped with shades or guards so that combustible material is not subjected to temperatures in excess of 90°C (194°F).

## IX. Lamps and Auxiliary Equipment

### 410.103 Bases, Incandescent Lamps

An incandescent lamp for general use on lighting branch circuits shall not be equipped with a medium base if rated over 300 watts, or with a mogul base if rated over 1500 watts. Special bases or other devices shall be used for over 1500 watts.

### 410.104 Electric-Discharge Lamp Auxiliary Equipment

**(A) Enclosures.** Auxiliary equipment for electric-discharge lamps shall be enclosed in noncombustible cases and treated as sources of heat.

The UL *Guide Information for Electrical Equipment — The White Book*-2010 edition contains two categories for ballasts under Electric Discharge Lamp Control Equipment (FKOT): fluorescent ballasts (FKVS) and HID (high-intensity discharge) ballasts (FLCR).

Fluorescent ballast enclosures are categorized by UL as open, indoor, outdoor (both Type 1 and Type 2), and weatherproof. HID ballasts are categorized the same, except there is no open-type ballast for HID ballasts.

**Open Type.** Open core and coil constructions (i.e., ballasts without complete metal enclosures) are intended for use within suitable enclosures.

**Indoor Ballasts.** Indoor ballasts are suitable for use in an indoor, dry location only.

**Outdoor Ballasts.** Type 1 outdoor ballasts are suitable for use in (1) outdoor equipment, (2) fixtures intended for wet or damp locations, or (3) an outdoor sign if the ballasts are within an overall electrical enclosure. Ballasts of this type are marked “Type 1 Outdoor” or “Type 1.” Type 2 outdoor ballasts are suitable for use in (1) outdoor equipment, (2) fixtures intended for wet or damp locations, or (3) an outdoor sign if the ballasts, in addition to their own enclosure, are within an overall enclosure. Ballasts of this type are marked “Type 2 Outdoor” or “Type 2.”

**Weatherproof Ballasts.** Weatherproof ballasts are suitable for use where completely exposed to the weather without an additional enclosure and are marked “Weatherproof” or “WP.”

**(B) Switching.** Where supplied by the ungrounded conductors of a circuit, the switching device of auxiliary equipment shall simultaneously disconnect all conductors.

## X. Special Provisions for Flush and Recessed Luminaires

### 410.110 General

Luminaires installed in recessed cavities in walls or ceilings, including suspended ceilings, shall comply with 410.115 through 410.122.

### 410.115 Temperature

**(A) Combustible Material.** Luminaires shall be installed so that adjacent combustible material will not be subjected to temperatures in excess of 90°C (194°F).

**(B) Fire-Resistant Construction.** Where a luminaire is recessed in fire-resistant material in a building of fire-resistant construction, a temperature higher than 90°C (194°F) but not higher than 150°C (302°F) shall be considered acceptable if the luminaire is plainly marked for that service.

This section was revised for the 2011 *Code* to recognize LED lighting that is permitted to be installed in contact with thermal insulation. LED luminaires for installation in contact with thermal insulation must be identified as Type IC, which is similar to the requirements for other luminaires.

**(C) Recessed Incandescent Luminaires.** Incandescent luminaires shall have thermal protection and shall be identified as thermally protected.

Because many recessed incandescent luminaires are suitable for a wide variety of lamp sizes and types and finish trims, the temperature close to the lamp can vary widely. Therefore, many manufacturers have chosen to locate thermal protectors away from the source of heat, such as in the outlet box, and to design the protector so that it detects a change in temperature resulting from the addition of thermal insulation around the luminaire. This design prevents nuisance tripping of the protector (as a result of changing lamp wattage, for example) but still provides protection against overheating arising from thermal insulation around a recessed luminaire not designed for such use.

*Exception No. 1: Thermal protection shall not be required in a recessed luminaire identified for use and installed in poured concrete.*

*Exception No. 2: Thermal protection shall not be required in a recessed luminaire whose design, construction, and thermal performance characteristics are equivalent to a thermally protected luminaire and are identified as inherently protected.*

Recessed incandescent luminaires without thermal protection are permitted by Exception No. 2 to 410.115(C) if they are listed and identified as providing equivalent temperature protection by construction design.

Exhibit 410.7 illustrates a listed Type IC recessed luminaire installed in direct contact with thermal insulation.

**EXHIBIT 410.7** A listed Type IC recessed luminaire suitable for use in insulated ceilings and installed in direct contact with thermal insulation, per 410.116(A)(2).

Thermal protection is provided to deactivate the lamp should the luminaire be mislamped so that it overheats.

### 410.116 Clearance and Installation

#### (A) Clearance.

**(1) Non-Type IC.** A recessed luminaire that is not identified for contact with insulation shall have all recessed parts spaced not less than 13 mm (½ in.) from combustible materials. The points of support and the trim finishing off the openings in the ceiling, wall, or other finished surface shall be permitted to be in contact with combustible materials.

**(2) Type IC.** A recessed luminaire that is identified for contact with insulation, Type IC, shall be permitted to be in contact with combustible materials at recessed parts, points of support, and portions passing through or finishing off the opening in the building structure.

**(B) Installation.** Thermal insulation shall not be installed above a recessed luminaire or within 75 mm (3 in.) of the recessed luminaire's enclosure, wiring compartment, ballast, transformer, LED driver, or power supply unless the luminaire is identified as Type IC for insulation contact.

### 410.117 Wiring

**(A) General.** Conductors that have insulation suitable for the temperature encountered shall be used.

**(B) Circuit Conductors.** Branch-circuit conductors that have an insulation suitable for the temperature encountered shall be permitted to terminate in the luminaire.

**(C) Tap Conductors.** Tap conductors of a type suitable for the temperature encountered shall be permitted to run from the luminaire terminal connection to an outlet box placed at least 300 mm (1 ft) from the luminaire. Such tap conductors shall be in suitable raceway or Type AC or MC cable of at least 450 mm (18 in.) but not more than 1.8 m (6 ft) in length.

## XI. Construction of Flush and Recessed Luminaires

### 410.118 Temperature

Luminaires shall be constructed such that adjacent combustible material is not subject to temperatures in excess of 90°C (194°F).

### 410.120 Lamp Wattage Marking

Incandescent lamp luminaires shall be marked to indicate the maximum allowable wattage of lamps. The markings shall be permanently installed, in letters at least 6 mm (¼ in.) high, and shall be located where visible during relamping.

### 410.121 Solder Prohibited

No solder shall be used in the construction of a luminaire recessed housing.

### 410.122 Lampholders

Lampholders of the screw shell type shall be of porcelain or other suitable insulating materials.

## XII. Special Provisions for Electric-Discharge Lighting Systems of 1000 Volts or Less

### 410.130 General

**(A) Open-Circuit Voltage of 1000 Volts or Less.** Equipment for use with electric-discharge lighting systems and designed for an open-circuit voltage of 1000 volts or less shall be of a type identified for such service.

**(B) Considered as Energized.** The terminals of an electric-discharge lamp shall be considered as energized where any lamp terminal is connected to a circuit of over 300 volts.

**(C) Transformers of the Oil-Filled Type.** Transformers of the oil-filled type shall not be used.

**(D) Additional Requirements.** In addition to complying with the general requirements for luminaires, such equipment shall comply with Part XIII of this article.

#### (E) Thermal Protection — Fluorescent Luminaires.

**(1) Integral Thermal Protection.** The ballast of a fluorescent luminaire installed indoors shall have integral thermal

protection. Replacement ballasts shall also have thermal protection integral with the ballast.

**(2) Simple Reactance Ballasts.** A simple reactance ballast in a fluorescent luminaire with straight tubular lamps shall not be required to be thermally protected.

**(3) Exit Luminaires.** A ballast in a fluorescent exit luminaire shall not have thermal protection.

**(4) Egress Luminaires.** A ballast in a fluorescent luminaire that is used for egress lighting and energized only during a failure of the normal supply shall not have thermal protection.

Thermal protection that is integral with the ballast is required for fluorescent luminaires installed indoors. Thermally protected ballasts are also required as replacements for nonthermally protected ballasts in older fixtures. Thermally protected fluorescent lamp ballasts intended for use in accordance with 410.130(E) are marked “Class P.” LED drivers are the LED lighting system’s equivalent to ballasts. “LED driver” is a common industry term referring to the power supply for the LED.

Because different Class P ballasts have different heating characteristics, the heating characteristics should be considered when selecting replacements for nonthermally protected ballasts. This type of ballast protection is set to open the circuit at a predetermined temperature, to prevent abnormal ballast heat buildup caused by a fault in one or more of the ballast components or by some lampholder or wiring fault.

Section 410.130(E)(3) exempts exit sign fixtures from the thermal protection requirement because overheating during high ambient conditions could cause the thermal protection to operate. This action could impair evacuation during a fire.

Section 410.130(E)(4) exempts egress lighting from the thermal protection requirement for the same reason that exit signs are exempt. However, this exemption applies to egress lighting that is energized only during the emergency condition.

Exhibit 410.8 illustrates a reactance-type ballast used in series with a preheat-type fluorescent lamp 30 watts or less. This type of ballast does not require thermal protection, and the luminaire may be equipped with automatic-type starters (such as used with medicine cabinet luminaires) or a manual momentary contact starter (such as used with desk lamps and some small under-cabinet luminaires).

#### (F) High-Intensity Discharge Luminaires.

**(1) Recessed.** Recessed high-intensity luminaires designed to be installed in wall or ceiling cavities shall have thermal protection and be identified as thermally protected.

**EXHIBIT 410.8** The circuitry for a simple reactance-type ballast for fluorescent lighting.

**(2) Inherently Protected.** Thermal protection shall not be required in a recessed high-intensity luminaire whose design, construction, and thermal performance characteristics are equivalent to a thermally protected luminaire and are identified as inherently protected.

**(3) Installed in Poured Concrete.** Thermal protection shall not be required in a recessed high-intensity discharge luminaire identified for use and installed in poured concrete.

**(4) Recessed Remote Ballasts.** A recessed remote ballast for a high-intensity discharge luminaire shall have thermal protection that is integral with the ballast and shall be identified as thermally protected.

**(5) Metal Halide Lamp Containment.** Luminaires that use a metal halide lamp other than a thick-glass parabolic reflector lamp (PAR) shall be provided with a containment barrier that encloses the lamp, or shall be provided with a physical means that only allows the use of a lamp that is Type O.

Metal halide lamps have been identified as the likely cause of ignition in several major fires by insurers of large industrial facilities. HID luminaires can create an ignition source when physical damage occurs to the arc tube in open luminaires. Lamp types that are suitable for use in open luminaires (those that do not require lamp enclosures) are classified by the lamp manufacturers as Type O or Type S. Type-O lamps are provided with a shroud around the arc tube and are containment-tested in accordance with ANSI C78.387, *Electric Lamps — Metal-Halide Lamps — Methods of Measuring Characteristics*, and are rated for use in open luminaires. The Code requires luminaires that use a metal halide lamp to have either a containment barrier that encloses the lamp or some means that allows only a Type-O lamp to be installed in the luminaire.

Informational Note: See ANSI Standard C78.389, *American National Standard for Electric Lamps — High Intensity Discharge, Methods of Measuring Characteristics*.

### (G) Disconnecting Means.

**(1) General.** In indoor locations other than dwellings and associated accessory structures, fluorescent luminaires that utilize double-ended lamps and contain ballast(s) that can be serviced in place shall have a disconnecting means either internal or external to each luminaire. For existing installed luminaires without disconnecting means, at the time a ballast is replaced, a disconnecting means shall be installed. The line side terminals of the disconnecting means shall be guarded.

*Exception No. 1: A disconnecting means shall not be required for luminaires installed in hazardous (classified) location(s).*

*Exception No. 2: A disconnecting means shall not be required for emergency illumination required in 700.16.*

*Exception No. 3: For cord-and-plug-connected luminaires, an accessible separable connector or an accessible plug and receptacle shall be permitted to serve as the disconnecting means.*

*Exception No. 4: A disconnecting means shall not be required in industrial establishments with restricted public access where conditions of maintenance and supervision ensure that only qualified persons service the installation by written procedures.*

*Exception No. 5: Where more than one luminaire is installed and supplied by other than a multiwire branch circuit, a disconnecting means shall not be required for every luminaire when the design of the installation includes disconnecting means, such that the illuminated space cannot be left in total darkness.*

**(2) Multiwire Branch Circuits.** When connected to multiwire branch circuits, the disconnecting means shall simultaneously break all the supply conductors to the ballast, including the grounded conductor.

**(3) Location.** The disconnecting means shall be located so as to be accessible to qualified persons before servicing or maintaining the ballast. Where the disconnecting means is external to the luminaire, it shall be a single device, and shall be attached to the luminaire or the luminaire shall be located within sight of the disconnecting means.

Section 410.130(G) requires a disconnecting means for fluorescent luminaires that utilize double-ended lamps and contain ballasts that can be serviced in place.

The disconnect can be either inside or outside the luminaire and must disconnect all supply conductors simultaneously, including the grounded conductor. Where the disconnect means is external to the luminaire, it must be a single device either attached to the luminaire or within sight of the luminaire. Exceptions are provided for the following: hazardous (classified) locations, emergency illumination, cord-and-plug-connected luminaires, industrial facilities, and luminaires not supplied by a multiwire branch circuit and in which disconnection does not leave the illuminated space in total darkness. In addition to the ungrounded conductors, the grounded or neutral conductor of a multiwire branch circuit is required to be disconnected. This section has been revised for the 2011 *Code*. It now requires that a disconnecting means be installed when a ballast is replaced in a luminaire that does not have either an internal or an external disconnecting means.

### 410.134 Direct-Current Equipment

Luminaires installed on dc circuits shall be equipped with auxiliary equipment and resistors designed for dc operation. The luminaires shall be marked for dc operation.

### 410.135 Open-Circuit Voltage Exceeding 300 Volts

Equipment having an open-circuit voltage exceeding 300 volts shall not be installed in dwelling occupancies unless such equipment is designed so that there will be no exposed live parts when lamps are being inserted, are in place, or are being removed.

Luminaires intended for use in nondwelling occupancies are so marked, usually indicating that the luminaire has maintenance features beyond the capabilities of the ordinary homeowner or that the luminaire involves voltages in excess of those permitted by this *Code* for dwelling occupancies. For other references to voltage limitations within dwelling units, see 210.6(A) and 410.140(B).

### 410.136 Luminaire Mounting

**(A) Exposed Components.** Luminaires that have exposed ballasts, transformers, LED drivers, or power supplies shall be installed such that ballasts, transformers, LED drivers, or power supplies shall not be in contact with combustible material unless listed for such condition.

**(B) Combustible Low-Density Cellulose Fiberboard.** Where a surface-mounted luminaire containing a ballast, transformer, LED driver, or power supply is to be installed on combustible low-density cellulose fiberboard, it shall be marked for this condition or shall be spaced not less than

38 mm (1½ in.) from the surface of the fiberboard. Where such luminaires are partially or wholly recessed, the provisions of 410.110 through 410.122 shall apply.

**Informational Note:** Combustible low-density cellulose fiberboard includes sheets, panels, and tiles that have a density of 320 kg/m<sup>3</sup> (20 lb/ft<sup>3</sup>) or less and that are formed of bonded plant fiber material but does not include solid or laminated wood or fiberboard that has a density in excess of 320 kg/m<sup>3</sup> (20 lb/ft<sup>3</sup>) or is a material that has been integrally treated with fire-retarding chemicals to the degree that the flame spread in any plane of the material will not exceed 25, determined in accordance with tests for surface burning characteristics of building materials. See ANSI/ASTM E84-1997, *Test Method for Surface Burning Characteristics of Building Materials*.

This section was revised for the 2011 *Code* to provide a more inclusive list of heat-producing components, such as transformers, LED drivers, and power supplies in addition to ballasts. Luminaires intended for mounting on combustible low-density cellulose fiberboard ceilings have been evaluated with thermal insulation above the ceiling in the vicinity of the luminaire and are marked “Suitable for Surface Mounting on Combustible Low-Density Cellulose Fiberboard.”

Luminaires not so marked may be directly mounted against a ceiling surface constructed of a material other than combustible low-density fiberboard or may be spaced not less than 1½ in. from the surface of the low-density fiberboard.

#### 410.137 Equipment Not Integral with Luminaire

**(A) Metal Cabinets.** Auxiliary equipment, including reactors, capacitors, resistors, and similar equipment, where not installed as part of a luminaire assembly, shall be enclosed in accessible, permanently installed metal cabinets.

**(B) Separate Mounting.** Separately mounted ballasts, transformers, LED drivers, or power supplies that are listed for direct connection to a wiring system shall not be required to be additionally enclosed.

**(C) Wired Luminaire Sections.** Wired luminaire sections are paired, with a ballast(s) supplying a lamp or lamps in both. For interconnection between paired units, it shall be permissible to use metric designator 12 (trade size ¾) flexible metal conduit in lengths not exceeding 7.5 m (25 ft), in conformance with Article 348. Luminaire wire operating at line voltage, supplying only the ballast(s) of one of the paired luminaires shall be permitted in the same raceway as the lamp supply wires of the paired luminaires.

Wired luminaire sections are shipped in pairs and marked for use in pairs. Each individual unit includes lamps in odd-

numbered quantities (one or three is most common), with the odd lamp in each luminaire supplied by a two-lamp ballast located in one luminaire of the pair. Two-lamp ballasts are more energy efficient than single-lamp or three-lamp ballasts.

#### 410.138 Autotransformers

An autotransformer that is used to raise the voltage to more than 300 volts, as part of a ballast for supplying lighting units, shall be supplied only by a grounded system.

#### 410.139 Switches

Snap switches shall comply with 404.14.

### XIII. Special Provisions for Electric-Discharge Lighting Systems of More Than 1000 Volts

#### 410.140 General

**(A) Listing.** Electric-discharge lighting systems with an open-circuit voltage exceeding 1000 volts shall be listed and installed in conformance with that listing.

**(B) Dwelling Occupancies.** Equipment that has an open-circuit voltage exceeding 1000 volts shall not be installed in or on dwelling occupancies.

**(C) Live Parts.** The terminal of an electric-discharge lamp shall be considered as a live part.

**(D) Additional Requirements.** In addition to complying with the general requirements for luminaires, such equipment shall comply with Part XIII of this article.

**Informational Note:** For signs and outline lighting, see Article 600.

#### 410.141 Control

**(A) Disconnection.** Luminaires or lamp installation shall be controlled either singly or in groups by an externally operable switch or circuit breaker that opens all ungrounded primary conductors.

**(B) Within Sight or Locked Type.** The switch or circuit breaker shall be located within sight from the luminaires or lamps, or it shall be permitted to be located elsewhere if it is provided with a means for locking in the open position. The provisions for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.

**410.142 Lamp Terminals and Lampholders**

Parts that must be removed for lamp replacement shall be hinged or held captive. Lamps or lampholders shall be designed so that there are no exposed live parts when lamps are being inserted or removed.

**410.143 Transformers**

**(A) Type.** Transformers shall be enclosed, identified for the use, and listed.

**(B) Voltage.** The secondary circuit voltage shall not exceed 15,000 volts, nominal, under any load condition. The voltage to ground of any output terminals of the secondary circuit shall not exceed 7500 volts under any load conditions.

**(C) Rating.** Transformers shall have a secondary short-circuit current rating of not more than 150 mA if the open-circuit voltage is over 7500 volts, and not more than 300 mA if the open-circuit voltage rating is 7500 volts or less.

**(D) Secondary Connections.** Secondary circuit outputs shall not be connected in parallel or in series.

**410.144 Transformer Locations**

**(A) Accessible.** Transformers shall be accessible after installation.

**(B) Secondary Conductors.** Transformers shall be installed as near to the lamps as practicable to keep the secondary conductors as short as possible.

**(C) Adjacent to Combustible Materials.** Transformers shall be located so that adjacent combustible materials are not subjected to temperatures in excess of 90°C (194°F).

**410.145 Exposure to Damage**

Lamps shall not be located where normally exposed to physical damage.

**410.146 Marking**

Each luminaire or each secondary circuit of tubing having an open-circuit voltage of over 1000 volts shall have a clearly legible marking in letters not less than 6 mm (¼ in.) high reading "Caution \_\_\_\_ volts." The voltage indicated shall be the rated open-circuit voltage.

•

**XIV. Lighting Track****410.151 Installation**

**(A) Lighting Track.** Lighting track shall be permanently installed and permanently connected to a branch circuit. Only lighting track fittings shall be installed on lighting

track. Lighting track fittings shall not be equipped with general-purpose receptacles.

A lighting track fitting differs from a fitting as defined in Article 100, in that it usually performs both an electrical and a mechanical function. Such assemblies are not intended to be used for locating convenience receptacles or as an alternative for required receptacle outlets such as those required in 210.62 for show windows. Lighting track can be removed and relocated and therefore is not a substitute for required outlets.

**(B) Connected Load.** The connected load on lighting track shall not exceed the rating of the track. Lighting track shall be supplied by a branch circuit having a rating not more than that of the track.

Informational Note: The load calculation in 220.43(B) does not limit the length of track on a single branch circuit, and it does not limit the number of luminaires on a single track.

Section 220.43(B) addresses track lighting loads. The volt-ampere (VA) load for 2 ft of track is 150 VA because a value of 150 VA is more consistent with standard lamp values for 2 ft of track. Section 220.43(B) is not intended to limit the number of feet of track on a single branch circuit, nor is it intended to limit the number of fixtures on an individual track. Rather, 220.43(B) is intended to be used for load calculations of feeders and services. See the example following 220.43(B) for load calculation method.

**(C) Locations Not Permitted.** Lighting track shall not be installed in the following locations:

- (1) Where likely to be subjected to physical damage
- (2) In wet or damp locations
- (3) Where subject to corrosive vapors
- (4) In storage battery rooms
- (5) In hazardous (classified) locations
- (6) Where concealed
- (7) Where extended through walls or partitions
- (8) Less than 1.5 m (5 ft) above the finished floor except where protected from physical damage or track operating at less than 30 volts rms open-circuit voltage
- (9) Where prohibited by 410.10(D)

Low-voltage lighting track operating at less than 30 volts is permitted by 410.151(C)(8) to be installed less than 5 ft above the floor.

**(D) Support.** Fittings identified for use on lighting track shall be designed specifically for the track on which they are to be installed. They shall be securely fastened to the track,

shall maintain polarization and connections to the equipment grounding conductor, and shall be designed to be suspended directly from the track.

### 410.153 Heavy-Duty Lighting Track

Heavy-duty lighting track is lighting track identified for use exceeding 20 amperes. Each fitting attached to a heavy-duty lighting track shall have individual overcurrent protection.

### 410.154 Fastening

Lighting track shall be securely mounted so that each fastening is suitable for supporting the maximum weight of luminaires that can be installed. Unless identified for supports at greater intervals, a single section 1.2 m (4 ft) or shorter in length shall have two supports, and, where installed in a continuous row, each individual section of not more than 1.2 m (4 ft) in length shall have one additional support.

### 410.155 Construction Requirements

**(A) Construction.** The housing for the lighting track system shall be of substantial construction to maintain rigidity. The conductors shall be installed within the track housing, permitting insertion of a luminaire, and designed to prevent tampering and accidental contact with live parts. Components of lighting track systems of different voltages shall not be interchangeable. The track conductors shall be a minimum 12 AWG or equal and shall be copper. The track system ends shall be insulated and capped.

**(B) Grounding.** Lighting track shall be grounded in accordance with Article 250, and the track sections shall be securely coupled to maintain continuity of the circuitry, polarization, and grounding throughout.

## XV. Decorative Lighting and Similar Accessories

### 410.160 Listing of Decorative Lighting

Decorative lighting and similar accessories used for holiday lighting and similar purposes, in accordance with 590.3(B), shall be listed.

## ARTICLE 411

### Lighting Systems Operating at 30 Volts or Less

#### Contents

- 411.1 Scope
- 411.2 Definition
- 411.3 Listing Required
  - (A) Listed System
  - (B) Assembly of Listed Parts

#### 411.4 Specific Location Requirements

- (A) Walls, Floors, and Ceilings
- (B) Pools, Spas, Fountains, and Similar Locations

#### 411.5 Secondary Circuits

- (A) Grounding
- (B) Isolation
- (C) Bare Conductors
- (D) Insulated Conductors

#### 411.6 Branch Circuit

#### 411.7 Hazardous (Classified) Locations

### 411.1 Scope

This article covers lighting systems operating at 30 volts or less and their associated components.

Article 411 addresses low-voltage lighting systems. It is intended to cover low-voltage interior lighting and low-voltage exterior (landscape) lighting installations. It covers systems operating at 30 volts rms or 42.4 volts peak or less, having a maximum output of 600 VA.

### 411.2 Definition

**Lighting Systems Operating at 30 Volts or Less.** A lighting system consisting of an isolating power supply, the low-voltage luminaires, and associated equipment that are all identified for the use. The output circuits of the power supply are rated for not more than 25 amperes and operate at 30 volts (42.4 volts peak) or less under all load conditions.

### 411.3 Listing Required

Lighting systems operating at 30 volts or less shall comply with 411.3(A) or 411.3(B).

**(A) Listed System.** Lighting systems operating at 30 volts or less shall be listed as a complete system. The luminaires, power supply, and luminaire fittings (including the exposed bare conductors) of an exposed bare conductor lighting system shall be listed for the use as part of the same identified lighting system.

**(B) Assembly of Listed Parts.** A lighting system assembled from the following listed parts shall be permitted:

- (1) Low-voltage luminaires
- (2) Low-voltage luminaire power supply
- (3) Class 2 power supply
- (4) Low-voltage luminaire fittings
- (5) Cord (secondary circuit) for which the luminaires and power supply are listed for use
- (6) Cable, conductors in conduit, or other fixed wiring method for the secondary circuit

The luminaires, power supply, and luminaire fittings (including the exposed bare conductors) of an exposed bare conductor lighting system shall be listed for use as part of the same identified lighting system.

A lighting system covered by this article may be a complete listed system or an assembly of listed parts. Lighting systems operating at 30 volts or less have long been field assembled from individually listed low-voltage luminaires, listed luminaire power units, listed cord, and any involved listed luminaire fittings. Installers typically verify that individually listed lighting system parts (regularly from multiple manufacturers) are intended for the use and have the needed ratings to create and assemble a low-voltage lighting system.

#### 411.4 Specific Location Requirements

**(A) Walls, Floors, and Ceilings.** Conductors concealed or extended through a wall, floor, or ceiling shall be in accordance with (1) or (2):

- (1) Installed using any of the wiring methods specified in Chapter 3
- (2) Installed using wiring supplied by a listed Class 2 power source and installed in accordance with 725.130

**(B) Pools, Spas, Fountains, and Similar Locations.** Lighting systems shall be installed not less than 3 m (10 ft) horizontally from the nearest edge of the water, unless permitted by Article 680.

The installation requirements of 411.4 recognize that shock and fire hazards still exist, even with low-voltage systems. Low-voltage illumination systems are allowed to be installed concealed or extending through a wall, provided the system is installed in accordance either with one of the wiring methods in Chapter 3 or with 725.130 and is supplied from a listed Class 2 power supply. These systems are not allowed to be installed within 10 ft of pools, spas, fountains, or similar locations unless allowed by Article 680.

#### 411.5 Secondary Circuits

**(A) Grounding.** Secondary circuits shall not be grounded.

**(B) Isolation.** The secondary circuit shall be insulated from the branch circuit by an isolating transformer.

**(C) Bare Conductors.** Exposed bare conductors and current-carrying parts shall be permitted for indoor installations only. Bare conductors shall not be installed less than 2.1 m (7 ft) above the finished floor, unless specifically listed for a lower installation height.

**(D) Insulated Conductors.** Exposed insulated secondary circuit conductors shall be of the type, and installed as, described in (1), (2), or (3):

- (1) Class 2 cable supplied by a Class 2 power source and installed in accordance with Parts I and III of Article 725.
- (2) Conductors, cord, or cable of the listed system and installed not less than 2.1 m (7 ft) above the finished floor unless the system is specifically listed for a lower installation height.
- (3) Wiring methods described in Chapter 3

#### 411.6 Branch Circuit

Lighting systems operating at 30 volts or less shall be supplied from a maximum 20-ampere branch circuit.

#### 411.7 Hazardous (Classified) Locations

Where installed in hazardous (classified) locations, these systems shall conform with Articles 500 through 517 in addition to this article.

## I. General

### 422.1 Scope

This article covers electrical appliances used in any occupancy.

Article 422 covers electrical appliances that may be used in a dwelling unit or in commercial and industrial locations. It also covers appliances that may be fastened in place or cord-and-plug-connected, such as air-conditioning units, dishwashers, heating appliances, water heaters, and infrared heating lamps. See 422.3 for the requirements of other articles. Also see Article 100 for the definition of *appliance*.

### 422.2 Definition

**Vending Machine.** Any self-service device that dispenses products or merchandise without the necessity of replenishing the device between each vending operation and is designed to require insertion of coin, paper currency, token, card, key, or receipt of payment by other means.

### 422.3 Other Articles

The requirements of Article 430 shall apply to the installation of motor-operated appliances, and the requirements of Article 440 shall apply to the installation of appliances containing a hermetic refrigerant motor-compressor(s), except as specifically amended in this article.

### 422.4 Live Parts

Appliances shall have no live parts normally exposed to contact other than those parts functioning as open-resistance heating elements, such as the heating element of a toaster, which are necessarily exposed.

## II. Installation

### 422.10 Branch-Circuit Rating

This section specifies the ratings of branch circuits capable of carrying appliance current without overheating under the conditions specified.

Conductors that form integral parts of appliances are tested as part of the listing or labeling process.

**(A) Individual Circuits.** The rating of an individual branch circuit shall not be less than the marked rating of the appliance or the marked rating of an appliance having combined loads as provided in 422.62.

The rating of an individual branch circuit for motor-operated appliances not having a marked rating shall be in accordance with Part II of Article 430.

The branch-circuit rating for an appliance that is a continuous load, other than a motor-operated appliance, shall not be less than 125 percent of the marked rating, or not less than 100 percent of the marked rating if the branch-circuit device and its assembly are listed for continuous loading at 100 percent of its rating.

Branch circuits and branch-circuit conductors for household ranges and cooking appliances shall be permitted to be in accordance with Table 220.55 and shall be sized in accordance with 210.19(A)(3).

**(B) Circuits Supplying Two or More Loads.** For branch circuits supplying appliance and other loads, the rating shall be determined in accordance with 210.23.

## 422.11 Overcurrent Protection

Appliances shall be protected against overcurrent in accordance with 422.11(A) through (G) and 422.10.

**(A) Branch-Circuit Overcurrent Protection.** Branch circuits shall be protected in accordance with 240.4.

If a protective device rating is marked on an appliance, the branch-circuit overcurrent device rating shall not exceed the protective device rating marked on the appliance.

If a labeled or listed appliance is provided with installation instructions from the manufacturer, the branch-circuit size is not permitted to be less than the minimum size stated in the installation instructions. See 110.3(B) and its related commentary regarding the installation and use of listed or labeled equipment.

**(B) Household-Type Appliances with Surface Heating Elements.** Household-type appliances with surface heating elements having a maximum demand of more than 60 amperes calculated in accordance with Table 220.55 shall have their power supply subdivided into two or more circuits, each of which shall be provided with overcurrent protection rated at not over 50 amperes.

**(C) Infrared Lamp Commercial and Industrial Heating Appliances.** Infrared lamp commercial and industrial heating appliances shall have overcurrent protection not exceeding 50 amperes.

**(D) Open-Coil or Exposed Sheathed-Coil Types of Surface Heating Elements in Commercial-Type Heating Appliances.** Open-coil or exposed sheathed-coil types of surface heating elements in commercial-type heating appliances shall be protected by overcurrent protective devices rated at not over 50 amperes.

**(E) Single Non-motor-Operated Appliance.** If the branch circuit supplies a single non-motor-operated appliance, the rating of overcurrent protection shall comply with the following:

- (1) Not exceed that marked on the appliance.
- (2) Not exceed 20 amperes if the overcurrent protection rating is not marked and the appliance is rated 13.3 amperes or less; or
- (3) Not exceed 150 percent of the appliance rated current if the overcurrent protection rating is not marked and the appliance is rated over 13.3 amperes. Where 150 percent of the appliance rating does not correspond to a standard overcurrent device ampere rating, the next higher standard rating shall be permitted.

**(F) Electric Heating Appliances Employing Resistance-Type Heating Elements Rated More Than 48 Amperes.**

**(1) Electric Heating Appliances.** Electric heating appliances employing resistance-type heating elements rated more than 48 amperes, other than household appliances with surface heating elements covered by 422.11(B), and commercial-type heating appliances covered by 422.11(D), shall have the heating elements subdivided. Each subdivided load shall not exceed 48 amperes and shall be protected at not more than 60 amperes.

These supplementary overcurrent protective devices shall be (1) factory-installed within or on the heater enclosure or provided as a separate assembly by the heater manufacturer; (2) accessible; and (3) suitable for branch-circuit protection.

The main conductors supplying these overcurrent protective devices shall be considered branch-circuit conductors.

**(2) Commercial Kitchen and Cooking Appliances.** Commercial kitchen and cooking appliances using sheathed-type heating elements not covered in 422.11(D) shall be permitted to be subdivided into circuits not exceeding 120 amperes and protected at not more than 150 amperes where one of the following is met:

- (1) Elements are integral with and enclosed within a cooking surface.

- (2) Elements are completely contained within an enclosure identified as suitable for this use.
- (3) Elements are contained within an ASME-rated and stamped vessel.

**(3) Water Heaters and Steam Boilers.** Water heaters and steam boilers employing resistance-type immersion electric heating elements contained in an ASME-rated and stamped vessel or listed instantaneous water heaters shall be permitted to be subdivided into circuits not exceeding 120 amperes and protected at not more than 150 amperes.

**(G) Motor-Operated Appliances.** Motors of motor-operated appliances shall be provided with overload protection in accordance with Part III of Article 430. Hermetic refrigerant motor-compressors in air-conditioning or refrigerating equipment shall be provided with overload protection in accordance with Part VI of Article 440. Where appliance overcurrent protective devices that are separate from the appliance are required, data for selection of these devices shall be marked on the appliance. The minimum marking shall be that specified in 430.7 and 440.4.

### 422.12 Central Heating Equipment

Central heating equipment other than fixed electric space-heating equipment shall be supplied by an individual branch circuit.

*Exception No. 1: Auxiliary equipment, such as a pump, valve, humidifier, or electrostatic air cleaner directly associated with the heating equipment, shall be permitted to be connected to the same branch circuit.*

*Exception No. 2: Permanently connected air-conditioning equipment shall be permitted to be connected to the same branch circuit.*

Exception No. 1 to 422.12 permits the electric motors, ignition systems, controls, and so on, of fossil-fuel-fired central heating equipment to be connected to the same individual branch circuit, as defined in Article 100 under *branch circuit, individual*.

Exception No. 2 allows a permanently connected air-conditioning unit to be supplied from a branch circuit that supplies central heating equipment other than fixed electric space-heating equipment, because central heating equipment and air-conditioning equipment are considered to be noncoincident loads, meaning that the two loads are unlikely to operate at the same time.

### 422.13 Storage-Type Water Heaters

A fixed storage-type water heater that has a capacity of 450 L (120 gal) or less shall be considered a continuous load for the purposes of sizing branch circuits.

Informational Note: For branch-circuit rating, see 422.10.

The effect of the words “for the purposes of sizing branch circuits” in 422.13 is that the branch-circuit overcurrent device and conductors are required to be sized based on 125 percent of the water heater nameplate rating unless the overcurrent device and the assembly it is installed in are listed to be used at 100 percent of its continuous current rating.

### 422.14 Infrared Lamp Industrial Heating Appliances

In industrial occupancies, infrared heating appliance lamp-holders shall be permitted to be operated in series on circuits of over 150 volts to ground, provided the voltage rating of the lampholders is not less than the circuit voltage.

Each section, panel, or strip carrying a number of infrared lampholders (including the internal wiring of such section, panel, or strip) shall be considered an appliance. The terminal connection block of each such assembly shall be considered an individual outlet.

### 422.15 Central Vacuum Outlet Assemblies

**(A)** Listed central vacuum outlet assemblies shall be permitted to be connected to a branch circuit in accordance with 210.23(A).

**(B)** The ampacity of the connecting conductors shall not be less than the ampacity of the branch circuit conductors to which they are connected.

**(C)** Accessible non-current-carrying metal parts of the central vacuum outlet assembly likely to become energized shall be connected to an equipment grounding conductor in accordance with 250.110. Incidental metal parts such as screws or rivets installed into or on insulating material shall not be considered likely to become energized.

Section 422.15 permits listed central vacuum outlet devices to be connected to the ordinary 15- or 20-ampere general-purpose branch circuits that may be located in the same area in which the vacuum outlet is installed. Starting and stopping of the central vacuum system is achieved by a Class 2 control circuit that originates at the main unit of the central vacuum system. The circuit is switched at each outlet by the insertion or removal of the matching vacuum hose in the outlet. This section has been revised for the 2011 *Code* to clarify which small parts of the vacuum outlet assemblies require grounding. The new text is consistent with text in UL 1017, *Vacuum Cleaners, Blower Cleaners and Household Floor Finishing Machines*, which states: “Parts that are not considered likely to be energized are metal screws or

rivets in polymeric enclosures or faceplates, external metal springs used on a self-closing polymeric cover, and the like. Electrified wall valves connected to an extra-low voltage circuit are excluded from this requirement.”

### 422.16 Flexible Cords

**(A) General.** Flexible cord shall be permitted (1) for the connection of appliances to facilitate their frequent interchange or to prevent the transmission of noise or vibration or (2) to facilitate the removal or disconnection of appliances that are fastened in place, where the fastening means and mechanical connections are specifically designed to permit ready removal for maintenance or repair and the appliance is intended or identified for flexible cord connection.

#### **(B) Specific Appliances.**

##### **(1) Electrically Operated Kitchen Waste Disposers.**

Electrically operated kitchen waste disposers shall be permitted to be cord-and-plug-connected with a flexible cord identified as suitable for the purpose in the installation instructions of the appliance manufacturer, where all of the following conditions are met:

- (1) The flexible cord shall be terminated with a grounding-type attachment plug.

*Exception: A listed kitchen waste disposer distinctly marked to identify it as protected by a system of double insulation, or its equivalent, shall not be required to be terminated with a grounding-type attachment plug.*

- (2) The length of the cord shall not be less than 450 mm (18 in.) and not over 900 mm (36 in.).
- (3) Receptacles shall be located to avoid physical damage to the flexible cord.
- (4) The receptacle shall be accessible.

The kitchen waste disposer illustrated in Exhibit 422.1 is an example of a cord-and-plug-connected appliance with mechanical connections designed to permit removal. The cord and receptacle are designed and installed in accordance with 422.16(B)(1). To facilitate control of the waste disposer from a wall location, this receptacle is permitted to be switched by a general-use snap switch as long as the load does not exceed the requirements of 404.14(A)(3).

**(2) Built-in Dishwashers and Trash Compactors.** Built-in dishwashers and trash compactors shall be permitted to be cord-and-plug-connected with a flexible cord identified as suitable for the purpose in the installation instructions of the

**EXHIBIT 422.1** A cord-and-plug-connected kitchen waste disposer. (Courtesy of the National Electrical Contractors Association)

appliance manufacturer where all of the following conditions are met:

- (1) The flexible cord shall be terminated with a grounding-type attachment plug.

*Exception: A listed dishwasher or trash compactor distinctly marked to identify it as protected by a system of double insulation, or its equivalent, shall not be required to be terminated with a grounding-type attachment plug.*

- (2) The length of the cord shall be 0.9 m to 1.2 m (3 ft to 4 ft) measured from the face of the attachment plug to the plane of the rear of the appliance.
- (3) Receptacles shall be located to avoid physical damage to the flexible cord.
- (4) The receptacle shall be located in the space occupied by the appliance or adjacent thereto.
- (5) The receptacle shall be accessible.

**(3) Wall-Mounted Ovens and Counter-Mounted Cooking Units.** Wall-mounted ovens and counter-mounted cooking units complete with provisions for mounting and for making electrical connections shall be permitted to be permanently connected or, only for ease in servicing or for installation, cord-and-plug-connected.

A separable connector or a plug and receptacle combination in the supply line to an oven or cooking unit shall be approved for the temperature of the space in which it is located.

**(4) Range Hoods.** Range hoods shall be permitted to be cord-and-plug-connected with a flexible cord identified as suitable for use on range hoods in the installation instructions

of the appliance manufacturer, where all of the following conditions are met:

- (1) The flexible cord is terminated with a grounding-type attachment plug.

*Exception: A listed range hood distinctly marked to identify it as protected by a system of double insulation, or its equivalent, shall not be required to be terminated with a grounding-type attachment plug.*

- (2) The length of the cord is not less than 450 mm (18 in.) and not over 900 mm (36 in.).
- (3) Receptacles are located to avoid physical damage to the flexible cord.
- (4) The receptacle is accessible.
- (5) The receptacle is supplied by an individual branch circuit.

Section 422.16(B)(4) allows range hoods to be cord-and-plug-connected under five specific prerequisite conditions. A grounding-type attachment plug is not required where the range hood is identified as protected by a system of double insulation. One method of verifying such protection is to look for the mark of a testing laboratory.

### 422.17 Protection of Combustible Material

Each electrically heated appliance that is intended by size, weight, and service to be located in a fixed position shall be placed so as to provide ample protection between the appliance and adjacent combustible material.

### 422.18 Support of Ceiling-Suspended (Paddle) Fans

Ceiling-suspended (paddle) fans shall be supported independently of an outlet box or by listed outlet box or outlet box systems identified for the use and installed in accordance with 314.27(C).

Section 422.18 makes clear that paddle fans must be supported independently of the outlet box or be supported by a listed box identified for fan support. Where the outlet box is not listed or identified to support a paddle fan, the fan must be supported from the building structure, not from the outlet box. The maximum paddle fan weight allowed to be supported by an outlet box identified for support of a paddle fan is 70 lb, and where the weight exceeds 35 lb, the listed outlet box must be marked with the amount of weight it is allowed to support. Exhibit 422.2 shows an example a listed outlet box used to support a paddle fan.

**EXHIBIT 422.2** Supporting a ceiling-suspended (paddle) fan (35 lb or less) with a box identified for such use, per 422.18. (Courtesy of Hubbell RACO)

### 422.20 Other Installation Methods

Appliances employing methods of installation other than covered by this article shall be permitted to be used only by special permission.

## III. Disconnecting Means

### 422.30 General

A means shall be provided to **simultaneously** disconnect each appliance from all ungrounded conductors in accordance with the following sections of Part III. If an appliance is supplied by more than one **branch-circuit or feeder**, these disconnecting means shall be grouped and identified as the **appliance disconnect**.

### 422.31 Disconnection of Permanently Connected Appliances

**(A) Rated at Not over 300 Volt-Amperes or 1/8 Horsepower.** For permanently connected appliances rated at not over 300 volt-amperes or 1/8 hp, the branch-circuit overcurrent device shall be permitted to serve as the disconnecting means.

**(B) Appliances Rated over 300 Volt-Amperes.** For permanently connected appliances rated over 300 volt-amperes, the branch-circuit switch or circuit breaker shall be permitted to serve as the disconnecting means where the switch or circuit breaker is within sight from the appliance or is capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the

disconnecting means and shall remain in place with or without the lock installed.

Section 422.31(B) requires a special locking device for service and maintenance personnel. A device that is attached to the circuit breaker handle by a set screw is not an acceptable means to serve as a safe method of locking the device in the “off” position. The device must have provisions for placement of a lock on it to secure the device in the “off” position. The lockout device must be part of the disconnect assembly and must remain in place after the padlock is removed, whether it is a fused disconnect switch, a single circuit breaker, or a circuit breaker in a panelboard. See 422.33(B) for electric ranges.

Informational Note: For appliances employing unit switches, see 422.34.

**(C) Motor-Operated Appliances Rated over  $\frac{1}{8}$  Horsepower.** For permanently connected motor-operated appliances with motors rated over  $\frac{1}{8}$  horse power, the branch-circuit switch or circuit breaker shall be permitted to serve as the disconnecting means where the switch or circuit breaker is within sight from the appliance. The disconnecting means shall comply with 430.109 and 430.110.

Section 422.31 was revised and 422.32 was deleted for the 2011 *Code*. These changes are intended to clarify the requirements of these sections. Section 422.31(B) allows the branch-circuit switch or circuit breaker disconnecting means for an appliance rated over  $\frac{1}{8}$  horsepower to be locked in the open position. To clarify the intent, motor-operated appliances rated over  $\frac{1}{8}$  horsepower have been removed from 422.31(B) and a new section, 422.31(C), has been created to address appliances rated over  $\frac{1}{8}$  horsepower. This is intended to clarify that for a motor rated over  $\frac{1}{8}$  horsepower, the disconnecting means requirements are more restrictive. The requirements of former section 422.32 were merged into new 422.31(C). Since this section references an appliance’s horsepower rating, a motor-driven appliance is implied. The reference to motor controllers is unnecessary, as the controller is part of the appliance. If there is a separate controller, the equipment would be subject to the installation requirements of Article 430. The exception was modified to correlate with new section 422.31(C).

*Exception: If an appliance of more than  $\frac{1}{8}$  hp is provided with a unit switch that complies with 422.34(A), (B), (C), or (D), the switch or circuit breaker serving as the other disconnecting means shall be permitted to be out of sight from the appliance.*

### 422.33 Disconnection of Cord-and-Plug-Connected Appliances

**(A) Separable Connector or an Attachment Plug and Receptacle.** For cord-and-plug-connected appliances, an accessible separable connector or an accessible plug and receptacle shall be permitted to serve as the disconnecting means. Where the separable connector or plug and receptacle are not accessible, cord-and-plug-connected appliances shall be provided with disconnecting means in accordance with 422.31.

**(B) Connection at the Rear Base of a Range.** For cord-and-plug-connected household electric ranges, an attachment plug and receptacle connection at the rear base of a range, if it is accessible from the front by removal of a drawer, shall be considered as meeting the intent of 422.33(A).

**(C) Rating.** The rating of a receptacle or of a separable connector shall not be less than the rating of any appliance connected thereto.

*Exception: Demand factors authorized elsewhere in this Code shall be permitted to be applied to the rating of a receptacle or of a separable connector.*

### 422.34 Unit Switch(es) as Disconnecting Means

A unit switch(es) with a marked-off position that is a part of an appliance and disconnects all ungrounded conductors shall be permitted as the disconnecting means required by this article where other means for disconnection are provided in occupancies specified in 422.34(A) through (D).

**(A) Multifamily Dwellings.** In multifamily dwellings, the other disconnecting means shall be within the dwelling unit, or on the same floor as the dwelling unit in which the appliance is installed, and shall be permitted to control lamps and other appliances.

**(B) Two-Family Dwellings.** In two-family dwellings, the other disconnecting means shall be permitted either inside or outside of the dwelling unit in which the appliance is installed. In this case, an individual switch or circuit breaker for the dwelling unit shall be permitted and shall also be permitted to control lamps and other appliances.

**(C) One-Family Dwellings.** In one-family dwellings, the service disconnecting means shall be permitted to be the other disconnecting means.

**(D) Other Occupancies.** In other occupancies, the branch-circuit switch or circuit breaker, where readily accessible for

servicing of the appliance, shall be permitted as the other disconnecting means.

#### 422.35 Switch and Circuit Breaker to Be Indicating

Switches and circuit breakers used as disconnecting means shall be of the indicating type.

### IV. Construction

#### 422.40 Polarity in Cord-and-Plug-Connected Appliances

If the appliance is provided with a manually operated, line-connected, single-pole switch for appliance on–off operation, an Edison-base lampholder, or a 15- or 20-ampere receptacle, the attachment plug shall be of the polarized or grounding type.

A 2-wire, nonpolarized attachment plug shall be permitted to be used on a listed double-insulated shaver.

Informational Note: For polarity of Edison-base lampholders, see 410.82(A).

#### 422.41 Cord-and-Plug-Connected Appliances Subject to Immersion

Cord-and-plug-connected portable, freestanding hydromassage units and hand-held hair dryers shall be constructed to provide protection for personnel against electrocution when immersed while in the “on” or “off” position.

Although receptacles in bathrooms of dwelling units have been required to be protected by ground-fault circuit interrupters since the 1975 edition of the *Code*, many receptacles in existing bathrooms are not so protected. Cord-and-plug-connected appliances such as hand-held hair dryers and curling irons, which can and have accidentally fallen into bathtubs, causing fatalities, are required to be provided with some form of protective device that is part of the appliance. Three types of protectors comply with this requirement:

1. Appliance-leakage circuit interrupters (ALCIs)
2. Immersion-detector circuit interrupters (IDCIs)
3. Ground-fault circuit interrupters (GFCIs)

ALCIs de-energize the supply to the appliance when leakage current exceeds a predetermined value. IDCIs de-energize the supply when a liquid causes a conductive path between a live part and a sensor, and GFCIs de-energize the supply when the current to ground exceeds a predetermined value.

#### 422.42 Signals for Heated Appliances

In other than dwelling-type occupancies, each electrically heated appliance or group of appliances intended to be ap-

plied to combustible material shall be provided with a signal or an integral temperature-limiting device.

For electrically heated appliances in commercial or industrial locations, a common way to comply with 422.42 is to use a red light, connected to and within sight of the appliance, which indicates that the appliance is energized and operating. No signal is required for an electrically heated appliance provided with an integral high-temperature limiting device, such as a thermostat, that limits the temperature to which the appliance can heat.

#### 422.43 Flexible Cords

(A) **Heater Cords.** All cord-and-plug-connected smoothing irons and electrically heated appliances that are rated at more than 50 watts and produce temperatures in excess of 121°C (250°F) on surfaces with which the cord is likely to be in contact shall be provided with one of the types of approved heater cords listed in Table 400.4.

(B) **Other Heating Appliances.** All other cord-and-plug-connected electrically heated appliances shall be connected with one of the approved types of cord listed in Table 400.4, selected in accordance with the usage specified in that table.

#### 422.44 Cord-and-Plug-Connected Immersion Heaters

Electric heaters of the cord-and-plug-connected immersion type shall be constructed and installed so that current-carrying parts are effectively insulated from electrical contact with the substance in which they are immersed.

#### 422.45 Stands for Cord-and-Plug-Connected Appliances

Each smoothing iron and other cord-and-plug-connected electrically heated appliance intended to be applied to combustible material shall be equipped with an approved stand, which shall be permitted to be a separate piece of equipment or a part of the appliance.

#### 422.46 Flatirons

Electrically heated smoothing irons shall be equipped with an identified temperature-limiting means.

#### 422.47 Water Heater Controls

All storage or instantaneous-type water heaters shall be equipped with a temperature-limiting means in addition to its control thermostat to disconnect all ungrounded conductors. Such means shall comply with both of the following:

- (1) Installed to sense maximum water temperature.
- (2) Be either a trip-free, manually reset type or a type having a replacement element. Such water heaters shall be

marked to require the installation of a temperature and pressure relief valve.

*Exception No. 1: Storage water heaters that are identified as being suitable for use with a supply water temperature of 82°C (180°F) or above and a capacity of 60 kW or above.*

*Exception No. 2: Instantaneous-type water heaters that are identified as being suitable for such use, with a capacity of 4 L (1 gal) or less.*

Informational Note: See ANSI Z21.22-1999/CSA 4.4-M99, *Relief Valves for Hot Water Supply Systems*.

#### 422.48 Infrared Lamp Industrial Heating Appliances

**(A) 300 Watts or Less.** Infrared heating lamps rated at 300 watts or less shall be permitted with lampholders of the medium-base, unswitched porcelain type or other types identified as suitable for use with infrared heating lamps rated 300 watts or less.

**(B) Over 300 Watts.** Screw shell lampholders shall not be used with infrared lamps rated over 300 watts, unless the lampholders are identified as being suitable for use with infrared heating lamps rated over 300 watts.

Infrared (heat) radiation lamps are tungsten-filament incandescent lamps similar in appearance to lighting lamps. However, they are designed to operate at a lower temperature, thus transferring more heat radiation and less light intensity. Infrared lamps are used for a variety of heating and drying purposes in industrial locations.

#### 422.49 High-Pressure Spray Washers

All single-phase cord-and-plug-connected high-pressure spray washing machines rated at 250 volts or less shall be provided with factory-installed ground-fault circuit-interrupter protection for personnel. The ground-fault circuit interrupter shall be an integral part of the attachment plug or shall be located in the supply cord within 300 mm (12 in.) of the attachment plug.

High-pressure spray washers may be used without a GFCI as part of the supply cord if the washers are rated 3-phase or are over 250 volts.

#### 422.50 Cord-and-Plug-Connected Pipe Heating Assemblies

Cord-and-plug-connected pipe heating assemblies intended to prevent freezing of piping shall be listed.

The listing requirement in 422.50 is a result of data that substantiated numerous fires initiated by heat tapes. Additional requirements for ground-fault protection equipment are found in 427.22.

#### 422.51 Cord-and-Plug-Connected Vending Machines

Cord-and-plug-connected vending machines manufactured or remanufactured on or after January 1, 2005, shall include a ground-fault circuit interrupter as an integral part of the attachment plug or be located within 300 mm (12 in.) of the attachment plug. Older vending machines manufactured or remanufactured prior to January 1, 2005, shall be connected to a GFCI-protected outlet.

Informational Note: For further information, see ANSI/UL 541-2005, *Standard for Refrigerated Vending Machines*, or ANSI/UL 751-2005, *Standard for Vending Machines*.

Section 422.51 provides added safety to consumers who purchase items from cord-and-plug-connected vending machines. The U.S. Consumer Product Safety Commission (CPSC) has investigated four electrocutions in four separate incidents since 1995 and three incidents involving vending machines that resulted in nonfatal shocks. Those investigations spurred this requirement that new and remanufactured vending machines be provided with a GFCI as an integral part of the power-supply cord within 12 in. of the attachment plug. Older machines manufactured or re-manufactured before January 1, 2005, are required to be plugged into a GFCI-protected receptacle outlet. There are no voltage or current restrictions to this requirement for GFCI. See the definition of *vending machine* in 422.2.

#### 422.52 Electric Drinking Fountains

Electric drinking fountains shall be protected with ground-fault circuit-interrupter protection.

Section 422.52 requires GFCI protection for electric water drinking fountains. The GFCI protection must be either a part of the fountain, included in the receptacle for the fountain, or provided on the branch circuit feeding the fountain.

### V. Marking

#### 422.60 Nameplate

**(A) Nameplate Marking.** Each electrical appliance shall be provided with a nameplate giving the identifying name and the rating in volts and amperes, or in volts and watts. If the appliance is to be used on a specific frequency or frequencies, it shall be so marked.

Where motor overload protection external to the appliance is required, the appliance shall be so marked.

Informational Note: See 422.11 for overcurrent protection requirements.

**(B) To Be Visible.** Marking shall be located so as to be visible or easily accessible after installation.

### 422.61 Marking of Heating Elements

All heating elements that are rated over one ampere, replaceable in the field, and a part of an appliance shall be legibly marked with the ratings in volts and amperes, or in volts and watts, or with the manufacturer's part number.

### 422.62 Appliances Consisting of Motors and Other Loads

**(A) Nameplate Horsepower Markings.** Where a motor-operated appliance nameplate includes a horsepower rating, that rating shall not be less than the horsepower rating on the motor nameplate. Where an appliance consists of multiple motors, or one or more motors and other loads, the nameplate value shall not be less than the equivalent horsepower of the combined loads, calculated in accordance with 430.110(C)(1).

**(B) Additional Nameplate Markings.** Appliances, other than those factory-equipped with cords and attachment plugs and with nameplates in compliance with 422.60, shall be marked in accordance with 422.62(B)(1) or (B)(2).

**(1) Marking.** In addition to the marking required in 422.60, the marking on an appliance consisting of a motor with other load(s) or motors with or without other load(s) shall specify the minimum supply circuit conductor ampacity and the maximum rating of the circuit overcurrent protective device. This requirement shall not apply to an appliance with a nameplate in compliance with 422.60 where both the minimum supply circuit conductor ampacity and maximum rating of the circuit overcurrent protective device are not more than 15 amperes.

**(2) Alternate Marking Method.** An alternative marking method shall be permitted to specify the rating of the largest motor in volts and amperes, and the additional load(s) in volts and amperes, or volts and watts in addition to the marking required in 422.60. The ampere rating of a motor  $\frac{1}{8}$  horsepower or less or a nonmotor load 1 ampere or less shall be permitted to be omitted unless such loads constitute the principal load.

## I. General

### 424.1 Scope

This article covers fixed electric equipment used for space heating. For the purpose of this article, heating equipment shall include heating cable, unit heaters, boilers, central systems, or other approved fixed electric space-heating equipment. This article shall not apply to process heating and room air conditioning.

### 424.2 Other Articles

Fixed electric space-heating equipment incorporating a hermetic refrigerant motor-compressor shall also comply with Article 440.

### 424.3 Branch Circuits

**(A) Branch-Circuit Requirements.** Individual branch circuits shall be permitted to supply any volt-ampere or wattage rating of fixed electric space-heating equipment for which they are rated.

Branch circuits supplying two or more outlets for fixed electric space-heating equipment shall be rated 15, 20, 25, or 30 amperes. In other than a dwelling unit, fixed infrared heating equipment shall be permitted to be supplied from branch circuits rated not over 50 amperes.

**(B) Branch-Circuit Sizing.** Fixed electric space-heating equipment and motors shall be considered continuous load.

Section 424.3(B) states that the branch circuits sized for fixed electric space-heating equipment must be considered a continuous load. As such, the sizing of branch-circuit conductors and overcurrent devices supplying fixed electric space-heating equipment is at 125 percent of the total load of the heaters (and motors) and is predicated on the need to protect overcurrent devices, particularly in panelboards, and conductors from overheating during periods of prolonged operation.

The requirement in 424.3(B) eliminates any question about whether the heating equipment is a continuous load, as defined in Article 100. This requirement also impacts feeders and services that supply fixed electric space-heating equipment branch circuits.

### 424.6 Listed Equipment

Electric baseboard heaters, heating cables, duct heaters, and radiant heating systems shall be listed and labeled.

## II. Installation

### 424.9 General

All fixed electric space-heating equipment shall be installed in an approved manner.

Permanently installed electric baseboard heaters equipped with factory-installed receptacle outlets, or outlets provided as a separate listed assembly, shall be permitted in lieu of a receptacle outlet(s) that is required by 210.50(B). Such receptacle outlets shall not be connected to the heater circuits.

Informational Note: Listed baseboard heaters include instructions that may not permit their installation below receptacle outlets.

The second paragraph of 424.9 restates the permission granted in the second paragraph of 210.52 — that is, it allows factory-installed receptacle outlets in electric baseboard heaters to satisfy the spacing requirements for receptacle outlets in dwelling units according to 210.52(A).

Heating equipment and systems often have special installation instructions for spacings, types of supply wires, or special control equipment, which must be considered in determining the suitability of the installation.

### 424.10 Special Permission

Fixed electric space-heating equipment and systems installed by methods other than covered by this article shall be permitted only by special permission.

### 424.11 Supply Conductors

Fixed electric space-heating equipment requiring supply conductors with over 60°C insulation shall be clearly and permanently marked. This marking shall be plainly visible after installation and shall be permitted to be adjacent to the field connection box.

Fixed electric space-heating equipment may require supply conductors with a temperature rating greater than 60°C, due to their proximity to the heating elements and the installation instructions provided with a listed product.

### 424.12 Locations

**(A) Exposed to Physical Damage.** Where subject to physical damage, fixed electric space-heating equipment shall be protected in an approved manner.

**(B) Damp or Wet Locations.** Heaters and related equipment installed in damp or wet locations shall be listed for such locations and shall be constructed and installed so that

water or other liquids cannot enter or accumulate in or on wired sections, electrical components, or ductwork.

Informational Note No. 1: See 110.11 for equipment exposed to deteriorating agents.

Informational Note No. 2: See 680.27(C) for pool deck areas.

### 424.13 Spacing from Combustible Materials

Fixed electric space-heating equipment shall be installed to provide the required spacing between the equipment and adjacent combustible material, unless it is listed to be installed in direct contact with combustible material.

## III. Control and Protection of Fixed Electric Space-Heating Equipment

### 424.19 Disconnecting Means

Means shall be provided to simultaneously disconnect the heater, motor controller(s), and supplementary overcurrent protective device(s) of all fixed electric space-heating equipment from all ungrounded conductors. Where heating equipment is supplied by more than one source, the disconnecting means shall be grouped and marked. The disconnecting means specified in 424.19(A) and (B) shall have an ampere rating not less than 125 percent of the total load of the motors and the heaters. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.

Section 424.19 requires that the disconnecting means simultaneously open all the ungrounded conductors to prevent the practice of disconnecting one conductor at a time at terminal blocks or similar devices. The disconnect switch must have a rating of 125 percent of the total load of the heater, per 424.19(A) and (B). In addition, a means to add a lock to the disconnect is required. The mechanism for adding the lock must remain in place even when the lock is removed. In the past, an installer or maintainer may or may not have had the specific type of temporary mechanism needed to lock the disconnecting means. Now the disconnecting means will have locking provisions that cannot be easily removed.

Section 424.19(C) permits a unit switch to serve as the disconnecting means, provided that it has a marked “off” position and disconnects all ungrounded conductors and that other means are also provided in accordance with 424.19(C)(1) through (C)(4). Such other means are not required to be capable of being locked in the open position as required by 424.19(B)(1).

Section 424.19(A)(2) was revised for the 2011 *Code*. It now correlates with 422.31(C) by requiring disconnecting

means for appliances that consist of heaters with motors of over  $\frac{1}{8}$  horsepower to comply with Part IX of Article 430.

**(A) Heating Equipment with Supplementary Overcurrent Protection.** The disconnecting means for fixed electric space-heating equipment with supplementary overcurrent protection shall be within sight from the supplementary overcurrent protective device(s), on the supply side of these devices, if fuses, and, in addition, shall comply with either 424.19(A)(1) or (A)(2).

**(1) Heater Containing No Motor Rated over  $\frac{1}{8}$  Horsepower.** The above disconnecting means or unit switches complying with 424.19(C) shall be permitted to serve as the required disconnecting means for both the motor controller(s) and heater under either of the following conditions:

- (1) The disconnecting means provided is also within sight from the motor controller(s) and the heater.
- (2) The disconnecting means provided is capable of being locked in the open (off) position.

**(2) Heater Containing a Motor(s) Rated over  $\frac{1}{8}$  Horsepower.** The above disconnecting means shall be permitted to serve as the required disconnecting means for both the motor controller(s) and heater under either of the following conditions:

- (1) Where the disconnecting means is in sight from the motor controller(s) and the heater and complies with Part IX of Article 430.
- (2) Where a motor(s) of more than  $\frac{1}{8}$  hp and the heater are provided with a single unit switch that complies with 422.34(A), (B), (C), or (D), the disconnecting means shall be permitted to be out of sight from the motor controller.

**(B) Heating Equipment Without Supplementary Overcurrent Protection.**

**(1) Without Motor or with Motor Not over  $\frac{1}{8}$  Horsepower.** For fixed electric space-heating equipment without a motor rated over  $\frac{1}{8}$  hp, the branch-circuit switch or circuit breaker shall be permitted to serve as the disconnecting means where the switch or circuit breaker is within sight from the heater or is capable of being locked in the open (off) position.

**(2) Over  $\frac{1}{8}$  Horsepower.** For motor-driven electric space-heating equipment with a motor rated over  $\frac{1}{8}$  hp, a disconnecting means shall be located within sight from the motor controller or shall be permitted to comply with the requirements in 424.19(A)(2).

**(C) Unit Switch(es) as Disconnecting Means.** A unit switch(es) with a marked “off” position that is part of a fixed heater and disconnects all ungrounded conductors shall be permitted as the disconnecting means required by this article where other means for disconnection are provided in the types of occupancies in 424.19(C)(1) through (C)(4).

**(1) Multifamily Dwellings.** In multifamily dwellings, the other disconnecting means shall be within the dwelling unit, or on the same floor as the dwelling unit in which the fixed heater is installed, and shall also be permitted to control lamps and appliances.

**(2) Two-Family Dwellings.** In two-family dwellings, the other disconnecting means shall be permitted either inside or outside of the dwelling unit in which the fixed heater is installed. In this case, an individual switch or circuit breaker for the dwelling unit shall be permitted and shall also be permitted to control lamps and appliances.

**(3) One-Family Dwellings.** In one-family dwellings, the service disconnecting means shall be permitted to be the other disconnecting means.

**(4) Other Occupancies.** In other occupancies, the branch-circuit switch or circuit breaker, where readily accessible for servicing of the fixed heater, shall be permitted as the other disconnecting means.

## 424.20 Thermostatically Controlled Switching Devices

**(A) Serving as Both Controllers and Disconnecting Means.** Thermostatically controlled switching devices and combination thermostats and manually controlled switches shall be permitted to serve as both controllers and disconnecting means, provided they meet all of the following conditions:

- (1) Provided with a marked “off” position
- (2) Directly open all ungrounded conductors when manually placed in the “off” position
- (3) Designed so that the circuit cannot be energized automatically after the device has been manually placed in the “off” position
- (4) Located as specified in 424.19

**(B) Thermostats That Do Not Directly Interrupt All Ungrounded Conductors.** Thermostats that do not directly interrupt all ungrounded conductors and thermostats that operate remote-control circuits shall not be required to meet the requirements of 424.20(A). These devices shall not be permitted as the disconnecting means.

## 424.21 Switch and Circuit Breaker to Be Indicating

Switches and circuit breakers used as disconnecting means shall be of the indicating type.

## 424.22 Overcurrent Protection

**(A) Branch-Circuit Devices.** Electric space-heating equipment, other than such motor-operated equipment as required by Articles 430 and 440 to have additional overcurrent protection, shall be permitted to be protected against overcurrent where supplied by one of the branch circuits in Article 210.

**(B) Resistance Elements.** Resistance-type heating elements in electric space-heating equipment shall be protected at not more than 60 amperes. Equipment rated more than 48 amperes and employing such elements shall have the heating elements subdivided, and each subdivided load shall not exceed 48 amperes. Where a subdivided load is less than 48 amperes, the rating of the supplementary overcurrent protective device shall comply with 424.3(B). A boiler employing resistance-type immersion heating elements contained in an ASME-rated and stamped vessel shall be permitted to comply with 424.72(A).

The reason for subdividing the overcurrent protection is to minimize the amount of damaging energy released into the heating elements during a short circuit, thereby reducing the risk of fire. In addition to safety, a second benefit may be partial continuity of service.

When a short circuit occurs, large amounts of damaging energy are released. This damage comes in the form of both heat and magnetic energy. By limiting the size of the overcurrent device protecting the individual heating elements, the damaging short-circuit energy released at the element is greatly reduced, thereby greatly reducing the risk of fire.

Historically, the subdivision size of 60 amperes was originally selected to use the maximum fuseholder size of 60 amperes while maintaining up to a 48-ampere heating element size ( $48 \text{ amperes} \times 125\% = 60 \text{ amperes}$ ).

The following example makes a strong case for the 60-ampere subdivision requirement when a short circuit occurs at the element level. Although this example uses fuses, the same case can be made using circuit breakers.

### Calculation Example

A 200-kW, 3-phase, 480-volt resistance-type unit heater has a phase current of 240.6 amperes. If the subdivision rule of 424.22(B) was not observed and this load was to be protected by just one device, the selected overcurrent device could be sized by multiplying 240.6 amperes times 125 percent and selecting a maximum overcurrent protective device

sized 350 amperes. If the subdivision requirement is followed, the heater would probably contain six separately protected internal circuits limited in size to 60 amperes.

*Conclusion:* According to the UL *Guide Information for Electrical Equipment — The White Book*-2010 edition, the energy let-through of a 350-ampere fuse can be compared to the energy let-through of a 60-ampere fuse. In the fuse section (JCQR), the let-through energy, approximated by the current squared and then multiplied by the time, or  $I^2t$ , is provided for various fuse classes (UL).

For this example, a 600-volt, 60-ampere Class T fuse could have a let-through,  $I^2t$ , as high as 30,000 ampere squared seconds. But a 600-volt, 350-ampere Class T fuse could have a let-through,  $I^2t$ , as high as 1,100,000 ampere squared seconds. That means the 350-ampere fuse could let through 36.67 times as much damaging energy as the 60-ampere fuse during a short circuit. The difference in energy let-through between these two overcurrent devices (the single 350-ampere device and the group of 60-ampere devices) is significant enough to make the difference between replacing a single element or replacing a significant portion of the entire system.

**(C) Overcurrent Protective Devices.** The supplementary overcurrent protective devices for the subdivided loads specified in 424.22(B) shall be (1) factory-installed within or on the heater enclosure or supplied for use with the heater as a separate assembly by the heater manufacturer; (2) accessible, but shall not be required to be readily accessible; and (3) suitable for branch-circuit protection.

Informational Note: See 240.10.

Where cartridge fuses are used to provide this overcurrent protection, a single disconnecting means shall be permitted to be used for the several subdivided loads.

Informational Note No. 1: For supplementary overcurrent protection, see 240.10.

Informational Note No. 2: For disconnecting means for cartridge fuses in circuits of any voltage, see 240.40.

**(D) Branch-Circuit Conductors.** The conductors supplying the supplementary overcurrent protective devices shall be considered branch-circuit conductors.

Where the heaters are rated 50 kW or more, the conductors supplying the supplementary overcurrent protective devices specified in 424.22(C) shall be permitted to be sized at not less than 100 percent of the nameplate rating of the heater, provided all of the following conditions are met:

- (1) The heater is marked with a minimum conductor size.
- (2) The conductors are not smaller than the marked minimum size.

- (3) A temperature-actuated device controls the cyclic operation of the equipment.

**(E) Conductors for Subdivided Loads.** Field-wired conductors between the heater and the supplementary overcurrent protective devices shall be sized at not less than 125 percent of the load served. The supplementary overcurrent protective devices specified in 424.22(C) shall protect these conductors in accordance with 240.4.

Where the heaters are rated 50 kW or more, the ampacity of field-wired conductors between the heater and the supplementary overcurrent protective devices shall be permitted to be not less than 100 percent of the load of their respective subdivided circuits, provided all of the following conditions are met:

- (1) The heater is marked with a minimum conductor size.
- (2) The conductors are not smaller than the marked minimum size.
- (3) A temperature-activated device controls the cyclic operation of the equipment.

## IV. Marking of Heating Equipment

### 424.28 Nameplate

**(A) Marking Required.** Each unit of fixed electric space-heating equipment shall be provided with a nameplate giving the identifying name and the normal rating in volts and watts or in volts and amperes.

Electric space-heating equipment intended for use on alternating current only, direct current only, or both shall be marked to so indicate. The marking of equipment consisting of motors over  $\frac{1}{8}$  hp and other loads shall specify the rating of the motor in volts, amperes, and frequency, and the heating load in volts and watts or in volts and amperes.

**(B) Location.** This nameplate shall be located so as to be visible or easily accessible after installation.

### 424.29 Marking of Heating Elements

All heating elements that are replaceable in the field and are part of an electric heater shall be legibly marked with the ratings in volts and watts or in volts and amperes.

## V. Electric Space-Heating Cables

### 424.34 Heating Cable Construction

Heating cables shall be furnished complete with factory-assembled nonheating leads at least 2.1 m (7 ft) in length.

### 424.35 Marking of Heating Cables

Each unit shall be marked with the identifying name or identification symbol, catalog number, and ratings in volts and watts or in volts and amperes.

Each unit length of heating cable shall have a permanent legible marking on each nonheating lead located within 75 mm (3 in.) of the terminal end. The lead wire shall have the following color identification to indicate the circuit voltage on which it is to be used:

- (1) 120 volt, nominal — yellow
- (2) 208 volt, nominal — blue
- (3) 240 volt, nominal — red
- (4) 277 volt, nominal — brown
- (5) 480 volt, nominal — orange

#### 424.36 Clearances of Wiring in Ceilings

Wiring located above heated ceilings shall be spaced not less than 50 mm (2 in.) above the heated ceiling and shall be considered as operating at an ambient temperature of 50°C (122°F). The ampacity of conductors shall be calculated on the basis of the correction factors shown in the 0–2000 volt ampacity tables of Article 310. If this wiring is located above thermal insulation having a minimum thickness of 50 mm (2 in.), the wiring shall not require correction for temperature.

#### 424.38 Area Restrictions

**(A) Shall Not Extend Beyond the Room or Area.** Heating cables shall not extend beyond the room or area in which they originate.

**(B) Uses Prohibited.** Heating cables shall not be installed in the following:

- (1) In closets
- (2) Over walls
- (3) Over partitions that extend to the ceiling, unless they are isolated single runs of embedded cable
- (4) Over cabinets whose clearance from the ceiling is less than the minimum horizontal dimension of the cabinet to the nearest cabinet edge that is open to the room or area

**(C) In Closet Ceilings as Low-Temperature Heat Sources to Control Relative Humidity.** The provisions of 424.38(B) shall not prevent the use of cable in closet ceilings as low-temperature heat sources to control relative humidity, provided they are used only in those portions of the ceiling that are unobstructed to the floor by shelves or other permanent luminaires.

#### 424.39 Clearance from Other Objects and Openings

Heating elements of cables shall be separated at least 200 mm (8 in.) from the edge of outlet boxes and junction boxes that are to be used for mounting surface luminaires. A clearance of not less than 50 mm (2 in.) shall be provided from recessed luminaires and their trims, ventilating openings,

and other such openings in room surfaces. No heating cable shall be covered by any surface-mounted equipment.

#### 424.40 Splices

Embedded cables shall be spliced only where necessary and only by approved means, and in no case shall the length of the heating cable be altered.

#### 424.41 Installation of Heating Cables on Dry Board, in Plaster, and on Concrete Ceilings

**(A) In Walls.** Cables shall not be installed in walls unless it is necessary for an isolated single run of cable to be installed down a vertical surface to reach a dropped ceiling.

**(B) Adjacent Runs.** Adjacent runs of cable not exceeding 9 watts/m (2¾ watts/ft) shall not be installed less than 38 mm (1½ in.) on centers.

**(C) Surfaces to Be Applied.** Heating cables shall be applied only to gypsum board, plaster lath, or other fire-resistant material. With metal lath or other electrically conductive surfaces, a coat of plaster shall be applied to completely separate the metal lath or conductive surface from the cable.

Informational Note: See also 424.41(F).

**(D) Splices.** All heating cables, the splice between the heating cable and nonheating leads, and 75-mm (3-in.) minimum of the nonheating lead at the splice shall be embedded in plaster or dry board in the same manner as the heating cable.

**(E) Ceiling Surface.** The entire ceiling surface shall have a finish of thermally noninsulating sand plaster that has a nominal thickness of 13 mm (½ in.), or other noninsulating material identified as suitable for this use and applied according to specified thickness and directions.

**(F) Secured.** Cables shall be secured by means of approved stapling, tape, plaster, nonmetallic spreaders, or other approved means either at intervals not exceeding 400 mm (16 in.) or at intervals not exceeding 1.8 m (6 ft) for cables identified for such use. Staples or metal fasteners that straddle the cable shall not be used with metal lath or other electrically conductive surfaces.

**(G) Dry Board Installations.** In dry board installations, the entire ceiling below the heating cable shall be covered with gypsum board not exceeding 13 mm (½ in.) thickness. The void between the upper layer of gypsum board, plaster lath, or other fire-resistant material and the surface layer of gypsum board shall be completely filled with thermally conductive, nonshrinking plaster or other approved material or equivalent thermal conductivity.

**(H) Free from Contact with Conductive Surfaces.** Cables shall be kept free from contact with metal or other electrically conductive surfaces.

**(I) Joists.** In dry board applications, cable shall be installed parallel to the joist, leaving a clear space centered under the joist of 65 mm (2½ in.) (width) between centers of adjacent runs of cable. A surface layer of gypsum board shall be mounted so that the nails or other fasteners do not pierce the heating cable.

**(J) Crossing Joists.** Cables shall cross joists only at the ends of the room unless the cable is required to cross joists elsewhere in order to satisfy the manufacturer's instructions that the installer avoid placing the cable too close to ceiling penetrations and luminaires.

#### 424.42 Finished Ceilings

Finished ceilings shall not be covered with decorative panels or beams constructed of materials that have thermal insulating properties, such as wood, fiber, or plastic. Finished ceilings shall be permitted to be covered with paint, wallpaper, or other approved surface finishes.

#### 424.43 Installation of Nonheating Leads of Cables

**(A) Free Nonheating Leads.** Free nonheating leads of cables shall be installed in accordance with approved wiring methods from the junction box to a location within the ceiling. Such installations shall be permitted to be single conductors in approved raceways, single or multiconductor Type UF, Type NMC, Type MI, or other approved conductors.

**(B) Leads in Junction Box.** Not less than 150 mm (6 in.) of free nonheating lead shall be within the junction box. The marking of the leads shall be visible in the junction box.

**(C) Excess Leads.** Excess leads of heating cables shall not be cut but shall be secured to the underside of the ceiling and embedded in plaster or other approved material, leaving only a length sufficient to reach the junction box with not less than 150 mm (6 in.) of free lead within the box.

#### 424.44 Installation of Cables in Concrete or Poured Masonry Floors

**(A) Watts per Linear Meter (Foot).** Constant wattage heating cables shall not exceed 54 watts per linear meter (16½ watts per linear foot) of cable.

**(B) Spacing Between Adjacent Runs.** The spacing between adjacent runs of cable shall not be less than 25 mm (1 in.) on centers.

**(C) Secured in Place.** Cables shall be secured in place by nonmetallic frames or spreaders or other approved means while the concrete or other finish is applied.

Cables shall not be installed where they bridge expansion joints unless protected from expansion and contraction.

**(D) Spacings Between Heating Cable and Metal Embedded in the Floor.** Spacings shall be maintained between the heating cable and metal embedded in the floor, unless the cable is a grounded metal-clad cable.

**(E) Leads Protected.** Leads shall be protected where they leave the floor by rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, electrical metallic tubing, or by other approved means.

**(F) Bushings or Approved Fittings.** Bushings or approved fittings shall be used where the leads emerge within the floor slab.

**(G) Ground-Fault Circuit-Interrupter Protection.** Ground-fault circuit-interrupter protection for personnel shall be provided for cables installed in electrically heated floors of bathrooms, kitchens, and in hydromassage bathtub locations.

Section 424.44(G) requires the use of GFCI protection where cables are installed in concrete or poured masonry floors, thereby reducing shock hazards to persons with bare feet in these areas. This requirement applies regardless of the type of floor covering over the concrete or poured masonry. Electric radiant heating cables are permitted in bathroom floors and hydromassage bathtub locations, but, in accordance with 680.27(C)(3), they are not permitted in spa and hot tub locations.

#### 424.45 Inspection and Tests

Cable installations shall be made with due care to prevent damage to the cable assembly and shall be inspected and approved before cables are covered or concealed.

### VI. Duct Heaters

#### 424.57 General

Part VI shall apply to any heater mounted in the airstream of a forced-air system where the air-moving unit is not provided as an integral part of the equipment.

#### 424.58 Identification

Heaters installed in an air duct shall be identified as suitable for the installation.

**424.59 Airflow**

Means shall be provided to ensure uniform and adequate airflow over the face of the heater in accordance with the manufacturer's instructions.

Informational Note: Heaters installed within 1.2 m (4 ft) of the outlet of an air-moving device, heat pump, air conditioner, elbows, baffle plates, or other obstructions in ductwork may require turning vanes, pressure plates, or other devices on the inlet side of the duct heater to ensure an even distribution of air over the face of the heater.

**424.60 Elevated Inlet Temperature**

Duct heaters intended for use with elevated inlet air temperature shall be identified as suitable for use at the elevated temperatures.

**424.61 Installation of Duct Heaters with Heat Pumps and Air Conditioners**

Heat pumps and air conditioners having duct heaters closer than 1.2 m (4 ft) to the heat pump or air conditioner shall have both the duct heater and heat pump or air conditioner identified as suitable for such installation and so marked.

**424.62 Condensation**

Duct heaters used with air conditioners or other air-cooling equipment that could result in condensation of moisture shall be identified as suitable for use with air conditioners.

**424.63 Fan Circuit Interlock**

Means shall be provided to ensure that the fan circuit is energized when any heater circuit is energized. However, time- or temperature-controlled delay in energizing the fan motor shall be permitted.

**424.64 Limit Controls**

Each duct heater shall be provided with an approved, integral, automatic-reset temperature-limiting control or controllers to de-energize the circuit or circuits.

In addition, an integral independent supplementary control or controllers shall be provided in each duct heater that disconnects a sufficient number of conductors to interrupt current flow. This device shall be manually resettable or replaceable.

**424.65 Location of Disconnecting Means**

Duct heater controller equipment shall be either accessible with the disconnecting means installed at or within sight from the controller or as permitted by 424.19(A).

**424.66 Installation**

Duct heaters shall be installed in accordance with the manufacturer's instructions in such a manner that operation does

not create a hazard to persons or property. Furthermore, duct heaters shall be located with respect to building construction and other equipment so as to permit access to the heater. Sufficient clearance shall be maintained to permit replacement of controls and heating elements and for adjusting and cleaning of controls and other parts requiring such attention. See 110.26.

Informational Note: For additional installation information, see NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilating Systems*, and NFPA 90B-2009, *Standard for the Installation of Warm Air Heating and Air-Conditioning Systems*.

**VII. Resistance-Type Boilers****424.70 Scope**

The provisions in Part VII of this article shall apply to boilers employing resistance-type heating elements. Electrode-type boilers shall not be considered as employing resistance-type heating elements. See Part VIII of this article.

**424.71 Identification**

Resistance-type boilers shall be identified as suitable for the installation.

**424.72 Overcurrent Protection**

**(A) Boiler Employing Resistance-Type Immersion Heating Elements in an ASME-Rated and Stamped Vessel.** A boiler employing resistance-type immersion heating elements contained in an ASME-rated and stamped vessel shall have the heating elements protected at not more than 150 amperes. Such a boiler rated more than 120 amperes shall have the heating elements subdivided into loads not exceeding 120 amperes.

Where a subdivided load is less than 120 amperes, the rating of the overcurrent protective device shall comply with 424.3(B).

**(B) Boiler Employing Resistance-Type Heating Elements Rated More Than 48 Amperes and Not Contained in an ASME-Rated and Stamped Vessel.** A boiler employing resistance-type heating elements not contained in an ASME-rated and stamped vessel shall have the heating elements protected at not more than 60 amperes. Such a boiler rated more than 48 amperes shall have the heating elements subdivided into loads not exceeding 48 amperes.

Where a subdivided load is less than 48 amperes, the rating of the overcurrent protective device shall comply with 424.3(B).

See the commentary following 424.22(B) for an explanation of the subdivision requirement.

**(C) Supplementary Overcurrent Protective Devices.**

The supplementary overcurrent protective devices for the subdivided loads as required by 424.72(A) and (B) shall be as follows:

- (1) Factory-installed within or on the boiler enclosure or provided as a separate assembly by the boiler manufacturer
- (2) Accessible, but need not be readily accessible
- (3) Suitable for branch-circuit protection

Where cartridge fuses are used to provide this overcurrent protection, a single disconnecting means shall be permitted for the several subdivided circuits. See 240.40.

**(D) Conductors Supplying Supplementary Overcurrent Protective Devices.** The conductors supplying these supplementary overcurrent protective devices shall be considered branch-circuit conductors.

Where the heaters are rated 50 kW or more, the conductors supplying the overcurrent protective device specified in 424.72(C) shall be permitted to be sized at not less than 100 percent of the nameplate rating of the heater, provided all of the following conditions are met:

- (1) The heater is marked with a minimum conductor size.
- (2) The conductors are not smaller than the marked minimum size.
- (3) A temperature- or pressure-actuated device controls the cyclic operation of the equipment.

**(E) Conductors for Subdivided Loads.** Field-wired conductors between the heater and the supplementary overcurrent protective devices shall be sized at not less than 125 percent of the load served. The supplementary overcurrent protective devices specified in 424.72(C) shall protect these conductors in accordance with 240.4.

Where the heaters are rated 50 kW or more, the ampacity of field-wired conductors between the heater and the supplementary overcurrent protective devices shall be permitted to be not less than 100 percent of the load of their respective subdivided circuits, provided all of the following conditions are met:

- (1) The heater is marked with a minimum conductor size.
- (2) The conductors are not smaller than the marked minimum size.
- (3) A temperature-activated device controls the cyclic operation of the equipment.

**424.73 Overtemperature Limit Control**

Each boiler designed so that in normal operation there is no change in state of the heat transfer medium shall be equipped with a temperature-sensitive limiting means. It shall be installed to limit maximum liquid temperature and shall directly or indirectly disconnect all ungrounded conductors to

the heating elements. Such means shall be in addition to a temperature-regulating system and other devices protecting the tank against excessive pressure.

**424.74 Overpressure Limit Control**

Each boiler designed so that in normal operation there is a change in state of the heat transfer medium from liquid to vapor shall be equipped with a pressure-sensitive limiting means. It shall be installed to limit maximum pressure and shall directly or indirectly disconnect all ungrounded conductors to the heating elements. Such means shall be in addition to a pressure-regulating system and other devices protecting the tank against excessive pressure.

**VIII. Electrode-Type Boilers****424.80 Scope**

The provisions in Part VIII of this article shall apply to boilers for operation at 600 volts, nominal, or less, in which heat is generated by the passage of current between electrodes through the liquid being heated.

Informational Note: For over 600 volts, see Part V of Article 490.

**424.81 Identification**

Electrode-type boilers shall be identified as suitable for the installation.

**424.82 Branch-Circuit Requirements**

The size of branch-circuit conductors and overcurrent protective devices shall be calculated on the basis of 125 percent of the total load (motors not included). A contactor, relay, or other device, approved for continuous operation at 100 percent of its rating, shall be permitted to supply its full-rated load. See 210.19(A), Exception. The provisions of this section shall not apply to conductors that form an integral part of an approved boiler.

Where an electrode boiler is rated 50 kW or more, the conductors supplying the boiler electrode(s) shall be permitted to be sized at not less than 100 percent of the nameplate rating of the electrode boiler, provided all the following conditions are met:

- (1) The electrode boiler is marked with a minimum conductor size.
- (2) The conductors are not smaller than the marked minimum size.
- (3) A temperature- or pressure-actuated device controls the cyclic operation of the equipment.

**424.83 Overtemperature Limit Control**

Each boiler, designed so that in normal operation there is no change in state of the heat transfer medium, shall be equipped with a temperature-sensitive limiting means. It

shall be installed to limit maximum liquid temperature and shall directly or indirectly interrupt all current flow through the electrodes. Such means shall be in addition to the temperature-regulating system and other devices protecting the tank against excessive pressure.

#### 424.84 Overpressure Limit Control

Each boiler, designed so that in normal operation there is a change in state of the heat transfer medium from liquid to vapor, shall be equipped with a pressure-sensitive limiting means. It shall be installed to limit maximum pressure and shall directly or indirectly interrupt all current flow through the electrodes. Such means shall be in addition to a pressure-regulating system and other devices protecting the tank against excessive pressure.

#### 424.85 Grounding

For those boilers designed such that fault currents do not pass through the pressure vessel, and the pressure vessel is electrically isolated from the electrodes, all exposed non-current-carrying metal parts, including the pressure vessel, supply, and return connecting piping, shall be grounded.

For all other designs, the pressure vessel containing the electrodes shall be isolated and electrically insulated from ground.

#### 424.86 Markings

All electrode-type boilers shall be marked to show the following:

- (1) The manufacturer's name
- (2) The normal rating in volts, amperes, and kilowatts
- (3) The electrical supply required specifying frequency, number of phases, and number of wires
- (4) The marking "Electrode-Type Boiler"
- (5) A warning marking, "All Power Supplies Shall Be Disconnected Before Servicing, Including Servicing the Pressure Vessel"

The nameplate shall be located so as to be visible after installation.

### IX. Electric Radiant Heating Panels and Heating Panel Sets

#### 424.90 Scope

The provisions of Part IX of this article shall apply to radiant heating panels and heating panel sets.

#### 424.91 Definitions

**Heating Panel.** A complete assembly provided with a junction box or a length of flexible conduit for connection to a branch circuit.

**Heating Panel Set.** A rigid or nonrigid assembly provided with nonheating leads or a terminal junction assembly identified as being suitable for connection to a wiring system.

#### 424.92 Markings

(A) **Location.** Markings shall be permanent and in a location that is visible prior to application of panel finish.

(B) **Identified as Suitable.** Each unit shall be identified as suitable for the installation.

(C) **Required Markings.** Each unit shall be marked with the identifying name or identification symbol, catalog number, and rating in volts and watts or in volts and amperes.

(D) **Labels Provided by Manufacturer.** The manufacturers of heating panels or heating panel sets shall provide marking labels that indicate that the space-heating installation incorporates heating panels or heating panel sets and instructions that the labels shall be affixed to the panelboards to identify which branch circuits supply the circuits to those space-heating installations. If the heating panels and heating panel set installations are visible and distinguishable after installation, the labels shall not be required to be provided and affixed to the panelboards.

#### 424.93 Installation

(A) **General.**

(1) **Manufacturer's Instructions.** Heating panels and heating panel sets shall be installed in accordance with the manufacturer's instructions.

(2) **Locations Not Permitted.** The heating portion shall not be installed as follows:

- (1) In or behind surfaces where subject to physical damage
- (2) Run through or above walls, partitions, cupboards, or similar portions of structures that extend to the ceiling
- (3) Run in or through thermal insulation, but shall be permitted to be in contact with the surface of thermal insulation

(3) **Separation from Outlets for Luminaires.** Edges of panels and panel sets shall be separated by not less than 200 mm (8 in.) from the edges of any outlet boxes and junction boxes that are to be used for mounting surface luminaires. A clearance of not less than 50 mm (2 in.) shall be provided from recessed luminaires and their trims, ventilating openings, and other such openings in room surfaces, unless the heating panels and panel sets are listed and marked for lesser clearances, in which case they shall be permitted to be installed at the marked clearances. Sufficient area shall be provided to ensure that no heating panel or heating panel set is to be covered by any surface-mounted units.

**(4) Surfaces Covering Heating Panels.** After the heating panels or heating panel sets are installed and inspected, it shall be permitted to install a surface that has been identified by the manufacturer's instructions as being suitable for the installation. The surface shall be secured so that the nails or other fastenings do not pierce the heating panels or heating panel sets.

**(5) Surface Coverings.** Surfaces permitted by 424.93(A)(4) shall be permitted to be covered with paint, wallpaper, or other approved surfaces identified in the manufacturer's instructions as being suitable.

**(B) Heating Panel Sets.**

**(1) Mounting Location.** Heating panel sets shall be permitted to be secured to the lower face of joists or mounted in between joists, headers, or nailing strips.

**(2) Parallel to Joists or Nailing Strips.** Heating panel sets shall be installed parallel to joists or nailing strips.

**(3) Installation of Nails, Staples, or Other Fasteners.** Nailing or stapling of heating panel sets shall be done only through the unheated portions provided for this purpose. Heating panel sets shall not be cut through or nailed through any point closer than 6 mm (¼ in.) to the element. Nails, staples, or other fasteners shall not be used where they penetrate current-carrying parts.

**(4) Installed as Complete Unit.** Heating panel sets shall be installed as complete units unless identified as suitable for field cutting in an approved manner.

**424.94 Clearances of Wiring in Ceilings**

Wiring located above heated ceilings shall be spaced not less than 50 mm (2 in.) above the heated ceiling and shall be considered as operating at an ambient of 50°C (122°F). The ampacity shall be calculated on the basis of the correction factors given in the 0–2000 volt ampacity tables of Article 310. If this wiring is located above thermal insulations having a minimum thickness of 50 mm (2 in.), the wiring shall not require correction for temperature.

**424.95 Location of Branch-Circuit and Feeder Wiring in Walls**

**(A) Exterior Walls.** Wiring methods shall comply with Article 300 and 310.15(A)(3).

**(B) Interior Walls.** Any wiring behind heating panels or heating panel sets located in interior walls or partitions shall be considered as operating at an ambient temperature of 40°C (104°F), and the ampacity shall be calculated on the

basis of the correction factors given in the 0–2000 volt ampacity tables of Article 310.

**424.96 Connection to Branch-Circuit Conductors**

**(A) General.** Heating panels or heating panel sets assembled together in the field to form a heating installation in one room or area shall be connected in accordance with the manufacturer's instructions.

**(B) Heating Panels.** Heating panels shall be connected to branch-circuit wiring by an approved wiring method.

**(C) Heating Panel Sets.**

**(1) Connection to Branch-Circuit Wiring.** Heating panel sets shall be connected to branch-circuit wiring by a method identified as being suitable for the purpose.

**(2) Panel Sets with Terminal Junction Assembly.** A heating panel set provided with terminal junction assembly shall be permitted to have the nonheating leads attached at the time of installation in accordance with the manufacturer's instructions.

**424.97 Nonheating Leads**

Excess nonheating leads of heating panels or heating panel sets shall be permitted to be cut to the required length. They shall meet the installation requirements of the wiring method employed in accordance with 424.96. Nonheating leads shall be an integral part of a heating panel and a heating panel set and shall not be subjected to the ampacity requirements of 424.3(B) for branch circuits.

**424.98 Installation in Concrete or Poured Masonry**

**(A) Maximum Heated Area.** Heating panels or heating panel sets shall not exceed 355 watts/m<sup>2</sup> (33 watts/ft<sup>2</sup>) of heated area.

**(B) Secured in Place and Identified as Suitable.** Heating panels or heating panel sets shall be secured in place by means specified in the manufacturer's instructions and identified as suitable for the installation.

**(C) Expansion Joints.** Heating panels or heating panel sets shall not be installed where they bridge expansion joints unless provision is made for expansion and contraction.

**(D) Spacings.** Spacings shall be maintained between heating panels or heating panel sets and metal embedded in the floor. Grounded metal-clad heating panels shall be permitted to be in contact with metal embedded in the floor.

**(E) Protection of Leads.** Leads shall be protected where they leave the floor by rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing, or by other approved means.

**(F) Bushings or Fittings Required.** Bushings or approved fittings shall be used where the leads emerge within the floor slabs.

### 424.99 Installation Under Floor Covering

**(A) Identification.** Heating panels or heating panel sets for installation under floor covering shall be identified as suitable for installation under floor covering.

**(B) Maximum Heated Area.** Heating panels or panel sets installed under floor covering shall not exceed 160 watts/m<sup>2</sup> (15 watts/ft<sup>2</sup>) of heated area.

**(C) Installation.** Listed heating panels or panel sets, if installed under floor covering, shall be installed on floor surfaces that are smooth and flat in accordance with the manufacturer's instructions and shall also comply with 424.99(C)(1) through (C)(5).

**(1) Expansion Joints.** Heating panels or heating panel sets shall not be installed where they bridge expansion joints unless protected from expansion and contraction.

**(2) Connection to Conductors.** Heating panels and heating panel sets shall be connected to branch-circuit and supply wiring by wiring methods recognized in Chapter 3.

**(3) Anchoring.** Heating panels and heating panel sets shall be firmly anchored to the floor using an adhesive or anchoring system identified for this use.

**(4) Coverings.** After heating panels or heating panel sets are installed and inspected, they shall be permitted to be covered by a floor covering that has been identified by the manufacturer as being suitable for the installation. The covering shall be secured to the heating panel or heating panel sets with release-type adhesives or by means identified for this use.

**(5) Fault Protection.** A device to open all ungrounded conductors supplying the heating panels or heating panel sets, provided by the manufacturer, shall function when a low- or high-resistance line-to-line, line-to-grounded conductor, or line-to-ground fault occurs, such as the result of a penetration of the element or element assembly.

Informational Note: An integral grounding shield may be required to provide this protection.

A system that uses conductive-film heating elements is an example of a heating system that could be installed under a floor covering.

## I. General

### 426.1 Scope

The requirements of this article shall apply to electrically energized heating systems and the installation of these systems.

**(A) Embedded.** Embedded in driveways, walks, Steps, and other areas.

**(B) Exposed.** Exposed on drainage systems, bridge structures, roofs, and other structures.

Article 426 includes requirements for resistance heating elements, impedance heating systems, or skin-effect heating systems used for deicing and snow melting. These systems are defined in 426.2.

### 426.2 Definitions

**Heating System.** A complete system consisting of components such as heating elements, fastening devices, nonheat-

ing circuit wiring, leads, temperature controllers, safety signs, junction boxes, raceways, and fittings.

**Impedance Heating System.** A system in which heat is generated in a pipe or rod, or combination of pipes and rods, by causing current to flow through the pipe or rod by direct connection to an ac voltage source from an isolating transformer. The pipe or rod shall be permitted to be embedded in the surface to be heated, or constitute the exposed components to be heated.

**Resistance Heating Element.** A specific separate element to generate heat that is embedded in or fastened to the surface to be heated.

Informational Note: Tubular heaters, strip heaters, heating cable, heating tape, and heating panels are examples of resistance heaters.

**Skin-Effect Heating System.** A system in which heat is generated on the inner surface of a ferromagnetic envelope embedded in or fastened to the surface to be heated.

Informational Note: Typically, an electrically insulated conductor is routed through and connected to the envelope at the other end. The envelope and the electrically insulated conductor are connected to an ac voltage source from an isolating transformer.

## 426.3 Application of Other Articles

Cord-and-plug-connected fixed outdoor electric deicing and snow-melting equipment intended for specific use and identified as suitable for this use shall be installed according to Article 422.

### 426.4 Continuous Load

Fixed outdoor electric deicing and snow-melting equipment shall be considered as a continuous load.

Fixed outdoor electric deicing and snow-melting equipment can operate over 3 hours, so it must be considered a continuous load when sizing branch circuits, feeders, service conductors, and overcurrent protective devices.

## II. Installation

### 426.10 General

Equipment for outdoor electric deicing and snow melting shall be identified as being suitable for the following:

- (1) The chemical, thermal, and physical environment
- (2) Installation in accordance with the manufacturer's drawings and instructions

### 426.11 Use

Electric heating equipment shall be installed in such a manner as to be afforded protection from physical damage.

Underwriters Laboratories Inc. requires that manufacturers of UL-listed mat or cable deicing and snow-melting equipment provide specific installation instructions for their products. These instructions supplement the requirements contained in Article 426. For example, if the equipment can be installed only in concrete that is double poured (poured in two parts), the installation instructions are to specifically require that installation technique. Where the instructions do not specifically require that a double-pour installation process be used, it is acceptable to use either a single- or double-pour method of installation. See 110.3(B) regarding the installation and use of listed or labeled equipment.

### 426.12 Thermal Protection

External surfaces of outdoor electric deicing and snow-melting equipment that operate at temperatures exceeding 60°C (140°F) shall be physically guarded, isolated, or thermally insulated to protect against contact by personnel in the area.

### 426.13 Identification

The presence of outdoor electric deicing and snow-melting equipment shall be evident by the posting of appropriate caution signs or markings where clearly visible.

### 426.14 Special Permission

Fixed outdoor deicing and snow-melting equipment employing methods of construction or installation other than covered by this article shall be permitted only by special permission.

See the definition of *special permission* in Article 100.

## III. Resistance Heating Elements

### 426.20 Embedded Deicing and Snow-Melting Equipment

**(A) Watt Density.** Panels or units shall not exceed 1300 watts/m<sup>2</sup> (120 watts/ft<sup>2</sup>) of heated area.

**(B) Spacing.** The spacing between adjacent cable runs is dependent upon the rating of the cable and shall be not less than 25 mm (1 in.) on centers.

**(C) Cover.** Units, panels, or cables shall be installed as follows:

- (1) On a substantial asphalt or masonry base at least 50 mm (2 in.) thick and have at least 38 mm (1½ in.) of asphalt or masonry applied over the units, panels, or cables; or
- (2) They shall be permitted to be installed over other approved bases and embedded within 90 mm (3½ in.) of

masonry or asphalt but not less than 38 mm (1½ in.) from the top surface; or

- (3) Equipment that has been **listed** for other forms of installation shall be installed only in the manner for which it has been **identified**.

**(D) Secured.** Cables, units, and panels shall be secured in place by frames or spreaders or other approved means while the masonry or asphalt finish is applied.

**(E) Expansion and Contraction.** Cables, units, and panels shall not be installed where they bridge expansion joints unless provision is made for expansion and contraction.

### 426.21 Exposed Deicing and Snow-Melting Equipment

**(A) Secured.** Heating element assemblies shall be secured to the surface being heated by approved means.

**(B) Overtemperature.** Where the heating element is not in direct contact with the surface being heated, the design of the heater assembly shall be such that its temperature limitations shall not be exceeded.

**(C) Expansion and Contraction.** Heating elements and assemblies shall not be installed where they bridge expansion joints unless provision is made for expansion and contraction.

**(D) Flexural Capability.** Where installed on flexible structures, the heating elements and assemblies shall have a flexural capability that is compatible with the structure.

### 426.22 Installation of Nonheating Leads for Embedded Equipment

**(A) Grounding Sheath or Braid.** Nonheating leads having a grounding sheath or braid shall be permitted to be embedded in the masonry or asphalt in the same manner as the heating cable without additional physical protection.

**(B) Raceways.** All but 25 mm to 150 mm (1 in. to 6 in.) of nonheating **leads** not having a grounding sheath shall be enclosed in a rigid **metal** conduit, electrical metallic tubing, intermediate metal conduit, or other raceways within asphalt or masonry. The distance from the factory splice to raceway shall not be less than 25 mm (1 in.) or more than 150 mm (6 in.).

**(C) Bushings.** Insulating bushings shall be used in the asphalt or masonry where leads enter conduit or tubing.

See 300.4(G) and the associated commentary for further information regarding insulating bushings.

**(D) Expansion and Contraction.** Leads shall be protected in expansion joints and where they emerge from masonry or asphalt by rigid conduit, electrical metallic tubing, intermediate metal conduit, other raceways, or other approved means.

**(E) Leads in Junction Boxes.** Not less than 150 mm (6 in.) of free nonheating lead shall be within the junction box.

#### 426.23 Installation of Nonheating Leads for Exposed Equipment

**(A) Nonheating Leads.** Power supply nonheating leads (cold leads) for resistance elements shall be identified for the temperature encountered. Not less than 150 mm (6 in.) of nonheating leads shall be provided within the junction box. Preassembled factory-supplied and field-assembled nonheating leads on approved heaters shall be permitted to be shortened if the markings specified in 426.25 are retained.

**(B) Protection.** Nonheating power supply leads shall be enclosed in a rigid conduit, intermediate metal conduit, electrical metallic tubing, or other approved means.

#### 426.24 Electrical Connection

**(A) Heating Element Connections.** Electrical connections, other than factory connections of heating elements to nonheating elements embedded in masonry or asphalt or on exposed surfaces, shall be made with insulated connectors identified for the use.

**(B) Circuit Connections.** Splices and terminations at the end of the nonheating leads, other than the heating element end, shall be installed in a box or fitting in accordance with 110.14 and 300.15.

#### 426.25 Marking

Each factory-assembled heating unit shall be legibly marked within 75 mm (3 in.) of each end of the nonheating leads with the permanent identification symbol, catalog number, and ratings in volts and watts or in volts and amperes.

#### 426.26 Corrosion Protection

Ferrous and nonferrous metal raceways, cable armor, cable sheaths, boxes, fittings, supports, and support hardware shall be permitted to be installed in concrete or in direct contact with the earth, or in areas subject to severe corrosive influences, where made of material suitable for the condition, or where provided with corrosion protection identified as suitable for the condition.

#### 426.27 Grounding Braid or Sheath

Grounding means, such as copper braid, metal sheath, or other approved means, shall be provided as part of the heated section of the cable, panel, or unit.

#### 426.28 Ground-Fault Protection of Equipment

Ground-fault protection of equipment shall be provided for fixed outdoor electric deicing and snow-melting equipment.

Rather than protecting the entire branch circuit, the ground-fault protection requirement is focused on protecting just the equipment itself. This rule affords the manufacturer and the user an option of providing both circuit and equipment protection or just the required equipment protection. This required protection for fixed outdoor deicing and snow-melting equipment may be accomplished by using circuit breakers equipped with ground-fault equipment protection (GFEP) or an integral device supplied as part of the deicing or snow-melting equipment that is sensitive to leakage currents in the magnitude of 6 mA to 50 mA. These protection devices, if applied properly, will substantially reduce the risk of a fire being started by low-level electrical arcing.

Note that the required equipment protection is not the same as a GFCI used for personal protection that trips at 5 mA ( $\pm 1$  mA).

### IV. Impedance Heating

#### 426.30 Personnel Protection

Exposed elements of impedance heating systems shall be physically guarded, isolated, or thermally insulated with a weatherproof jacket to protect against contact by personnel in the area.

#### 426.31 Isolation Transformer

An isolation transformer with a grounded shield between the primary and secondary windings shall be used to isolate the distribution system from the heating system.

#### 426.32 Voltage Limitations

Unless protected by ground-fault circuit-interrupter protection for personnel, the secondary winding of the isolation transformer connected to the impedance heating elements shall not have an output voltage greater than 30 volts ac.

Where ground-fault circuit-interrupter protection for personnel is provided, the voltage shall be permitted to be greater than 30 but not more than 80 volts.

#### 426.33 Induced Currents

All current-carrying components shall be installed in accordance with 300.20.

### 426.34 Grounding

An impedance heating system that is operating at a voltage greater than 30 but not more than 80 shall be grounded at a designated point(s).

## V. Skin-Effect Heating

### 426.40 Conductor Ampacity

The current through the electrically insulated conductor inside the ferromagnetic envelope shall be permitted to exceed the ampacity values shown in Article 310, provided it is identified as suitable for this use.

### 426.41 Pull Boxes

Where pull boxes are used, they shall be accessible without excavation by location in suitable vaults or abovegrade. Outdoor pull boxes shall be of watertight construction.

### 426.42 Single Conductor in Enclosure

The provisions of 300.20 shall not apply to the installation of a single conductor in a ferromagnetic envelope (metal enclosure).

### 426.43 Corrosion Protection

Ferromagnetic envelopes, ferrous or nonferrous metal raceways, boxes, fittings, supports, and support hardware shall be permitted to be installed in concrete or in direct contact with the earth, or in areas subjected to severe corrosive influences, where made of material suitable for the condition, or where provided with corrosion protection identified as suitable for the condition. Corrosion protection shall maintain the original wall thickness of the ferromagnetic envelope.

### 426.44 Grounding

The ferromagnetic envelope shall be connected to an equipment grounding conductor at both ends; and, in addition, it shall be permitted to be connected to an equipment grounding conductor at intermediate points as required by its design.

The provisions of 250.30 shall not apply to the installation of skin-effect heating systems.

Informational Note: For grounding methods, see Article 250.

## VI. Control and Protection

### 426.50 Disconnecting Means

**(A) Disconnection.** All fixed outdoor deicing and snow-melting equipment shall be provided with a means for simultaneous disconnection from all ungrounded conductors. Where readily accessible to the user of the equipment, the branch-circuit switch or circuit breaker shall be permitted to

serve as the disconnecting means. The disconnecting means shall be of the indicating type and be provided with a positive lockout in the “off” position.

Section 426.50(A) requires that the disconnecting means simultaneously open all ungrounded conductors to prevent the practice of disconnecting one conductor at a time at terminal blocks or similar devices. In addition, the disconnect must indicate when it is in the “on” or “off” position, and a means must be provided for locking the disconnect in the “off” position. The disconnecting means is allowed to be the branch circuit switch or circuit breaker where it is “readily accessible”; in that case, it must have a means for a positive lockout in the “off” position.

**(B) Cord-and-Plug-Connected Equipment.** The factory-installed attachment plug of cord-and-plug-connected equipment rated 20 amperes or less and 150 volts or less to ground shall be permitted to be the disconnecting means.

### 426.51 Controllers

**(A) Temperature Controller with “Off” Position.** Temperature controlled switching devices that indicate an “off” position and that interrupt line current shall open all ungrounded conductors when the control device is in the “off” position. These devices shall not be permitted to serve as the disconnecting means unless capable of being locked in the open position.

**(B) Temperature Controller Without “Off” Position.** Temperature controlled switching devices that do not have an “off” position shall not be required to open all ungrounded conductors and shall not be permitted to serve as the disconnecting means.

**(C) Remote Temperature Controller.** Remote controlled temperature-actuated devices shall not be required to meet the requirements of 426.51(A). These devices shall not be permitted to serve as the disconnecting means.

**(D) Combined Switching Devices.** Switching devices consisting of combined temperature-actuated devices and manually controlled switches that serve both as the controller and the disconnecting means shall comply with all of the following conditions:

- (1) Open all ungrounded conductors when manually placed in the “off” position
- (2) Be so designed that the circuit cannot be energized automatically if the device has been manually placed in the “off” position
- (3) Be capable of being locked in the open position

### 426.54 Cord-and-Plug-Connected Deicing and Snow-Melting Equipment

Cord-and-plug-connected deicing and snow-melting equipment shall be listed.

According to the *UL Guide Information for Electrical Equipment — The White Book*-2010 edition, category KOBQ, UL-listed deicing and snow-melting equipment is provided with means for permanent wiring connection, except the equipment rated 20 amperes or less and 150 volts or less to ground may be of cord-and-plug-connected construction. See the definition of *listed* in Article 100.

### I. General

#### 427.1 Scope

The requirements of this article shall apply to electrically energized heating systems and the installation of these systems used with pipelines or vessels or both.

Article 427 includes requirements for impedance heating, induction heating, and skin-effect heating, in addition to resistance heating elements. Definitions of the various systems are provided in 427.2.

Informational Note: For further information, see ANSI/IEEE Std. 515-2002, *Standard for the Testing, Design, Installation and Maintenance of Electrical Resistance Heat Tracing for Industrial Applications*; ANSI/IEEE Std. 844-2000, *Recommended Practice for Electrical Impedance, Induction, and Skin Effect Heating of Pipelines and Vessels*; and ANSI/NECA 202-2001, *Recommended Practice for Installing and Maintaining Industrial Heat Tracing Systems*.

#### 427.2 Definitions

**Impedance Heating System.** A system in which heat is generated in a pipeline or vessel wall by causing current to flow through the pipeline or vessel wall by direct connection to an ac voltage source from a dual-winding transformer.

**Induction Heating System.** A system in which heat is generated in a pipeline or vessel wall by inducing current and hysteresis effect in the pipeline or vessel wall from an external isolated ac field source.

**Integrated Heating System.** A complete system consisting of components such as pipelines, vessels, heating elements, heat transfer medium, thermal insulation, moisture barrier, nonheating leads, temperature controllers, safety signs, junction boxes, raceways, and fittings.

**Pipeline.** A length of pipe including pumps, valves, flanges, control devices, strainers, and/or similar equipment for conveying fluids.

**Resistance Heating Element.** A specific separate element to generate heat that is applied to the pipeline or vessel externally or internally.

Informational Note: Tubular heaters, strip heaters, heating cable, heating tape, heating blankets, and immersion heaters are examples of resistance heaters.

**Skin-Effect Heating System.** A system in which heat is generated on the inner surface of a ferromagnetic envelope attached to a pipeline or vessel, or both.

Informational Note: Typically, an electrically insulated conductor is routed through and connected to the envelope at the other end. The envelope and the electrically insulated conductor are connected to an ac voltage source from a dual-winding transformer.

**Vessel.** A container such as a barrel, drum, or tank for holding fluids or other material.

### 427.3 Application of Other Articles

Cord-connected pipe heating assemblies intended for specific use and identified as suitable for this use shall be installed according to Article 422.

### 427.4 Continuous Load

Fixed electric heating equipment for pipelines and vessels shall be considered continuous load.

The requirement in 427.4 eliminates any question about whether the heating equipment is a continuous load, as defined in Article 100.

## II. Installation

### 427.10 General

Equipment for pipeline and vessel electric heating shall be identified as being suitable for (1) the chemical, thermal, and physical environment and (2) installation in accordance with the manufacturer's drawings and instructions.

### 427.11 Use

Electric heating equipment shall be installed in such a manner as to be afforded protection from physical damage.

### 427.12 Thermal Protection

External surfaces of pipeline and vessel heating equipment that operate at temperatures exceeding 60°C (140°F) shall be physically guarded, isolated, or thermally insulated to protect against contact by personnel in the area.

### 427.13 Identification

The presence of electrically heated pipelines, vessels, or both, shall be evident by the posting of appropriate caution signs or markings at intervals not exceeding 6 m (20 ft) along the pipeline or vessel and on or adjacent to equipment in the piping system that requires periodic servicing.

## III. Resistance Heating Elements

### 427.14 Secured

Heating element assemblies shall be secured to the surface being heated by means other than the thermal insulation.

### 427.15 Not in Direct Contact

Where the heating element is not in direct contact with the pipeline or vessel being heated, means shall be provided to prevent overtemperature of the heating element unless the design of the heater assembly is such that its temperature limitations will not be exceeded.

### 427.16 Expansion and Contraction

Heating elements and assemblies shall not be installed where they bridge expansion joints unless provisions are made for expansion and contraction.

### 427.17 Flexural Capability

Where installed on flexible pipelines, the heating elements and assemblies shall have a flexural capability that is compatible with the pipeline.

### 427.18 Power Supply Leads

**(A) Nonheating Leads.** Power supply nonheating leads (cold leads) for resistance elements shall be suitable for the temperature encountered. Not less than 150 mm (6 in.) of nonheating leads shall be provided within the junction box. Preassembled factory-supplied and field-assembled nonheating leads on approved heaters shall be permitted to be shortened if the markings specified in 427.20 are retained.

**(B) Power Supply Leads Protection.** Nonheating power supply leads shall be protected where they emerge from electrically heated pipeline or vessel heating units by rigid metal conduit, intermediate metal conduit, electrical metallic

tubing, or other raceways identified as suitable for the application.

**(C) Interconnecting Leads.** Interconnecting nonheating leads connecting portions of the heating system shall be permitted to be covered by thermal insulation in the same manner as the heaters.

#### 427.19 Electrical Connections

**(A) Nonheating Interconnections.** Nonheating interconnections, where required under thermal insulation, shall be made with insulated connectors identified as suitable for this use.

**(B) Circuit Connections.** Splices and terminations outside the thermal insulation shall be installed in a box or fitting in accordance with 110.14 and 300.15.

#### 427.20 Marking

Each factory-assembled heating unit shall be legibly marked within 75 mm (3 in.) of each end of the nonheating leads with the permanent identification symbol, catalog number, and ratings in volts and watts or in volts and amperes.

#### 427.22 Ground-Fault Protection of Equipment

Ground-fault protection of equipment shall be provided for electric heat tracing and heating panels. This requirement shall not apply in industrial establishments where there is alarm indication of ground faults and the following conditions apply:

- (1) Conditions of maintenance and supervision ensure that only qualified persons service the installed systems.
- (2) Continued circuit operation is necessary for safe operation of equipment or processes.

Section 427.22 requires that electric heat tracing and heating panels have ground-fault protection for equipment except in industrial establishments where an alarm indication of a ground fault is provided and the two conditions of 427.22 are met.

Rather than protecting the entire branch circuit, the ground-fault protection requirement is focused on protecting just the equipment itself. Such protection affords the manufacturer and the user the option of providing both circuit and equipment protection or just the required equipment protection. This required protection may be accomplished by using circuit breakers equipped with ground-fault equipment protection (GFEP) or an integral device supplied as part of the pipeline or vessel heating equipment that is sensitive to leakage currents in the magnitude of 6 mA to 50 mA. These protective devices, if applied properly, substantially reduce the risk of fire being started by low-level electrical arcing.

Note that that the required equipment protection is not the same as that provided by a GFCI used for personal protection that trips at 5 mA ( $\pm 1$  mA).

#### 427.23 Grounded Conductive Covering

Electric heating equipment shall be listed and have a grounded conductive covering in accordance with 427.23(A) or (B). The conductive covering shall provide an effective ground path for equipment protection.

Section 427.23 requires a listed grounded conductive covering on all heaters. This grounded conductive covering is intended to provide a ground-fault current path in order to trip circuit or ground-fault protective devices, thus reducing the potential for fire and electric shock. It also provides added mechanical protection of the heating cable or panel.

**(A) Heating Wires or Cables.** Heating wires or cables shall have a grounded conductive covering that surrounds the heating element and bus wires, if any, and their electrical insulation.

**(B) Heating Panels.** Heating panels shall have a grounded conductive covering over the heating element and its electrical insulation on the side opposite the side attached to the surface to be heated.

### IV. Impedance Heating

#### 427.25 Personnel Protection

All accessible external surfaces of the pipeline, vessel, or both, being heated shall be physically guarded, isolated, or thermally insulated (with a weatherproof jacket for outside installations) to protect against contact by personnel in the area.

#### 427.26 Isolation Transformer

A dual-winding transformer with a grounded shield between the primary and secondary windings shall be used to isolate the distribution system from the heating system.

#### 427.27 Voltage Limitations

Unless protected by ground-fault circuit-interrupter protection for personnel, the secondary winding of the isolation transformer connected to the pipeline or vessel being heated shall not have an output voltage greater than 30 volts ac.

Where ground-fault circuit-interrupter protection for personnel is provided, the voltage shall be permitted to be greater than 30 but not more than 80 volts.

*Exception: In industrial establishments, the isolation transformer connected to the pipeline or vessel being heated*

*shall be permitted to have an output voltage not greater than 132 volts ac to ground where all of the following conditions apply:*

- (1) *Conditions of maintenance and supervision ensure that only qualified persons service the installed systems.*
- (2) *Ground-fault protection of equipment is provided.*
- (3) *The pipeline or vessel being heated is completely enclosed in a grounded metal enclosure.*
- (4) *The transformer secondary connections to the pipeline or vessel being heated are completely enclosed in a grounded metal mesh or metal enclosure.*

The exception to 427.27 allows a voltage of not more than 132 volts for impedance heating where installed in industrial establishments, provided four prerequisites are followed. For other than industrial establishments, the maximum operating voltage allowed is 30 volts ac; where GFCI protection is used, a maximum of 80 volts ac is permitted.

#### 427.28 Induced Currents

All current-carrying components shall be installed in accordance with 300.20.

#### 427.29 Grounding

The pipeline, vessel, or both, that is being heated and operating at a voltage greater than 30 but not more than 80 shall be grounded at designated points.

#### 427.30 Secondary Conductor Sizing

The ampacity of the conductors connected to the secondary of the transformer shall be at least 100 percent of the total load of the heater.

### V. Induction Heating

#### 427.35 Scope

This part covers the installation of line frequency induction heating equipment and accessories for pipelines and vessels.

Informational Note: See Article 665 for other applications.

#### 427.36 Personnel Protection

Induction coils that operate or may operate at a voltage greater than 30 volts ac shall be enclosed in a nonmetallic or split metallic enclosure, isolated, or made inaccessible by location to protect personnel in the area.

#### 427.37 Induced Current

Induction coils shall be prevented from inducing circulating currents in surrounding metallic equipment, supports, or structures by shielding, isolation, or insulation of the current paths. Stray current paths shall be bonded to prevent arcing.

### VI. Skin-Effect Heating

#### 427.45 Conductor Ampacity

The ampacity of the electrically insulated conductor inside the ferromagnetic envelope shall be permitted to exceed the values given in Article 310, provided it is identified as suitable for this use.

#### 427.46 Pull Boxes

Pull boxes for pulling the electrically insulated conductor in the ferromagnetic envelope shall be permitted to be buried under the thermal insulation, provided their locations are indicated by permanent markings on the insulation jacket surface and on drawings. For outdoor installations, pull boxes shall be of watertight construction.

#### 427.47 Single Conductor in Enclosure

The provisions of 300.20 shall not apply to the installation of a single conductor in a ferromagnetic envelope (metal enclosure).

#### 427.48 Grounding

The ferromagnetic envelope shall be grounded at both ends, and, in addition, it shall be permitted to be grounded at intermediate points as required by its design. The ferromagnetic envelope shall be bonded at all joints to ensure electrical continuity.

The provisions of 250.30 shall not apply to the installation of skin-effect heating systems.

Informational Note: See Article 250 for grounding methods.

### VII. Control and Protection

#### 427.55 Disconnecting Means

(A) **Switch or Circuit Breaker.** Means shall be provided to simultaneously disconnect all fixed electric pipeline or vessel heating equipment from all ungrounded conductors. The branch-circuit switch or circuit breaker, where readily accessible to the user of the equipment, shall be permitted to serve as the disconnecting means. The disconnecting means shall be of the indicating type and shall be provided with a positive lockout in the “off” position.

The requirement in 427.55(A) that the disconnecting means simultaneously open all the ungrounded conductors is intended to prevent the practice of disconnecting one conductor at a time at terminal blocks or similar devices.

(B) **Cord-and-Plug-Connected Equipment.** The factory-installed attachment plug of cord-and-plug-connected equipment rated 20 amperes or less and 150 volts or less to ground shall be permitted to be the disconnecting means.

**427.56 Controls****(A) Temperature Control with “Off” Position.**

Temperature-controlled switching devices that indicate an “off” position and that interrupt line current shall open all ungrounded conductors when the control device is in this “off” position. These devices shall not be permitted to serve as the disconnecting means unless capable of being locked in the open position.

**(B) Temperature Control Without “Off” Position.**

Temperature controlled switching devices that do not have an “off” position shall not be required to open all ungrounded conductors and shall not be permitted to serve as the disconnecting means.

**(C) Remote Temperature Controller.** Remote controlled temperature-actuated devices shall not be required to meet the requirements of 427.56(A) and (B). These devices shall not be permitted to serve as the disconnecting means.

**(D) Combined Switching Devices.** Switching devices consisting of combined temperature-actuated devices and manually controlled switches that serve both as the controllers and the disconnecting means shall comply with all the following conditions:

- (1) Open all ungrounded conductors when manually placed in the “off” position
- (2) Be designed so that the circuit cannot be energized automatically if the device has been manually placed in the “off” position
- (3) Be capable of being locked in the open position

**427.57 Overcurrent Protection**

Heating equipment shall be considered as protected against overcurrent where supplied by a branch circuit as specified in 210.3 and 210.23.

## I. General

Most electrical equipment is rated in volt-amperes (VA) or watt input. Basic to the understanding of Article 430 is the fact that motors traditionally have been rated in horsepower output. Circuits supplying motors are sized according to the input to the motor. The input includes the motor losses and the power factor of the motor. The losses are not the type of information found on the nameplate of a motor. Tables 430.249 and 430.250 contain accurate industrywide input ampere ratings for motors.

Some motors are available with their output ratings expressed in watts and kilowatts. (One horsepower equals approximately 746 watts.) Circuits that supply motors not rated in horsepower still must be sized according to the input of the motor, rated in amperes. Sizing circuits based solely on kilowatt output results in seriously undersized conductors (because the current requirements of the losses and the power factor are neglected) and the improper application of overcurrent devices. See 430.6 for ampacity and motor rating determination.

## 430.1 Scope

This article covers motors, motor branch-circuit and feeder conductors and their protection, motor overload protection, motor control circuits, motor controllers, and motor control centers.

General, 430.1 through 430.18	Part I
Motor Circuit Conductors, 430.21 through 430.29	Part II
Motor and Branch-Circuit Overload Protection, 430.31 through 430.44	Part III
Motor Branch-Circuit Short-Circuit and Ground-Fault Protection, 430.51 through 430.58	Part IV
Motor Feeder Short-Circuit and Ground-Fault Protection, 430.61 through 430.63	Part V
Motor Control Circuits, 430.71 through 430.74	Part VI
Motor Controllers, 430.81 through 430.90	Part VII
Motor Control Centers, 430.92 through 430.98	Part VIII
Disconnecting Means, 430.101 through 430.113	Part IX
Adjustable Speed Drive Systems, 430.120 through 430.128	Part X
Over 600 Volts, Nominal, 430.221 through 430.227	Part XI
Protection of Live Parts—All Voltages, 430.231 through 430.233	Part XII
Grounding—All Voltages, 430.241 through 430.245	Part XIII
Tables, Tables 430.247 through 430.251(B)	Part XIV
Motor feeder	Part II 430.24, 430.25, 430.26
Motor feeder short-circuit and ground-fault protection	Part V
Motor disconnecting means	Part IX
Motor branch-circuit short-circuit and ground-fault protection	Part IV
Motor circuit conductor	Part II
Motor controller	Part VII
Motor control circuits	Part VI
Motor overload protection	Part III
Motor	Part I
Thermal protection	Part III

Secondary conductors	430.23
Secondary resistor	Part II 430.23 and Article 470

FIGURE 430.1 Article 430 Contents.

Informational Note No. 1: Installation requirements for motor control centers are covered in 110.26(E). Air-conditioning and refrigerating equipment are covered in Article 440.

Informational Note No. 2: Figure 430.1 is for information only.

Figure 430.1 is intended to assist the user in following the provisions of Article 430. The requirements for motors in Article 430 are categorized into 14 individual parts. Many of these parts are pictorially identified in Figure 430.1 as they pertain to the installation of motors.

## 430.2 Definitions

**Adjustable Speed Drive.** A combination of the power converter, motor, and motor-mounted auxiliary devices such as

encoders, tachometers, thermal switches and detectors, air blowers, heaters, and vibration sensors.

**Adjustable-Speed Drive System.** An interconnected combination of equipment that provides a means of adjusting the speed of a mechanical load coupled to a motor. A drive system typically consists of an adjustable speed drive and auxiliary electrical apparatus.

**Controller.** For the purpose of this article, a controller is any switch or device that is normally used to start and stop a motor by making and breaking the motor circuit current.

**Motor Control Circuit.** The circuit of a control apparatus or system that carries the electric signals directing the performance of the controller but does not carry the main power current.

**System Isolation Equipment.** A redundantly monitored, remotely operated contactor-isolating system, packaged to provide the disconnection/isolation function, capable of verifiable operation from multiple remote locations by means of lockout switches, each having the capability of being padlocked in the “off” (open) position.

**Valve Actuator Motor (VAM) Assemblies.** A manufactured assembly, used to operate a valve, consisting of an actuator motor and other components such as controllers, torque switches, limit switches, and overload protection.

Informational Note: VAMs typically have short-time duty and high-torque characteristics.

## 430.4 Part-Winding Motors

A part-winding start induction or synchronous motor is one that is arranged for starting by first energizing part of its primary (armature) winding and, subsequently, energizing the remainder of this winding in one or more steps. A standard part-winding start induction motor is arranged so that one-half of its primary winding can be energized initially, and, subsequently, the remaining half can be energized, both halves then carrying equal current. A hermetic refrigerant compressor motor shall not be considered a standard part-winding start induction motor.

Where separate overload devices are used with a standard part-winding start induction motor, each half of the motor winding shall be individually protected in accordance with 430.32 and 430.37 with a trip current one-half that specified.

Each motor-winding connection shall have branch-circuit short-circuit and ground-fault protection rated at not more than one-half that specified by 430.52.

*Exception: A short-circuit and ground-fault protective device shall be permitted for both windings if the device will allow the motor to start. Where time-delay (dual-element)*

*fuses are used, they shall be permitted to have a rating not exceeding 150 percent of the motor full-load current.*

### 430.5 Other Articles

Motors and controllers shall also comply with the applicable provisions of Table 430.5.

**TABLE 430.5 Other Articles**

Equipment/Occupancy	Article	Section
Air-conditioning and refrigerating equipment	440	
Capacitors		460.8, 460.9
Commercial garages; aircraft hangars; motor fuel dispensing facilities; bulk storage plants; spray application, dipping, and coating processes; and inhalation anesthetizing locations	511, 513, 514, 515, 516, and 517 Part IV	
Cranes and hoists	610	
Electrically driven or controlled irrigation machines	675	
Elevators, dumbwaiters, escalators, moving walks, wheelchair lifts, and stairway chair lifts	620	
Fire pumps	695	
Hazardous (classified) locations	500–503 and 505	
Industrial machinery	670

Motion picture and television studios and similar locations	530	
Resistors and reactors	470	
Theaters, audience areas of motion picture and television studios, and similar locations		520.48
Transformers and transformer vaults	450	

### 430.6 Ampacity and Motor Rating Determination

The size of conductors supplying equipment covered by Article 430 shall be selected from the allowable ampacity tables in accordance with 310.15(B) or shall be calculated in accordance with 310.15(C). Where flexible cord is used, the size of the conductor shall be selected in accordance with 400.5. The required ampacity and motor ratings shall be determined as specified in 430.6(A), (B), (C), and (D).

**(A) General Motor Applications.** For general motor applications, current ratings shall be determined based on (A) (1) and (A)(2).

**(1) Table Values.** Other than for motors built for low speeds (less than 1200 RPM) or high torques, and for multi-speed motors, the values given in Table 430.247, Table 430.248, Table 430.249, and Table 430.250 shall be used to determine the ampacity of conductors or ampere ratings of switches, branch-circuit short-circuit and ground-fault protection, instead of the actual current rating marked on the motor nameplate. Where a motor is marked in amperes, but not horsepower, the horsepower rating shall be assumed to be that corresponding to the value given in Table 430.247, Table 430.248, Table 430.249, and Table 430.250, interpolated if necessary. Motors built for low speeds (less than 1200 RPM) or high torques may have higher full-load currents, and multispeed motors will have full-load current varying with speed, in which case the nameplate current ratings shall be used.

*Exception No. 1: Multispeed motors shall be in accordance with 430.22(A) and 430.52.*

*Exception No. 2: For equipment that employs a shaded-pole or permanent-split capacitor-type fan or blower motor that is marked with the motor type, the full load current for such motor marked on the nameplate of the equipment in which the fan or blower motor is employed shall be used instead of the horsepower rating to determine the ampacity or rating of the disconnecting means, the branch-circuit conductors, the controller, the branch-circuit short-circuit and ground-fault protection, and the separate overload protection. This marking on the equipment nameplate shall not be less than the current marked on the fan or blower motor nameplate.*

*Exception No. 3: For a listed motor-operated appliance that is marked with both motor horsepower and full-load current, the motor full-load current marked on the nameplate of the appliance shall be used instead of the horsepower rating on the appliance nameplate to determine the ampacity or rating of the disconnecting means, the branch-circuit conductors, the controller, the branch-circuit short-circuit and ground-fault protection, and any separate overload protection.*

Exception No. 3 to 430.6(A)(1) is intended to resolve confusion that may result when motor-operated appliances are labeled with both horsepower and ampere ratings. The nameplate current rating in amperes is closely evaluated by the testing laboratories and is considered to be more accurate than the marked horsepower rating for motor-operated appliances.

**(2) Nameplate Values.** Separate motor overload protection shall be based on the motor nameplate current rating.

For general motor applications other than motors built for low speeds (less than 1200 rpm), multispeed motors, or high-torque motors, the ampacity of motor branch-circuit conductors, branch-circuit and ground-fault protection, and ampere rating of the motor disconnecting means are determined by the ampere values listed in Tables 430.247 through 430.250 rather than the ampere values marked on the motor nameplate. The ampere values are based on the horsepower rating and nominal voltage listed on the motor nameplate.

The ampere rating provided on the motor nameplate is used to size the overload protective devices intended to protect the motor, motor control apparatus, and motor branch-circuit conductors. Where the motor is marked with an ampere rating and not in horsepower, the horsepower is assumed to be that in Tables 430.247 through 430.250, based on the motor ampere rating from the nameplate.

**(B) Torque Motors.** For torque motors, the rated current shall be locked-rotor current, and this nameplate current shall be used to determine the ampacity of the branch-circuit conductors covered in 430.22 and 430.24, the ampere rating of the motor overload protection, and the ampere rating of motor branch-circuit short-circuit and ground-fault protection in accordance with 430.52(B).

Informational Note: For motor controllers and disconnecting means, see 430.83(D) and 430.110.

**(C) Alternating-Current Adjustable Voltage Motors.** For motors used in alternating-current, adjustable voltage, variable torque drive systems, the ampacity of conductors, or ampere ratings of switches, branch-circuit short-circuit and ground-fault protection, and so forth, shall be based on the maximum operating current marked on the motor or control nameplate, or both. If the maximum operating current does not appear on the nameplate, the ampacity determination shall be based on 150 percent of the values given in Table 430.249 and Table 430.250.

**(D) Valve Actuator Motor Assemblies.** For valve actuator motor assemblies (VAMs), the rated current shall be the nameplate full-load current, and this current shall be used to determine the maximum rating or setting of the motor branch-circuit short-circuit and ground-fault protective device and the ampacity of the conductors.

This section was added in the 2011 *Code*. A valve actuator motor assembly (VAM) typically has a full-load current rating marked on the nameplate in addition to the locked-rotor

current. Section 430.6(B) requires the locked-rotor current to be used to determine conductor sizes and overcurrent protection for torque motors. However, a VAM is not a torque motor. The nameplate full-load current is a more appropriate value to use for this purpose.

## 430.7 Marking on Motors and Multimotor Equipment

**(A) Usual Motor Applications.** A motor shall be marked with the following information:

- (1) Manufacturer's name.
- (2) Rated volts and full-load current. For a multispeed motor, full-load current for each speed, except shaded-pole and permanent-split capacitor motors where amperes are required only for maximum speed.
- (3) Rated frequency and number of phases if an ac motor.
- (4) Rated full-load speed.
- (5) Rated temperature rise or the insulation system class and rated ambient temperature.
- (6) Time rating. The time rating shall be 5, 15, 30, or 60 minutes, or continuous.
- (7) Rated horsepower if  $\frac{1}{8}$  hp or more. For a multispeed motor  $\frac{1}{8}$  hp or more, rated horsepower for each speed, except shaded-pole and permanent-split capacitor motors  $\frac{1}{8}$  hp or more where rated horsepower is required only for maximum speed. Motors of arc welders are not required to be marked with the horsepower rating.
- (8) Code letter or locked-rotor amperes if an alternating-current motor rated  $\frac{1}{2}$  hp or more. On polyphase wound-rotor motors, the code letter shall be omitted.

Informational Note: See 430.7(B).

- (9) Design letter for design B, C, or D motors.

Informational Note: Motor design letter definitions are found in ANSI/NEMA MG 1-1993, *Motors and Generators, Part 1, Definitions*, and in IEEE 100-1996, *Standard Dictionary of Electrical and Electronic Terms*.

The design letters referred to in 430.7(A) indicate a motor's speed/torque characteristic curve and are not to be confused with code letters, used in Table 430.7(B). For technical accuracy, code letters should be referred to as "locked-rotor indicating code letters," which are explained in 430.7(B). Design letters reflect characteristics inherent in motor design, such as locked-rotor current, slip at rated load, and locked-rotor and breakdown torque.

- (10) Secondary volts and full-load current if a wound-rotor induction motor.
- (11) Field current and voltage for dc excited synchronous motors.

- (12) Winding — straight shunt, stabilized shunt, compound, or series, if a dc motor. Fractional horsepower dc motors 175 mm (7 in.) or less in diameter shall not be required to be marked.
- (13) A motor provided with a thermal protector complying with 430.32(A)(2) or (B)(2) shall be marked “Thermally Protected.” Thermally protected motors rated 100 watts or less and complying with 430.32(B)(2) shall be permitted to use the abbreviated marking “T.P.”
- (14) A motor complying with 430.32(B)(4) shall be marked “Impedance Protected.” Impedance-protected motors rated 100 watts or less and complying with 430.32(B)(4) shall be permitted to use the abbreviated marking “Z.P.”
- (15) Motors equipped with electrically powered condensation prevention heaters shall be marked with the rated heater voltage, number of phases, and the rated power in watts.

Motors that are installed outdoors or in locations where condensation might accumulate in the motor often come equipped from the manufacturer with condensation-prevention heaters that are energized when the motor is turned off. Section 430.7(A)(15) requires the manufacturer to mark a motor provided with a condensation heater and alerts the installer to provide the proper electrical supply to the motor. See 430.113 for heater disconnecting means.

**(B) Locked-Rotor Indicating Code Letters.** Code letters marked on motor nameplates to show motor input with locked rotor shall be in accordance with Table 430.7(B).

The code letter indicating motor input with locked rotor shall be in an individual block on the nameplate, properly designated.

**(1) Multispeed Motors.** Multispeed motors shall be marked with the code letter designating the locked-rotor kilovolt-ampere (kVA) per horsepower (hp) for the highest speed at which the motor can be started.

*Exception: Constant horsepower multispeed motors shall be marked with the code letter giving the highest locked-rotor kilovolt-ampere (kVA) per horsepower (hp).*

**(2) Single-Speed Motors.** Single-speed motors starting on wye connection and running on delta connections shall be marked with a code letter corresponding to the locked-rotor kilovolt-ampere (kVA) per horsepower (hp) for the wye connection.

**(3) Dual-Voltage Motors.** Dual-voltage motors that have a different locked-rotor kilovolt-ampere (kVA) per horse-

**TABLE 430.7(B) Locked-Rotor Indicating Code Letters**

Code Letter	Kilovolt-Amperes per Horsepower with Locked Rotor
A	0–3.14
B	3.15–3.54
C	3.55–3.99
D	4.0–4.49
E	4.5–4.99
F	5.0–5.59
G	5.6–6.29
H	6.3–7.09
J	7.1–7.99
K	8.0–8.99
L	9.0–9.99
M	10.0–11.19
N	11.2–12.49
P	12.5–13.99
R	14.0–15.99
S	16.0–17.99
T	18.0–19.99
U	20.0–22.39
V	22.4 and up

power (hp) on the two voltages shall be marked with the code letter for the voltage giving the highest locked-rotor kilovolt-ampere (kVA) per horsepower (hp).

**(4) 50/60 Hz Motors.** Motors with 50- and 60-Hz ratings shall be marked with a code letter designating the locked-rotor kilovolt-ampere (kVA) per horsepower (hp) on 60 Hz.

**(5) Part-Winding Motors.** Part-winding start motors shall be marked with a code letter designating the locked-rotor kilovolt-ampere (kVA) per horsepower (hp) that is based on the locked-rotor current for the full winding of the motor.

The following example shows how to determine the locked-rotor current for a specific motor using Table 430.7(B), which lists a range of values for each code letter.

#### Calculation Example

A 20-hp, 460-volt, 3-phase motor has a nameplate kilovolt-ampere code letter G. Determine the maximum locked-rotor current for this motor.

#### Solution

**STEP 1.** Use Table 430.7(B) to find the maximum value in the range for code letter G, which is 6.29, or 6.29 kilovolt-amperes per horsepower.

STEP 2. Use the following formula to find the maximum locked-rotor current:

$$\begin{aligned}\text{Locked-rotor kVA} &= \text{motor hp} \\ &\quad \times \text{maximum code letter value} \\ &= 20 \times 6.29 = 125.8\end{aligned}$$

$$\text{Locked-rotor current} = \frac{\text{locked-rotor kVa}}{\sqrt{3} \times \text{kV}}$$

For 460 volts,

$$\frac{125.8}{1.73 \times 0.46} = 158 \text{ amperes}$$

**Conclusion:** The maximum locked-rotor current for a 20-hp, 460-volt motor with code letter G is 158 amperes when the system voltage is 460 volts.

**(C) Torque Motors.** Torque motors are rated for operation at standstill and shall be marked in accordance with 430.7(A), except that locked-rotor torque shall replace horsepower.

#### **(D) Multimotor and Combination-Load Equipment.**

**(1) Factory-Wired.** Multimotor and combination-load equipment shall be provided with a visible nameplate marked with the manufacturer's name, the rating in volts, frequency, number of phases, minimum supply circuit conductor ampacity, and the maximum ampere rating of the circuit short-circuit and ground-fault protective device. The conductor ampacity shall be calculated in accordance with 430.24 and counting all of the motors and other loads that will be operated at the same time. The short-circuit and ground-fault protective device rating shall not exceed the value calculated in accordance with 430.53. Multimotor equipment for use on two or more circuits shall be marked with the preceding information for each circuit.

Section 110.3(B) requires listed and labeled equipment to be used and installed in accordance with the manufacturer's instructions accompanying the equipment or marked on the nameplate. The nameplate marking for the maximum ampere rating of the branch-circuit short-circuit and ground-fault protective device may limit the type of protective device to a fuse by stipulating "fuse" without reference to a circuit breaker. That means the circuit to the equipment must be protected by fuses, such as by a fused disconnect switch. A circuit breaker located in a panelboard, switchboard, or similar distribution equipment is permitted to supply the switch or other equipment in which the fuses are installed.

**(2) Not Factory-Wired.** Where the equipment is not factory-wired and the individual nameplates of motors and other loads are visible after assembly of the equipment, the individual nameplates shall be permitted to serve as the required marking.

### **430.8 Marking on Controllers**

A controller shall be marked with the manufacturer's name or identification, the voltage, the current or horsepower rating, the short-circuit current rating, and such other necessary data to properly indicate the applications for which it is suitable.

Section 430.8 requires controllers to be marked with their short-circuit current rating. Four exceptions allow the short-circuit rating to be excluded from the controller nameplate under specified conditions.

*Exception No. 1: The short-circuit current rating is not required for controllers applied in accordance with 430.81(A) or (B).*

*Exception No. 2: The short-circuit rating is not required to be marked on the controller when the short-circuit current rating of the controller is marked elsewhere on the assembly.*

*Exception No. 3: The short-circuit rating is not required to be marked on the controller when the assembly into which it is installed has a marked short-circuit current rating.*

*Exception No. 4: Short-circuit ratings are not required for controllers rated less than 2 hp at 300 V or less and listed exclusively for general-purpose branch circuits.*

A controller that includes motor overload protection suitable for group motor application shall be marked with the motor overload protection and the maximum branch-circuit short-circuit and ground-fault protection for such applications.

Combination controllers that employ adjustable instantaneous trip circuit breakers shall be clearly marked to indicate the ampere settings of the adjustable trip element.

Where a controller is built in as an integral part of a motor or of a motor-generator set, individual marking of the controller shall not be required if the necessary data are on the nameplate. For controllers that are an integral part of equipment approved as a unit, the above marking shall be permitted on the equipment nameplate.

Informational Note: See 110.10 for information on circuit impedance and other characteristics.

430.9 Terminals

(A) **Markings.** Terminals of motors and controllers shall be suitably marked or colored where necessary to indicate the proper connections.

(B) **Conductors.** Motor controllers and terminals of control circuit devices shall be connected with copper conductors unless identified for use with a different conductor.

Terminals for motor controllers are tested, designed, and listed using copper conductors, unless marked for other conductors. Section 430.9(B) highlights this limitation while permitting other conductors to be used if they are determined to be suitable and are identified as such.

(C) **Torque Requirements.** Control circuit devices with screw-type pressure terminals used with 14 AWG or smaller copper conductors shall be torqued to a minimum of 0.8 N·m (7 lb-in.) unless identified for a different torque value.

Proper torque is essential for safe and reliable connections. A screw-type pressure terminal, which has not been torqued, may loosen during motor operation, resulting in overheating. Section 430.9(C) enhances safety by providing a minimum torque value for screw-type pressure terminals. See the commentary following 110.14(B) for more information on electrical connections.

430.10 Wiring Space in Enclosures

(A) **General.** Enclosures for motor controllers and disconnecting means shall not be used as junction boxes, auxiliary gutters, or raceways for conductors feeding through or tapping off to the other apparatus unless designs are employed that provide adequate space for this purpose.

Informational Note: See 312.8 for switch and overcurrent-device enclosures.

(B) **Wire-Bending Space in Enclosures.** Minimum wire-bending space within the enclosures for motor controllers shall be in accordance with Table 430.10(B) where measured in a straight line from the end of the lug or wire connector (in the direction the wire leaves the terminal) to the wall or barrier. Where alternate wire termination means are substituted for that supplied by the manufacturer of the controller, they shall be of a type identified by the manufacturer for use with the controller and shall not reduce the minimum wire-bending space.

Exhibit 430.1 illustrates the application of the wiring-bending space requirements of either 430.10(B) or 312.6(B) within an enclosure for a motor controller.

TABLE 430.10(B) Minimum Wire-Bending Space at the Terminals of Enclosed Motor Controllers

Size of Wire (AWG or kcmil)	Wires per Terminal*			
	1		2	
	mm	in.	mm	in.
14–10	Not specified		—	—
8–6	38	1½	—	—
4–3	50	2	—	—
2	65	2½	—	—
1	75	3	—	—
1/0	125	5	125	5
2/0	150	6	150	6
3/0–4/0	175	7	175	7
250	200	8	200	8
300	250	10	250	10
350–500	300	12	300	12
600–700	350	14	400	16
750–900	450	18	475	19

\*Where provision for three or more wires per terminal exists, the minimum wire-bending space shall be in accordance with the requirements of Article 312.

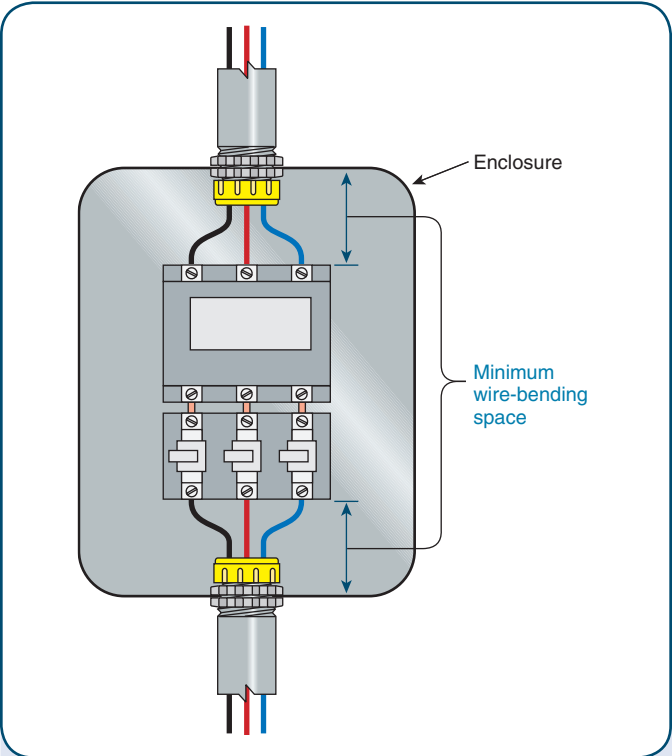

EXHIBIT 430.1 Wire-bending space in enclosures for motor controllers.

### 430.11 Protection Against Liquids

Suitable guards or enclosures shall be provided to protect exposed current-carrying parts of motors and the insulation of motor leads where installed directly under equipment, or in other locations where dripping or spraying oil, water, or other liquid is capable of occurring, unless the motor is designed for the existing conditions.

Exposed current-carrying parts and insulated leads of motors are required by 430.11 to be protected from liquids (dripping or spraying oil or other lubricants, water, or excessive moisture). The presence of liquids may cause deterioration and insulation breakdown. Excess lubricants in the motor can collect dirt and clog the cooling passages of the motor, causing the motor to overheat.

### 430.12 Motor Terminal Housings

**(A) Material.** Where motors are provided with terminal housings, the housings shall be of metal and of substantial construction.

*Exception: In other than hazardous (classified) locations, substantial, nonmetallic, noncombustible housings shall be permitted, provided an internal grounding means between the motor frame and the equipment grounding connection is incorporated within the housing.*

Nonmetallic terminal housings are permitted on motors of any size, provided the housing material has been determined to be nonburning, with, for example, a flammability rating of at least 94-5V in accordance with UL 746C, *Polymeric Materials — Use in Electrical Equipment Evaluations*.

**(B) Dimensions and Space — Wire-to-Wire Connections.** Where these terminal housings enclose wire-to-wire connections, they shall have minimum dimensions and usable volumes in accordance with Table 430.12(B).

**(C) Dimensions and Space — Fixed Terminal Connections.** Where these terminal housings enclose rigidly mounted motor terminals, the terminal housing shall be of sufficient size to provide minimum terminal spacings and usable volumes in accordance with Table 430.12(C)(1) and Table 430.12(C)(2).

**(D) Large Wire or Factory Connections.** For motors with larger ratings, greater number of leads, or larger wire sizes, or where motors are installed as a part of factory-wired equipment, without additional connection being required at the motor terminal housing during equipment installation,

**TABLE 430.12(B) Terminal Housings — Wire-to-Wire Connections**

Motors 275 mm (11 in.) in Diameter or Less					
Horsepower	Cover Opening Minimum Dimension		Usable Volume Minimum		
	mm	in.	cm <sup>3</sup>	in. <sup>3</sup>	
1 and smaller <sup>a</sup>	41	1 $\frac{5}{8}$	170	10.5	
1 $\frac{1}{2}$ , 2, and 3 <sup>b</sup>	45	1 $\frac{3}{4}$	275	16.8	
5 and 7 $\frac{1}{2}$	50	2	365	22.4

250	150	6.0	7,380	450	100 200
400	175	7.0	13,775	840	150 300
600	200	8.0	25,255	1540	250 500
Direct-Current Motors					
Maximum Full-Load Current for Motors with Maximum of 6 Leads (Amperes)	Terminal Box Minimum Dimensions		Usable Volume Minimum		
	mm	in.	cm <sup>3</sup>	in. <sup>3</sup>	
68	65	2.5	425	26	
105	84	3.3	900	55	
165	100	4.0	1,640	100	
240	125	5.0	2,950	180	
375	150	6.0	5,410	330	
600	175	7.0	9,840	600	
900	200	8.0	18,040	1,100	

Note: Auxiliary leads for such items as brakes, thermostats, space heaters, and exciting fields shall be permitted to be neglected if their current-carrying area does not exceed 25 percent of the current-carrying area of the machine power leads.

<sup>a</sup>For motors rated 1 hp and smaller, and with the terminal housing partially or wholly integral with the frame or end shield, the volume of the terminal housing shall not be less than 18.0 cm<sup>3</sup> (1.1 in.<sup>3</sup>) per wire-to-wire connection. The minimum cover opening dimension is not specified.

<sup>b</sup>For motors rated 1 $\frac{1}{2}$ , 2, and 3 hp, and with the terminal housing partially or wholly integral with the frame or end shield, the volume of the terminal housing shall not be less than 23.0 cm<sup>3</sup> (1.4 in.<sup>3</sup>) per wire-to-wire connection. The minimum cover opening dimension is not specified.

**TABLE 430.12(C)(1) Terminal Spacings — Fixed Terminals**

Nominal Volts	Minimum Spacing			
	Between Line Terminals		Between Line Terminals and Other Uninsulated Metal Parts	
	mm	in.	mm	in.
240 or less	6	¼	6	¼
Over 250 – 600	10	⅜	10	⅜

**TABLE 430.12(C)(2) Usable Volumes — Fixed Terminals**

Power-Supply Conductor Size (AWG)	Minimum Usable Volume per Power-Supply Conductor	
	cm <sup>3</sup>	in. <sup>3</sup>
14	16	1
12 and 10	20	1¼
8 and 6	37	2¼

the terminal housing shall be of ample size to make connections, but the foregoing provisions for the volumes of terminal housings shall not be considered applicable.

**(E) Equipment Grounding Connections.** A means for attachment of an equipment grounding conductor termination in accordance with 250.8 shall be provided at motor terminal housings for wire-to-wire connections or fixed terminal connections. The means for such connections shall be permitted to be located either inside or outside the motor terminal housing.

*Exception: Where a motor is installed as a part of factory-wired equipment that is required to be grounded and without additional connection being required at the motor terminal housing during equipment installation, a separate means for motor grounding at the motor terminal housing shall not be required.*

### 430.13 Bushing

Where wires pass through an opening in an enclosure, conduit box, or barrier, a bushing shall be used to protect the conductors from the edges of openings having sharp edges. The bushing shall have smooth, well-rounded surfaces where it may be in contact with the conductors. If used where oils, greases, or other contaminants may be present, the bushing shall be made of material not deleteriously affected.

Informational Note: For conductors exposed to deteriorating agents, see 310.10(G).

### 430.14 Location of Motors

**(A) Ventilation and Maintenance.** Motors shall be located so that adequate ventilation is provided and so that maintenance, such as lubrication of bearings and replacing of brushes, can be readily accomplished.

*Exception: Ventilation shall not be required for submersible types of motors.*

**(B) Open Motors.** Open motors that have commutators or collector rings shall be located or protected so that sparks cannot reach adjacent combustible material.

*Exception: Installation of these motors on wooden floors or supports shall be permitted.*

### 430.16 Exposure to Dust Accumulations

In locations where dust or flying material collects on or in motors in such quantities as to seriously interfere with the ventilation or cooling of motors and thereby cause dangerous temperatures, suitable types of enclosed motors that do not overheat under the prevailing conditions shall be used.

Informational Note: Especially severe conditions may require the use of enclosed pipe-ventilated motors, or enclosure in separate dusttight rooms, properly ventilated from a source of clean air.

For motors exposed to combustible dust or readily ignitable flying material, see the requirements of 502.125 (Class II, Divisions 1 and 2) and 503.125 (Class III, Divisions 1 and 2). For classification of locations, see 500.5(C) (Class II locations) and 500.5(D) (Class III locations).

### 430.17 Highest Rated or Smallest Rated Motor

In determining compliance with 430.24, 430.53(B), and 430.53(C), the highest rated or smallest rated motor shall be based on the rated full-load current as selected from Table 430.247, Table 430.248, Table 430.249, and Table 430.250.

### 430.18 Nominal Voltage of Rectifier Systems

The nominal value of the ac voltage being rectified shall be used to determine the voltage of a rectifier derived system.

*Exception: The nominal dc voltage of the rectifier shall be used if it exceeds the peak value of the ac voltage being rectified.*

## II. Motor Circuit Conductors

### 430.21 General

Part II specifies ampacities of conductors that are capable of carrying the motor current without overheating under the conditions specified.

The provisions of Part II shall not apply to motor circuits rated over 600 volts, nominal.

The provisions of Articles 250, 300, and 310 shall not apply to conductors that form an integral part of equipment, such as motors, motor controllers, motor control centers, or other factory-assembled control equipment.

Informational Note No. 1: See 300.1(B) and 310.1 for similar requirements.

Informational Note No. 2: See 110.14(C) and 430.9(B) for equipment device terminal requirements.

Informational Note No. 3: For over 600 volts, nominal, see Part XI.

### 430.22 Single Motor

Conductors that supply a single motor used in a continuous duty application shall have an ampacity of not less than 125 percent of the motor full-load current rating, as determined by 430.6(A)(1), or not less than specified in 430.22(A) through (G).

Section 430.22 was rewritten for the 2011 *Code* to correlate the requirements for wye-start, delta-run motors with other sections and to provide additional information for dc motors. The main rule of 430.22 describes the branch-circuit requirements for single motor installations. Generally, the branch circuit that serves a continuous-duty motor must be sized at 125 percent of the motor full-load current or greater. The provision for a conductor with an ampacity of at least 125 percent of the motor full-load current rating does not constitute a conductor derating; rather, it is based on the need to provide for a sustained running current that is greater than the rated full-load current and for protection of the conductors by the motor overload protective device set above the motor full-load current rating.

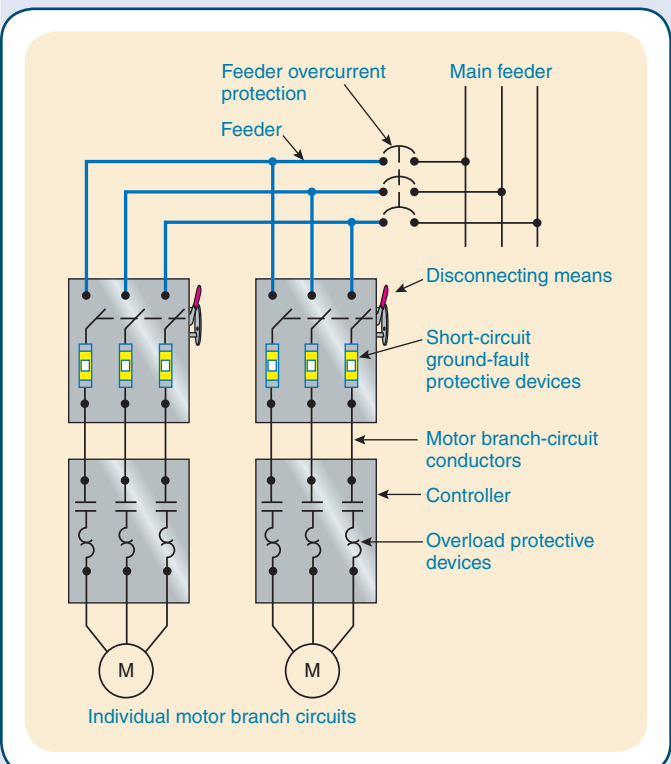

The ampacity of the motor branch-circuit conductors is based on the full-load current rating values provided in Tables 430.248 through 430.250. Motor nameplate full-load current is not to be used to size branch-circuit conductors.

Exhibit 430.2 illustrates each motor on an individual branch circuit with branch-circuit short-circuit and ground-fault protective devices and disconnecting means in one location, and controllers and overload protection at the motor locations.

Exhibit 430.3 also illustrates each motor on an individual

**EXHIBIT 430.2** A main distribution center supplying individual branch circuits to each motor (branch-circuit short-circuit and ground-fault protective devices).

**EXHIBIT 430.3** A feeder supplying individual branch circuits to each motor per 430.28.

branch circuit, but, unlike Exhibit 430.2, the branch circuits are tapped from a feeder at a convenient location, such as a junction box or wireway, or from open wiring. The tap conductors are required to terminate in a branch-circuit protective device located not more than 25 ft from where the taps are connected to the feeder, in accordance with 430.28. Also see 430.28, Exception, which permits a 100-ft tap under some conditions in high-bay manufacturing facilities.

Exhibit 430.4 illustrates the following essential parts of a motor branch circuit:

1. Branch-circuit conductors
2. Disconnecting means
3. Branch-circuit short-circuit and ground-fault protective devices
4. Motor-controller
5. Motor overload protective devices

**EXHIBIT 430.4** A motor branch circuit showing the essential parts. In this case, both the controller and motor are assumed to be within sight of the disconnecting means so additional disconnecting means for the controller and motor are not required per 430.102.

The branch-circuit short-circuit and ground-fault protective device may be a fuse or a circuit breaker and must be capable of carrying the starting current of the motor without opening the circuit. See Table 430.52.

In general, every motor must be provided with overload

protective devices intended to protect the motor windings, motor-control apparatus, and motor branch-circuit conductors against excessive heating due to motor overloads and failure to start. Overload in equipment is defined as operation in excess of normal full-load rating, which, when it persists for a sufficient length of time, causes damage or dangerous overheating. Overload in a motor includes a stalled rotor but does not include fault currents due to short circuits or ground faults. See 430.44 for conditions where providing automatic opening of a motor circuit due to overload may be objectionable.

**(A) Direct-Current Motor-Rectifier Supplied.** For dc motors operating from a rectified power supply, the conductor ampacity on the input of the rectifier shall not be less than 125 percent of the rated input current to the rectifier. For dc motors operating from a rectified single-phase power supply, the conductors between the field wiring output terminals of the rectifier and the motor shall have an ampacity of not less than the following percentages of the motor full-load current rating:

- (1) Where a rectifier bridge of the single-phase, half-wave type is used, 190 percent.
- (2) Where a rectifier bridge of the single-phase, full-wave type is used, 150 percent.

The requirements of this section were based on the exception to the former 430.22(A). Requirements have been added for sizing of conductors on the input side of the rectifier, which is 125 percent of the rated input current to the rectifier. The ampacity of the output conductors depends on whether the rectifier is full-wave or half-wave.

**(B) Multispeed Motor.** For a multispeed motor, the selection of branch-circuit conductors on the line side of the controller shall be based on the highest of the full-load current ratings shown on the motor nameplate. The ampacity of the branch-circuit conductors between the controller and the motor shall not be less than 125 percent of the current rating of the winding(s) that the conductors energize.

**(C) Wye-Start, Delta-Run Motor.** For a wye-start, delta-run connected motor, the ampacity of the branch-circuit conductors on the line side of the controller shall not be less than 125 percent of the motor full-load current as determined by 430.6(A)(1). The ampacity of the conductors between the controller and the motor shall not be less than 72 percent of the motor full-load current rating as determined by 430.6(A)(1).

A wye-start, delta-run winding configuration is a method of providing reduced-voltage starting for a polyphase induction motor. This method requires a specific type of motor controller and a delta-wired motor with all leads brought out to the terminal box. This method of starting finds wide application in certain compressors used for air conditioning and where the driven machinery is allowed to start unloaded. During starting, the windings are arranged in a wye configuration. The wye-start configuration results in a reduced starting voltage of a mathematical ratio of  $1/\sqrt{3} = 0.5774$ , or 58 percent of the full line voltage, which results in approximately 58 percent starting current and about one-third of the normal starting torque. Once the motor attains speed, the windings are reconfigured to run as delta, giving full line voltage to the individual windings, which allows the motor to have full torque capability. Since the delta-connected motor load is 58 percent of the rated load current and the conductors are sized at 125 percent of the motor full-load current, the conductors would be sized at 1.25 times 58 percent or 72 percent of the motor full-load current rating.

In Exhibit 430.5, conductors from terminals  $T_1$ ,  $T_2$ , and  $T_3$  to the motor, as well as the conductors from terminals  $T_4$ ,  $T_5$ , and  $T_6$  to the motor, are all sized at 58 percent of the full-load current used to size the conductors that supply  $L_1$ ,  $L_2$ , and  $L_3$ .

**EXHIBIT 430.5** An elementary wiring diagram of a typical wye-start, delta-run motor and controller. During START, contacts 1M and S are closed and contacts 2M are open. During RUN, contacts 1M and 2M are closed and contacts S are open. (Courtesy of Schneider Electric)

**Informational Note:** The individual motor circuit conductors of a wye-start, delta-run connected motor carry 58 percent of the rated load current. The multiplier of 72 percent is obtained by multiplying 58 percent by 1.25.

This informational note was added for the 2011 *Code*. A part-winding motor starter supplies power to partial sections of the primary winding of the motor. When the motor is running, load on the conductors will be approximately 50 percent of motor full-load current. Sixty-two percent of the full-load current rating is 125 percent of the running current with all windings connected.

**(D) Part-Winding Motor.** For a part-winding connected motor, the ampacity of the branch-circuit conductors on the line side of the controller shall not be less than 125 percent of the motor full-load current as determined by 430.6(A)(1). The ampacity of the conductors between the controller and the motor shall not be less than 62.5 percent of the motor full-load current rating as determined by 430.6(A)(1).

**Informational Note:** The multiplier of 62.5 percent is obtained by multiplying 50 percent by 1.25.

**(E) Other Than Continuous Duty.** Conductors for a motor used in a short-time, intermittent, periodic, or varying duty application shall have an ampacity of not less than the percentage of the motor nameplate current rating shown in Table 430.22(E), unless the authority having jurisdiction grants special permission for conductors of lower ampacity.

Most motor applications are continuous duty, meaning they operate at a constant load for an indefinitely long time. For motors that are not continuous duty, the motor nameplate currents and Table 430.22(E) are used to determine the branch-circuit ampacity. A motor is considered to be for continuous duty unless the nature of the apparatus it drives is such that the motor cannot operate continuously with load under any condition of use. Conductors for a motor used for short-time, intermittent, periodic, or varying duty are required to have an ampacity in accordance with Table 430.22(E). Branch-circuit conductors for a motor with a rated horsepower used for 5-minute short-time duty service are permitted to be sized smaller than for the same motor with a 60-minute rating, due to the cooling intervals between operating periods. For example, a 5-minute rated motor will run for 5 minutes and then be off for 55 minutes. The terms *continuous duty*, *intermittent duty*, *periodic duty*, *short-time duty*, and *varying duty* are defined in Article 100.

**(F) Separate Terminal Enclosure.** The conductors between a stationary motor rated 1 hp or less and the separate terminal enclosure permitted in 430.245(B) shall be permitted to be smaller than 14 AWG but not smaller than 18 AWG, provided they have an ampacity as specified in 430.22(A).

**TABLE 430.22(E) Duty-Cycle Service**

Classification of Service	Nameplate Current Rating Percentages			
	5-Minute Rated Motor	15-Minute Rated Motor	30- & 60-Minute Rated Motor	Continuous Rated Motor
Short-time duty operating valves, raising or lowering rolls, etc.	110	120	150	—
Intermittent duty freight and passenger elevators, tool heads, pumps, drawbridges, turntables, etc. (for arc welders, see 630.11)	85	85	90	140
Periodic duty rolls, ore- and coal-handling machines, etc.	85	90	95	140
Varying duty	110	120	150	200

Note: Any motor application shall be considered as continuous duty unless the nature of the apparatus it drives is such that the motor will not operate continuously with load under any condition of use.

**(G) Conductors for Small Motors.** Conductors for small motors shall not be smaller than 14 AWG unless otherwise permitted in 430.22(G)(1) or (G)(2).

**(1) 18 AWG Copper.** Where installed in a cabinet or enclosure, 18 AWG individual copper conductors, copper conductors that are part of a jacketed multiconductor cable assembly, or copper conductors in a flexible cord shall be permitted, under either of the following sets of conditions:

- (1) Motor circuits with a full-load ampacity greater than 3.5 amperes or less than or equal to 5 amperes if all the following conditions are met:
  - a. The circuit is protected in accordance with 430.52.
  - b. The circuit is provided with maximum Class 10 overload protection in accordance with 430.32.
  - c. Overcurrent protection is provided in accordance with 240.4(D)(1)(2).
- (2) Motor circuits with a full-load ampacity of 3.5 amperes or less if all the following conditions are met:
  - a. The circuit is protected in accordance with 430.52.
  - b. The circuit is provided with maximum Class 20 overload protection in accordance with 430.32.

- c. Overcurrent protection is provided in accordance with 240.4(D)(1)(2).

**(2) 16 AWG Copper.** Where installed in a cabinet or enclosure, 16 AWG individual copper conductors, copper conductors that are part of a jacketed multiconductor cable assembly, or copper conductors in a flexible cord shall be permitted under either of the following sets of conditions:

- (1) Motor circuits with a full-load ampacity greater than 5.5 amperes and less than or equal to 8 amperes if all the following conditions are met:
  - a. The circuit is protected in accordance with 430.52.
  - b. The circuit is provided with maximum Class 10 overload protection in accordance with 430.32.
  - c. Overcurrent protection is provided in accordance with 240.4(D)(2)(2).
- (2) Motor circuits with a full-load ampacity of 5.5 amperes or less if all the following conditions are met:
  - a. The circuit is protected in accordance with 430.52.
  - b. The circuit is provided with maximum Class 20 overload protection in accordance with 430.32.
  - c. Overcurrent protection is provided in accordance with 240.4(D)(2)(2).

This section was rewritten for the 2011 *Code* to correlate the detailed requirements for applying small motor circuit conductors in Article 430 with those found in NFPA 79, *Electrical Standard for Industrial Machinery*. The requirement of this section limits the type of conductors that can be utilized or limits their location to a “protected” area such as a cabinet or enclosure. It then specifies the classes of overload relays and the sizes of overcurrent protective devices, based upon the motor full-load amperes.

### 430.23 Wound-Rotor Secondary

**(A) Continuous Duty.** For continuous duty, the conductors connecting the secondary of a wound-rotor ac motor to its controller shall have an ampacity not less than 125 percent of the full-load secondary current of the motor.

**(B) Other Than Continuous Duty.** For other than continuous duty, these conductors shall have an ampacity, in percent of full-load secondary current, not less than that specified in Table 430.22(E).

**(C) Resistor Separate from Controller.** Where the secondary resistor is separate from the controller, the ampacity of the conductors between controller and resistor shall not be less than that shown in Table 430.23(C).

TABLE 430.23(C) Secondary Conductor

Resistor Duty Classification	Ampacity of Conductor in Percent of Full-Load Secondary Current
Light starting duty	35
Heavy starting duty	45
Extra-heavy starting duty	55
Light intermittent duty	65
Medium intermittent duty	75
Heavy intermittent duty	85
Continuous duty	110

430.24 Several Motors or a Motor(s) and Other Load(s)

Conductors supplying several motors, or a motor(s) and other load(s), shall have an ampacity not less than the sum of each of the following:

- (1) 125 percent of the full-load current rating of the highest rated motor, as determined by 430.6(A)
- (2) Sum of the full-load current ratings of all the other motors in the group, as determined by 430.6(A)
- (3) 100 percent of the noncontinuous non-motor load
- (4) 125 percent of the continuous non-motor load.

Informational Note: See Informative Annex D, Example No. D8.

This section was rewritten for the 2011 *Code*. The modified text provides a more complete explanation of how the ampacity is calculated. It requires factors be added for the motors on the circuit and for nonmotor loads on the circuit.

Where motors are connected to a 15- or 20-ampere branch circuit that also supplies lighting or other appliance loads, as illustrated in Exhibit 430.6, the provisions of Article 210 and Article 430 apply. Motors rated less than 1 hp may be connected to these circuits, and they must be provided with overload protective devices unless the motors are not permanently installed, are started manually, and are within sight from the controller location. For additional information on the installation of motors (1 hp or less), see 430.32(B) and (C) and 430.53(A).

Where branch circuits or feeders serve motors and/or other electrical loads, the highest rating or setting of the branch circuit or feeder short-circuit and ground-fault protective devices for the minimum-size branch circuit or feeder conductor permitted by 430.24 is specified in 430.62.

Where the selection of a feeder protective device of higher rating or setting is based on the simultaneous starting of two or more motors, the size of the feeder conductors is

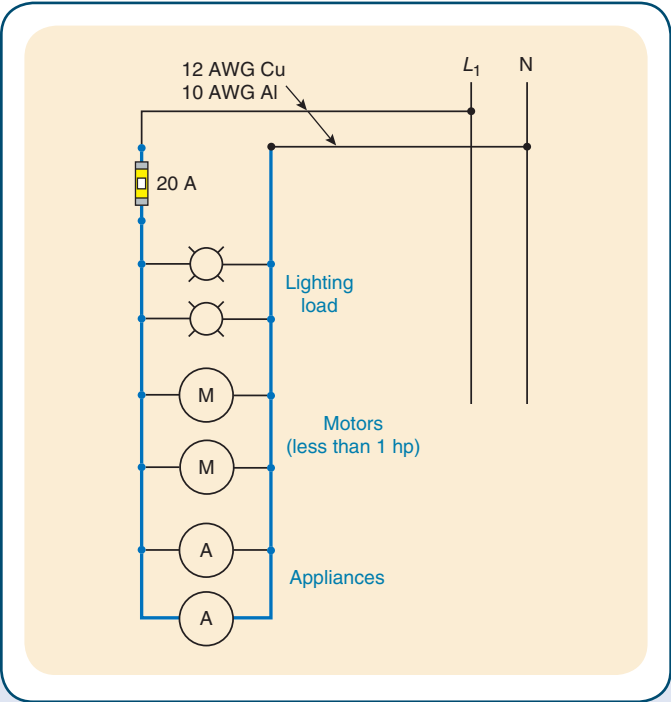

EXHIBIT 430.6 A 20-ampere branch circuit supplying lighting, small motors, and appliances.

required to be increased accordingly. Except where two or more motors may be started simultaneously, the heaviest load that a feeder will ever be required to carry occurs when the largest motor is started and all the other motors supplied by the same feeder are running and delivering their full-rated horsepower.

This requirement and those of 430.62 for the short-circuit and ground-fault protection of the branch circuit or feeder are based on the principle that the conductors should be sized to have an ampacity equal to 125 percent of the full-load current of the largest motor plus the full-load currents of all other motors and all other loads supplied by the feeder.

Where the conductors are branch-circuit conductors to multimotor equipment, 430.53 specifies the maximum rating of the branch-circuit short-circuit and ground-fault protective device, and 430.7(D)(1) requires the maximum ampere rating of the short-circuit and ground-fault protective device to be marked on multimotor equipment.

See 430.62(B) and the associated commentary if the size of the feeder conductors is larger than the minimum size.

*Exception No. 1: Where one or more of the motors of the group are used for short-time, intermittent, periodic, or varying duty, the ampere rating of such motors to be used in the summation shall be determined in accordance with 430.22(E). For the highest rated motor, the greater of either*

the ampere rating from 430.22(E) or the largest continuous duty motor full-load current multiplied by 1.25 shall be used in the summation.

*Exception No. 2: The ampacity of conductors supplying motor-operated fixed electric space-heating equipment shall comply with 424.3(B).*

*Exception No. 3: Where the circuitry is interlocked so as to prevent simultaneous operation of selected motors or other loads, the conductor ampacity shall be permitted to be based on the summation of the currents of the motors and other loads to be operated simultaneously that results in the highest total current.*

### 430.25 Multimotor and Combination-Load Equipment

The ampacity of the conductors supplying multimotor and combination-load equipment shall not be less than the minimum circuit ampacity marked on the equipment in accordance with 430.7(D). Where the equipment is not factory-wired and the individual nameplates are visible in accordance with 430.7(D)(2), the conductor ampacity shall be determined in accordance with 430.24.

When computing the load for the minimum allowable conductor size for a combination lighting (or lighting and appliance) load and motor load, the lighting load is determined in accordance with Article 220 (and other applicable articles and sections), the appliance load in accordance with Article 422, and the motor load in accordance with 430.22 (single motor) or 430.24 (two or more motors). The lighting load and the motor load are added together to determine the minimum conductor ampacity.

### 430.26 Feeder Demand Factor

Where reduced heating of the conductors results from motors operating on duty-cycle, intermittently, or from all motors not operating at one time, the authority having jurisdiction may grant permission for feeder conductors to have an ampacity less than specified in 430.24, provided the conductors have sufficient ampacity for the maximum load determined in accordance with the sizes and number of motors supplied and the character of their loads and duties.

The authority having jurisdiction (AHJ) may grant permission to allow a demand factor of less than 100 percent if operational procedures, production demands, or the nature of the work is such that not all the motors are running at one time. Engineering study or evaluation of motor operation may provide information that allows a demand factor of less

than 100 percent. Application of demand factors is subject to the approval of the AHJ.

**Informational Note:** Demand factors determined in the design of new facilities can often be validated against actual historical experience from similar installations. Refer to ANSI/IEEE Std. 141, *IEEE Recommended Practice for Electric Power Distribution for Industrial Plants*, and ANSI/IEEE Std. 241, *Recommended Practice for Electric Power Systems in Commercial Buildings*, for information on the calculation of loads and demand factor.

### 430.27 Capacitors with Motors

Where capacitors are installed in motor circuits, conductors shall comply with 460.8 and 460.9.

### 430.28 Feeder Taps

Feeder tap conductors shall have an ampacity not less than that required by Part II, shall terminate in a branch-circuit protective device, and, in addition, shall meet one of the following requirements:

- (1) Be enclosed either by an enclosed controller or by a raceway, be not more than 3.0 m (10 ft) in length, and, for field installation, be protected by an overcurrent device on the line side of the tap conductor, the rating or setting of which shall not exceed 1000 percent of the tap conductor ampacity
- (2) Have an ampacity of at least one-third that of the feeder conductors, be suitably protected from physical damage or enclosed in a raceway, and be not more than 7.5 m (25 ft) in length
- (3) Have an ampacity not less than the feeder conductors

*Exception: Feeder taps over 7.5 m (25 ft) long. In high-bay manufacturing buildings [over 11 m (35 ft) high at walls], where conditions of maintenance and supervision ensure that only qualified persons service the systems, conductors tapped to a feeder shall be permitted to be not over 7.5 m (25 ft) long horizontally and not over 30.0 m (100 ft) in total length where all of the following conditions are met:*

- (1) The ampacity of the tap conductors is not less than one-third that of the feeder conductors.
- (2) The tap conductors terminate with a single circuit breaker or a single set of fuses complying with (1) Part IV, where the load-side conductors are a branch circuit, or (2) Part V, where the load-side conductors are a feeder.
- (3) The tap conductors are suitably protected from physical damage and are installed in raceways.
- (4) The tap conductors are continuous from end-to-end and contain no splices.
- (5) The tap conductors shall be 6 AWG copper or 4 AWG aluminum or larger.

- (6) The tap conductors shall not penetrate walls, floors, or ceilings.
- (7) The tap shall not be made less than 9.0 m (30 ft) from the floor.

Section 430.28 contains three basic requirements for feeder taps that supply motor circuits.

First, the tap conductor from the feeder to the motor overcurrent device must be sized according to Part II of Article 430. For a single motor load, the tap conductors are sized the same as the motor branch-circuit conductors, that is, according to 430.22, which requires that motor branch-circuit conductors be sized at least 125 percent of the full-load current value for the motor given in Tables 430.248 through 430.250. The table value, rather than the nameplate value, is the full-load current used for conductor sizing according to 430.6(A).

Second, the tap conductors must terminate in a set of fuses or a circuit breaker, thus limiting the load on the tap conductors. The reduced-size tap conductors are protected from overload by the terminal overcurrent device but protected from short-circuit (and ground-fault) only from the feeder overcurrent device.

Third, where the tap conductor ampacity is less than the ampacity of the feeder, the tap conductor installation must meet the additional requirements associated with their tap conductor distance limits, that is, 10 ft, 25 ft, or, by exception, 100 ft.

The requirements for tap conductors that supply motor loads are somewhat similar to the basic tap requirements found in 240.21. For example, where tap conductors supply a motor load and do not exceed 10 ft, the tap conductors must be sized for the load, terminate in a set of fuses or a circuit breaker, be enclosed by a controller or a raceway, and be protected by a feeder overcurrent device not exceeding 10 times the tap conductor ampacity.

Where the tap conductors supply a motor load and do not exceed 25 ft, the tap conductors must be sized for the load, terminate in a set of fuses or a circuit breaker, be protected from physical damage or be enclosed in a raceway, and have an ampacity at least one-third that of the feeder conductor.

In a high-bay manufacturing building, feeder taps up to 100 ft long are conditionally permitted under the exception to 430.28.

#### Calculation Example

A 15-hp, 230-volt, 3-phase, NEMA Design B, squirrel-cage induction motor with a service factor of 1.15 is to be supplied by a tap from a 250-kcmil feeder. Assuming three conductors in an individual raceway, all Type THWN copper, and no ambient correction factor, the feeder has an ampacity of 255 amperes [from Table 310.15(B)(16), 75°C column].

Where the tap conductors are not over 25 ft long (see Exhibit 430.7), 4 AWG conductors with an ampacity of 85 amperes are permitted ( $\frac{1}{3} \times 255 \text{ amperes} = 85 \text{ amperes}$ ). Determine the required branch-circuit short-circuit and ground-fault protection and the overload protection required.

**EXHIBIT 430.7** Protective devices (branch-circuit short-circuit and ground-fault) for a motor branch circuit located not more than 25 ft from the point where the conductors are tapped to a feeder, per 430.28.

#### Solution

Based on 430.6(A) and Table 430.250, the full-load current of the 15-hp motor is 42 amperes. According to 430.52(C) (1), the motor branch-circuit short-circuit and ground-fault protective device cannot exceed the values given in Table 430.52. The maximum time-delay fuse value is  $42 \times 1.75 = 73.5$  amperes. The maximum inverse time circuit breaker value is  $42 \times 2.50 = 105$  amperes.

Section 430.52(C)(1), Exception No. 1, allows the next higher standard size — 80 and 110 amperes, respectively. A higher size, based on Exception No. 2, is allowed if the 80- or 110-ampere size is not adequate to start the motor.

Based on 430.32, for a motor with a service factor of 1.15, the motor overload protective devices (heaters) are required to be set at a value not greater than 125 percent of the full-load ampere rating marked on the motor nameplate. A higher-sized motor overload protective device setting of up to 140 percent may be used according to the permissive rules in 430.32(C). Regardless of the exact setting, with the motor overload protection set at approximately 50 amperes, the 4 AWG THWN copper motor branch-circuit tap conductors are well protected from overload.

For additional information concerning taps supplying motor circuits for group installations, see 430.53(D) and the associated commentary.

430.29 Constant Voltage Direct-Current Motors — Power Resistors

Conductors connecting the motor controller to separately mounted power accelerating and dynamic braking resistors in the armature circuit shall have an ampacity not less than the value calculated from Table 430.29 using motor full-load current. If an armature shunt resistor is used, the power accelerating resistor conductor ampacity shall be calculated using the total of motor full-load current and armature shunt resistor current.

Armature shunt resistor conductors shall have an ampacity of not less than that calculated from Table 430.29 using rated shunt resistor current as full-load current.

TABLE 430.29 Conductor Rating Factors for Power Resistors

Time in Seconds		Ampacity of Conductor in Percent of Full-Load Current
On	Off	
5	75	35
10	70	45
15	75	55
15	45	65
15	30	75
15	15	85
Continuous Duty		110

III. Motor and Branch-Circuit Overload Protection

430.31 General

Part III specifies overload devices intended to protect motors, motor-control apparatus, and motor branch-circuit conductors against excessive heating due to motor overloads and failure to start.

Informational Note: See the definition of *Overload* in Article 100.

These provisions shall not require overload protection where a power loss would cause a hazard, such as in the case of fire pumps.

Informational Note: For protection of fire pump supply conductors, see 695.6.

The provisions of Part III shall not apply to motor circuits rated over 600 volts, nominal.

Informational Note No. 1: For over 600 volts, nominal, see Part XI.

Informational Note No. 2: See Informative Annex D, Example No. D8.

Section 430.31 sets the general requirements for motor overload protection. The purpose of this protection is to guard the motor against abnormal operating conditions such as failure to start from a locked rotor, a single-phase condition, added friction on the driven load, or actual mechanical overloading of the driven load. The overload protection also guards against excessive heating in the motor caused by an overload condition or from a loss of phase condition.

Adequately applied overload protection should protect the motor from any overload condition prior to damage occurring in the motor. Overload protection is not designed or may not be capable of breaking short-circuit current or ground-fault current. Overload protection is not permitted to be installed where it could cause increased hazards as identified for fire pumps.

430.32 Continuous-Duty Motors

(A) **More Than 1 Horsepower.** Each motor used in a continuous duty application and rated more than 1 hp shall be protected against overload by one of the means in 430.32(A)(1) through (A)(4).

The basic premise of 430.32(A) through (E) is that the operation of a motor in excess of its normal full-load rating for a prolonged period of time causes damage or dangerous overheating that may start a fire. Overload protection is intended to protect the motor and the system components from damaging overload currents.

A continuous-duty motor with a marked service factor of 1.15 or greater or with a marked temperature rise of 40°C or less can carry a 25 percent overload for an extended period without damage to the motor. Other similar types of motors are those with a service factor of less than 1.15 or those with a marked temperature rise greater than 40°C that are incapable of withstanding a prolonged overload, where the motor overload protective device opens the circuit if the motor continues to draw 115 percent of its rated full-load current.

A *continuous-duty motor* is not the same as *continuous load*. The duty of a motor is determined by the application of the motor as defined in Article 100 under *duty*.

(1) **Separate Overload Device.** A separate overload device that is responsive to motor current. This device shall be selected to trip or shall be rated at no more than the following percent of the motor nameplate full-load current rating:

Motors with a marked service factor 1.15 or greater	125%
Motors with a marked temperature rise 40°C or less	125%
All other motors	115%

Modification of this value shall be permitted as provided in 430.32(C). For a multispeed motor, each winding connection shall be considered separately.

Where a separate motor overload device is connected so that it does not carry the total current designated on the motor nameplate, such as for wye-delta starting, the proper percentage of nameplate current applying to the selection or setting of the overload device shall be clearly designated on the equipment, or the manufacturer's selection table shall take this into account.

**Informational Note:** Where power factor correction capacitors are installed on the load side of the motor overload device, see 460.9.

Motors are required to be protected from overloads. To protect a motor from an overload, the motor nameplate full-load current is used to select the overload protection rather than the full-load current values from Tables 430.248 through 430.250, which are used to design the feeder and branch-circuit wiring.

**(2) Thermal Protector.** A thermal protector integral with the motor, approved for use with the motor it protects on the basis that it will prevent dangerous overheating of the motor due to overload and failure to start. The ultimate trip current of a thermally protected motor shall not exceed the following percentage of motor full-load current given in Table 430.248, Table 430.249, and Table 430.250:

Motor full-load current 9 amperes or less	170%
Motor full-load current from 9.1 to, and including, 20 amperes	156%
Motor full-load current greater than 20 amperes	140%

If the motor current-interrupting device is separate from the motor and its control circuit is operated by a protective device integral with the motor, it shall be arranged so that the opening of the control circuit will result in interruption of current to the motor.

**(3) Integral with Motor.** A protective device integral with a motor that will protect the motor against damage due to failure to start shall be permitted if the motor is part of an approved assembly that does not normally subject the motor to overloads.

**(4) Larger Than 1500 Horsepower.** For motors larger than 1500 hp, a protective device having embedded temperature detectors that cause current to the motor to be interrupted when the motor attains a temperature rise greater than marked on the nameplate in an ambient temperature of 40°C.

Continuous-duty-rated motors of more than 1 hp can be protected against overload conditions by any one of the following four methods, in accordance with 430.32(A):

1. An overload device located in the motor controller, such as a bimetallic element or eutectic material
2. A thermal protector, located in the motor, which senses excessive current or temperature
3. A protective device in the motor, where the motor is part of an assembly that does not normally subject the motor to overloads
4. For motors larger than 1500 hp, a temperature-sensitive device, embedded in the motor windings, that will de-energize the motor

**(B) One Horsepower or Less, Automatically Started.**

Any motor of 1 hp or less that is started automatically shall be protected against overload by one of the following means.

**(1) Separate Overload Device.** By a separate overload device following the requirements of 430.32(A)(1).

For a multispeed motor, each winding connection shall be considered separately. Modification of this value shall be permitted as provided in 430.32(C).

**(2) Thermal Protector.** A thermal protector integral with the motor, approved for use with the motor that it protects on the basis that it will prevent dangerous overheating of the motor due to overload and failure to start. Where the motor current-interrupting device is separate from the motor and its control circuit is operated by a protective device integral with the motor, it shall be arranged so that the opening of the control circuit results in interruption of current to the motor.

The thermal protector shown in Exhibit 430.8 is located inside the motor housing and is connected in series with the motor winding. It has a set of normally closed contacts attached to a bimetallic disk through which the circuit is normally closed. The thermal protector heating coil (in series with the motor winding) causes the disk to heat rapidly. The heat-actuated disk snaps the contacts open to protect the motor windings from overheating due to failure to start, a sudden heavy overload, or a prolonged overload. After the circuit opens and the motor has cooled to a normal temperature, the contacts automatically close and restart the motor, which may not be desirable in some cases. For such applications, the protective device is designed so that it must be returned to the closed position by a manually controlled reset, as required by 430.43.

For larger motors (usually over 1 hp), a similar device is used. This device, upon abnormal overload, acts as a control-

**EXHIBIT 430.8** A thermal protector for a motor, in which a heat-sensitive snap-action disk opens contacts and protects the motor in which it is mounted against dangerous overheating per 430.32(A)(2). Because of these contacts, this type of protector cannot be used with motors in a Class I, Division 2 hazardous area per 501.125(B). (Courtesy of Sensata Technologies)

circuit switch and operates the control circuit of a motor current-interrupting device, usually a motor contactor or starter, located separately from the motor. A thermal protector and circuit-interrupting device should be approved for use with the motor it protects and is required to open the circuit on an overcurrent, as specified in 430.32(A)(2).

Section 501.125 permits open induction motors in Class I, Division 2 areas if they have no arc-producing parts. Because this thermal contact is an arc-producing part, a motor with a thermal protector, unless it is listed for a Class I, Division 2 area, is prohibited from use in a Class I, Division 2 area.

**(3) Integral with Motor.** A protective device integral with a motor that protects the motor against damage due to failure to start shall be permitted (1) if the motor is part of an approved assembly that does not subject the motor to overloads, or (2) if the assembly is also equipped with other

safety controls (such as the safety combustion controls on a domestic oil burner) that protect the motor against damage due to failure to start. Where the assembly has safety controls that protect the motor, it shall be so indicated on the nameplate of the assembly where it will be visible after installation.

**(4) Impedance-Protected.** If the impedance of the motor windings is sufficient to prevent overheating due to failure to start, the motor shall be permitted to be protected as specified in 430.32(D)(2)(a) for manually started motors if the motor is part of an approved assembly in which the motor will limit itself so that it will not be dangerously overheated.

**Informational Note:** Many ac motors of less than  $\frac{1}{20}$  hp, such as clock motors, series motors, and so forth, and also some larger motors such as torque motors, come within this classification. It does not include split-phase motors having automatic switches that disconnect the starting windings.

**(C) Selection of Overload Device.** Where the sensing element or setting or sizing of the overload device selected in accordance with 430.32(A)(1) and 430.32(B)(1) is not sufficient to start the motor or to carry the load, higher size sensing elements or incremental settings or sizing shall be permitted to be used, provided the trip current of the overload device does not exceed the following percentage of motor nameplate full-load current rating:

Motors with marked service factor 1.15 or greater	140%
Motors with a marked temperature rise 40°C or less	140%
All other motors	130%

If not shunted during the starting period of the motor as provided in 430.35, the overload device shall have sufficient time delay to permit the motor to start and accelerate its load.

**Informational Note:** A Class 20 or Class 30 overload relay will provide a longer motor acceleration time than a Class 10 or Class 20, respectively. Use of a higher class overload relay may preclude the need for selection of a higher trip current.

**(D) One Horsepower or Less, Nonautomatically Started.**

**(1) Permanently Installed.** Overload protection shall be in accordance with 430.32(B).

**(2) Not Permanently Installed.**

In accordance with 430.32(D)(2), motors that are rated 1 hp or less and are not permanently installed and not automatically started, such as motors for bench grinders, drill presses, and portable electric tools, are not required to have overload

protection and may be protected by the branch-circuit short-circuit fuse or circuit breaker. This type of equipment is usually attended by the operator, who can immediately shut off power to the motor if it overheats and starts smoking.

(a) *Within Sight from Controller.* Overload protection shall be permitted to be furnished by the branch-circuit short-circuit and ground-fault protective device; such device, however, shall not be larger than that specified in Part IV of Article 430.

*Exception: Any such motor shall be permitted on a nominal 120-volt branch circuit protected at not over 20 amperes.*

(b) *Not Within Sight from Controller.* Overload protection shall be in accordance with 430.32(B).

**(E) Wound-Rotor Secondaries.** The secondary circuits of wound-rotor ac motors, including conductors, controllers, resistors, and so forth, shall be permitted to be protected against overload by the motor-overload device.

### 430.33 Intermittent and Similar Duty

A motor used for a condition of service that is inherently short-time, intermittent, periodic, or varying duty, as illustrated by Table 430.22(E), shall be permitted to be protected against overload by the branch-circuit short-circuit and ground-fault protective device, provided the protective device rating or setting does not exceed that specified in Table 430.52.

Any motor application shall be considered to be for continuous duty unless the nature of the apparatus it drives is such that the motor cannot operate continuously with load under any condition of use.

A motor used for duty-cycle service (short-time, intermittent, periodic, or varying) is permitted by 430.33 to be protected by the branch-circuit short-circuit and ground-fault protective device. Because the motor will not operate continuously due to the nature of the apparatus or machinery it drives, prolonged overloads are rare unless mechanical failure in the driven apparatus stalls the motor; in that case, the branch-circuit protective device would open the circuit. The omission of overload protective devices for such motors is based on the type of duty, not on the time rating of the motor.

### 430.35 Shunting During Starting Period

**(A) Nonautomatically Started.** For a nonautomatically started motor, the overload protection shall be permitted to be shunted or cut out of the circuit during the starting period of the motor if the device by which the overload protection

is shunted or cut out cannot be left in the starting position and if fuses or inverse time circuit breakers rated or set at not over 400 percent of the full-load current of the motor are located in the circuit so as to be operative during the starting period of the motor.

**(B) Automatically Started.** The motor overload protection shall not be shunted or cut out during the starting period if the motor is automatically started.

*Exception: The motor overload protection shall be permitted to be shunted or cut out during the starting period on an automatically started motor where the following apply:*

- (a) *The motor starting period exceeds the time delay of available motor overload protective devices, and*
- (b) *Listed means are provided to perform the following:*
  - (1) *Sense motor rotation and automatically prevent the shunting or cutout in the event that the motor fails to start, and*
  - (2) *Limit the time of overload protection shunting or cutout to less than the locked rotor time rating of the protected motor, and*
  - (3) *Provide for shutdown and manual restart if motor running condition is not reached.*

### 430.36 Fuses — In Which Conductor

Where fuses are used for motor overload protection, a fuse shall be inserted in each ungrounded conductor and also in the grounded conductor if the supply system is 3-wire, 3-phase ac with one conductor grounded.

### 430.37 Devices Other Than Fuses — In Which Conductor

Where devices other than fuses are used for motor overload protection, Table 430.37 shall govern the minimum allowable number and location of overload units such as trip coils or relays.

All 3-phase motors, except those protected by other approved means, must be provided with three overload units, one in each phase. Examples of those motors protected by other means include specially designed or integral-type detectors, with or without supplementary external protective devices. See 430.36 for instances in which fuses used as overloads are required even in the grounded conductor.

### 430.38 Number of Conductors Opened by Overload Device

Motor overload devices, other than fuses or thermal protectors, shall simultaneously open a sufficient number of ungrounded conductors to interrupt current flow to the motor.

**TABLE 430.37 Overload Units**

Kind of Motor	Supply System	Number and Location of Overload Units, Such as Trip Coils or Relays
1-phase ac or dc	2-wire, 1-phase ac or dc ungrounded	1 in either conductor
1-phase ac or dc	2-wire, 1-phase ac or dc, one conductor grounded	1 in ungrounded conductor
1-phase ac or dc	3-wire, 1-phase ac or dc, grounded neutral conductor	1 in either ungrounded conductor
1-phase ac	Any 3-phase	1 in ungrounded conductor
2-phase ac	3-wire, 2-phase ac, ungrounded	2, one in each phase
2-phase ac	3-wire, 2-phase ac, one conductor grounded	2 in ungrounded conductors
2-phase ac	4-wire, 2-phase ac, grounded or ungrounded	2, one for each phase in ungrounded conductors
2-phase ac	Grounded neutral or 5-wire, 2-phase ac, ungrounded	2, one for each phase in any ungrounded phase wire
3-phase ac	Any 3-phase	3, one in each phase*

\*Exception: An overload unit in each phase shall not be required where overload protection is provided by other approved means.

### 430.39 Motor Controller as Overload Protection

A motor controller shall also be permitted to serve as an overload device if the number of overload units complies with Table 430.37 and if these units are operative in both the starting and running position in the case of a dc motor, and in the running position in the case of an ac motor.

For the purpose of Article 430, a controller may be a switch, a circuit breaker, a contactor, or any other device that starts and stops a motor by making and breaking the motor circuit current. The controller must be capable of interrupting the stalled-rotor current of the motor and must have a horsepower rating that is not lower than the horsepower rating of the motor. Motor controllers are covered in Part VII of Article 430.

Dual-element fuses can be sized to provide motor overload protection (see 430.36). Automatically operated contac-

tors or circuit breakers (with trip units) are governed by the requirements of 430.37 and 430.38 where these devices are used to provide overload protection.

### 430.40 Overload Relays

Overload relays and other devices for motor overload protection that are not capable of opening short circuits or ground faults shall be protected by fuses or circuit breakers with ratings or settings in accordance with 430.52 or by a motor short-circuit protector in accordance with 430.52.

Some overload devices are marked with a maximum short-circuit and ground-fault protective device rating or setting. This rating sets the limit on the maximum fuse or breaker size that may be upstream from the overload device. The rating also notifies the user that coordination between the overload device and the short-circuit and ground-fault device is required, which is most often the case for group motor installation.

*Exception: Where approved for group installation and marked to indicate the maximum size of fuse or inverse time circuit breaker by which they must be protected, the overload devices shall be protected in accordance with this marking.*

Informational Note: For instantaneous trip circuit breakers or motor short-circuit protectors, see 430.52.

### 430.42 Motors on General-Purpose Branch Circuits

Overload protection for motors used on general-purpose branch circuits as permitted in Article 210 shall be provided as specified in 430.42(A), (B), (C), or (D).

**(A) Not over 1 Horsepower.** One or more motors without individual overload protection shall be permitted to be connected to a general-purpose branch circuit only where the installation complies with the limiting conditions specified in 430.32(B) and 430.32(D) and 430.53(A)(1) and (A)(2).

**(B) Over 1 Horsepower.** Motors of ratings larger than specified in 430.53(A) shall be permitted to be connected to general-purpose branch circuits only where each motor is protected by overload protection selected to protect the motor as specified in 430.32. Both the controller and the motor overload device shall be approved for group installation with the short-circuit and ground-fault protective device selected in accordance with 430.53.

**(C) Cord-and-Plug-Connected.** Where a motor is connected to a branch circuit by means of an attachment plug

and a receptacle or a cord connector, and individual overload protection is omitted as provided in 430.42(A), the rating of the attachment plug and receptacle or cord connector shall not exceed 15 amperes at 125 volts or 250 volts. Where individual overload protection is required as provided in 430.42(B) for a motor or motor-operated appliance that is attached to the branch circuit through an attachment plug and a receptacle or a cord connector, the overload device shall be an integral part of the motor or of the appliance. The rating of the attachment plug and receptacle or the cord connector shall determine the rating of the circuit to which the motor may be connected, as provided in 210.21(B).

**(D) Time Delay.** The branch-circuit short-circuit and ground-fault protective device protecting a circuit to which a motor or motor-operated appliance is connected shall have sufficient time delay to permit the motor to start and accelerate its load.

### 430.43 Automatic Restarting

A motor overload device that can restart a motor automatically after overload tripping shall not be installed unless approved for use with the motor it protects. A motor overload device that can restart a motor automatically after overload tripping shall not be installed if automatic restarting of the motor can result in injury to persons.

An integral motor overload protective device may be of the type that, after tripping and sufficiently cooling, automatically restarts the motor, or it may be of the type that, after tripping, is closed by use of a manually operated reset button. See the commentary following 430.32(B)(2).

### 430.44 Orderly Shutdown

If immediate automatic shutdown of a motor by a motor overload protective device(s) would introduce additional or increased hazard(s) to a person(s) and continued motor operation is necessary for safe shutdown of equipment or process, a motor overload sensing device(s) complying with the provisions of Part III of this article shall be permitted to be connected to a supervised alarm instead of causing immediate interruption of the motor circuit, so that corrective action or an orderly shutdown can be initiated.

## IV. Motor Branch-Circuit Short-Circuit and Ground-Fault Protection

### 430.51 General

Part IV specifies devices intended to protect the motor branch-circuit conductors, the motor control apparatus, and the motors against overcurrent due to short circuits or ground faults. These rules add to or amend the provisions of

Article 240. The devices specified in Part IV do not include the types of devices required by 210.8, 230.95, and 590.6.

The provisions of Part IV shall not apply to motor circuits rated over 600 volts, nominal.

Informational Note No. 1: For over 600 volts, nominal, see Part XI.

Informational Note No. 2: See Informative Annex D, Example D8.

### 430.52 Rating or Setting for Individual Motor Circuit

**(A) General.** The motor branch-circuit short-circuit and ground-fault protective device shall comply with 430.52(B) and either 430.52(C) or (D), as applicable.

Section 430.52(A) establishes the maximum allowable ratings or settings of devices (fuses or circuit breakers) acceptable for motor branch-circuit short-circuit and ground-fault protection and states that these devices are expected to carry the starting current of the motor and provide short-circuit and ground-fault protection. For certain exceptions to the maximum rating or setting of these motor branch-circuit protective devices, as specified in Table 430.52, see 430.52, 430.53, and 430.54.

Section 430.6 requires that if the current rating of a motor is used to determine the ampacity of conductors or ampere ratings of switches, branch-circuit overcurrent devices, and so on, the values given in Tables 430.248 through 430.250 (including notes) must be used instead of the actual motor nameplate current rating. Separate motor overload protection must be based on the motor nameplate current rating.

Exhibit 430.4 illustrates a typical motor circuit in which the branch-circuit short-circuit and ground-fault protective fuse or circuit breaker rating must carry the starting current and may be sized 150 to 300 percent of the motor full-load current (depending on the type of motor).

The rules for short-circuit and ground-fault protection are specific for particular situations. A *short circuit* is a fault between two conductors or between phases. A *ground fault* is a fault between an ungrounded conductor and ground. During a short-circuit or phase-to-ground condition, the extremely high current causes the protective fuses or circuit breakers to open the circuit. Excess current flow caused by an overload condition passes through the overload protective device at the motor controller, thereby causing the device to open the control circuit or motor circuit conductors.

Branch-circuit conductors with an ampacity of 125 percent (not 150 to 300 percent) of the motor full-load current are reasonably protected by motor-protective devices set to operate at nearly the same current as the ampacity of the conductors. Branch-circuit short-circuit and ground-fault

protective devices open the circuit under short-circuit conditions and thereby provide short-circuit and ground-fault protection for both the motor and overload protective device; however, the overload protective device is not intended to open short circuits or ground faults.

The selected rating or setting of the branch-circuit short-circuit and ground-fault protective device should be as low as possible for maximum protection. However, if the rating or setting specified in Table 430.52 or permitted by 430.52(C)(1), Exception No. 1, is not sufficient for the starting current of the motor, a higher rating or setting is allowed per 430.52(C)(1), Exception No. 2. For example, a higher rating would be allowed for a motor under severe starting conditions in which the motor and its driven machinery require an extended period of time to reach the desired speed.

**(B) All Motors.** The motor branch-circuit short-circuit and ground-fault protective device shall be capable of carrying the starting current of the motor.

**(C) Rating or Setting.**

**(1) In Accordance with Table 430.52.** A protective device that has a rating or setting not exceeding the value calculated according to the values given in Table 430.52 shall be used.

Although Class CC fuses are rated as time delay, they are permitted to be sized according to the requirements of non-time-delay-rated fuses because they are so fast acting. Examples of Class CC fuses are shown in Exhibit 430.9.

**EXHIBIT 430.9** Class CC fuses. (Courtesy of Cooper Bussmann, a division of Cooper Industries PLC)

**TABLE 430.52** Maximum Rating or Setting of Motor Branch-Circuit Short-Circuit and Ground-Fault Protective Devices

Type of Motor	Percentage of Full-Load Current			
	Nontime Delay Fuse <sup>1</sup>	Dual Element (Time-Delay) Fuse <sup>1</sup>	Instantaneous Trip Breaker	Inverse Time Breaker <sup>2</sup>
Single-phase motors	300	175	800	250
AC polyphase motors other than wound-rotor	300	175	800	250z
Squirrel cage — other than Design B energy-efficient	300	175	800	250
Design B energy-efficient	300	175	1100	250
Synchronous <sup>3</sup>	300	175	800	250
Wound rotor	150	150	800	150
Direct current (constant voltage)	150	150	250	150

Note: For certain exceptions to the values specified, see 430.54.

<sup>1</sup>The values in the Nontime Delay Fuse column apply to Time-Delay Class CC fuses.

<sup>2</sup>The values given in the last column also cover the ratings of nonadjustable inverse time types of circuit breakers that may be modified as in 430.52(C)(1), Exception No. 1 and No. 2.

<sup>3</sup>Synchronous motors of the low-torque, low-speed type (usually 450 rpm or lower), such as are used to drive reciprocating compressors, pumps, and so forth, that start unloaded, do not require a fuse rating or circuit-breaker setting in excess of 200 percent of full-load current.

*Exception No. 1: Where the values for branch-circuit short-circuit and ground-fault protective devices determined by Table 430.52 do not correspond to the standard sizes or ratings of fuses, nonadjustable circuit breakers, thermal protective devices, or possible settings of adjustable circuit breakers, a higher size, rating, or possible setting that does not exceed the next higher standard ampere rating shall be permitted.*

*Exception No. 2: Where the rating specified in Table 430.52, or the rating modified by Exception No. 1, is not sufficient for the starting current of the motor:*

- (a) *The rating of a nontime-delay fuse not exceeding 600 amperes or a time-delay Class CC fuse shall be permitted to be increased but shall in no case exceed 400 percent of the full-load current.*

- (b) The rating of a time-delay (dual-element) fuse shall be permitted to be increased but shall in no case exceed 225 percent of the full-load current.
- (c) The rating of an inverse time circuit breaker shall be permitted to be increased but shall in no case exceed 400 percent for full-load currents of 100 amperes or less or 300 percent for full-load currents greater than 100 amperes.
- (d) The rating of a fuse of 601–6000 ampere classification shall be permitted to be increased but shall in no case exceed 300 percent of the full-load current.

Informational Note: See Informative Annex D, Example D8, and Figure 430.1.

**(2) Overload Relay Table.** Where maximum branch-circuit short-circuit and ground-fault protective device ratings are shown in the manufacturer's overload relay table for use with a motor controller or are otherwise marked on the equipment, they shall not be exceeded even if higher values are allowed as shown above.

**(3) Instantaneous Trip Circuit Breaker.** An instantaneous trip circuit breaker shall be used only if adjustable and if part of a listed combination motor controller having coordinated motor overload and short-circuit and ground-fault protection in each conductor, and the setting is adjusted to no more than the value specified in Table 430.52.

Informational Note: For the purpose of this article, instantaneous trip circuit breakers may include a damping means to accommodate a transient motor inrush current without nuisance tripping of the circuit breaker.

*Exception No. 1: Where the setting specified in Table 430.52 is not sufficient for the starting current of the motor, the setting of an instantaneous trip circuit breaker shall be permitted to be increased but shall in no case exceed 1300 percent of the motor full-load current for other than Design B energy-efficient motors and no more than 1700 percent of full-load motor current for Design B energy-efficient motors. Trip settings above 800 percent for other than Design B energy-efficient motors and above 1100 percent for Design B energy-efficient motors shall be permitted where the need has been demonstrated by engineering evaluation. In such cases, it shall not be necessary to first apply an instantaneous-trip circuit breaker at 800 percent or 1100 percent.*

Informational Note: For additional information on the requirements for a motor to be classified "energy efficient," see NEMA Standards Publication No. MG1-1993, Revision, *Motors and Generators*, Part 12.59.

*Exception No. 2: Where the motor full-load current is 8 amperes or less, the setting of the instantaneous-trip circuit breaker with a continuous current rating of 15 amperes or less in a listed combination motor controller that provides*

*coordinated motor branch-circuit overload and short-circuit and ground-fault protection shall be permitted to be increased to the value marked on the controller.*

**(4) Multispeed Motor.** For a multispeed motor, a single short-circuit and ground-fault protective device shall be permitted for two or more windings of the motor, provided the rating of the protective device does not exceed the above applicable percentage of the nameplate rating of the smallest winding protected.

*Exception: For a multispeed motor, a single short-circuit and ground-fault protective device shall be permitted to be used and sized according to the full-load current of the highest current winding, where all of the following conditions are met:*

- (a) *Each winding is equipped with individual overload protection sized according to its full-load current.*
- (b) *The branch-circuit conductors supplying each winding are sized according to the full-load current of the highest full-load current winding.*
- (c) *The controller for each winding has a horsepower rating not less than that required for the winding having the highest horsepower rating.*

**(5) Power Electronic Devices.** Suitable fuses shall be permitted in lieu of devices listed in Table 430.52 for power electronic devices in a solid-state motor controller system, provided that the marking for replacement fuses is provided adjacent to the fuses.

**(6) Self-Protected Combination Controller.** A listed self-protected combination controller shall be permitted in lieu of the devices specified in Table 430.52. Adjustable instantaneous-trip settings shall not exceed 1300 percent of full-load motor current for other than Design B energy-efficient motors and not more than 1700 percent of full-load motor current for Design B energy-efficient motors.

A self-protected combination controller combines the functions of short-circuit protection, disconnect, controller, and overload protection into a single unit. Only listed units are permitted; therefore, they must be applied within their ratings.

Informational Note: Proper application of self-protected combination controllers on 3-phase systems, other than solidly grounded wye, particularly on corner grounded delta systems, considers the self-protected combination controllers' individual pole-interrupting capability.

**(7) Motor Short-Circuit Protector.** A motor short-circuit protector shall be permitted in lieu of devices listed in Table

430.52 if the motor short-circuit protector is part of a listed combination motor controller having coordinated motor overload protection and short-circuit and ground-fault protection in each conductor and it will open the circuit at currents exceeding 1300 percent of motor full-load current for other than Design B energy-efficient motors and 1700 percent of motor full-load motor current for Design B energy-efficient motors.

**Informational Note:** A motor short-circuit protector, as used in this section, is a fused device and is not an instantaneous trip circuit breaker.

**(D) Torque Motors.** Torque motor branch circuits shall be protected at the motor nameplate current rating in accordance with 240.4(B).

### 430.53 Several Motors or Loads on One Branch Circuit

Two or more motors or one or more motors and other loads shall be permitted to be connected to the same branch circuit under conditions specified in 430.53(D) and in 430.53(A), (B), or (C). The branch-circuit protective device shall be fuses or inverse time circuit breakers.

This section was revised for the 2011 *Code* to clarify that inverse time circuit breakers and fuses are the only permitted means for providing group motor branch short-circuit and ground-fault protection.

**(A) Not Over 1 Horsepower.** Several motors, each not exceeding 1 hp in rating, shall be permitted on a nominal 120-volt branch circuit protected at not over 20 amperes or a branch circuit of 600 volts, nominal, or less, protected at not over 15 amperes, if all of the following conditions are met:

- (1) The full-load rating of each motor does not exceed 6 amperes.
- (2) The rating of the branch-circuit short-circuit and ground-fault protective device marked on any of the controllers is not exceeded.
- (3) Individual overload protection conforms to 430.32.

Two or more motors or one or more motors and other loads may be connected to the same 120-volt, 15- or 20-ampere, single-phase lighting circuit as long as each motor is rated not more than 1 hp, the full-load rating of each motor does not exceed 6 amperes, and the rating of the branch-circuit protective device is not exceeded.

The requirements for overload protection, as provided in 430.32, must be applied in all cases, regardless of the number (one or more) of motors or the type of branch circuit.

**(B) If Smallest Rated Motor Protected.** If the branch-circuit short-circuit and ground-fault protective device is selected not to exceed that allowed by 430.52 for the smallest rated motor, two or more motors or one or more motors and other load(s), with each motor having individual overload protection, shall be permitted to be connected to a branch circuit where it can be determined that the branch-circuit short-circuit and ground-fault protective device will not open under the most severe normal conditions of service that might be encountered.

**(C) Other Group Installations.** Two or more motors of any rating or one or more motors and other load(s), with each motor having individual overload protection, shall be permitted to be connected to one branch circuit where the motor controller(s) and overload device(s) are (1) installed as a listed factory assembly and the motor branch-circuit short-circuit and ground-fault protective device either is provided as part of the assembly or is specified by a marking on the assembly, or (2) the motor branch-circuit short-circuit and ground-fault protective device, the motor controller(s), and overload device(s) are field-installed as separate assemblies listed for such use and provided with manufacturers' instructions for use with each other, and (3) all of the following conditions are complied with:

- (1) Each motor overload device is either (a) listed for group installation with a specified maximum rating of fuse, inverse time circuit breaker, or both, or (b) selected such that the ampere rating of the motor-branch short-circuit and ground-fault protective device does not exceed that permitted by 430.52 for that individual motor overload device and corresponding motor load.
- (2) Each motor controller is either (a) listed for group installation with a specified maximum rating of fuse, circuit breaker, or both, or (b) selected such that the ampere rating of the motor-branch short-circuit and ground-fault protective device does not exceed that permitted by 430.52 for that individual controller and corresponding motor load.
- (3) Each circuit breaker is listed and is of the inverse time type.
- (4) The branch circuit shall be protected by fuses or inverse time circuit breakers having a rating not exceeding that specified in 430.52 for the highest rated motor connected to the branch circuit plus an amount equal to the sum of the full-load current ratings of all other motors and the ratings of other loads connected to the circuit. Where this calculation results in a rating less than the ampacity of the supply conductors, it shall be permitted to increase the maximum rating of the fuses or circuit breaker to a value not exceeding that permitted by 240.4(B).
- (5) The branch-circuit fuses or inverse time circuit breakers are not larger than allowed by 430.40 for the overload relay protecting the smallest rated motor of the group.

- (6) Overcurrent protection for loads other than motor loads shall be in accordance with Parts I through VII of Article 240.

Item (6) of 430.53(C) clarifies that in group installations, where there are other loads that are not motor loads, the other loads must be provided with overcurrent protection in accordance with Part I through Part VII of Article 240. The ground-fault short-circuit protection for motors might be greater than is permitted for other loads in accordance with Article 240. Section 110.10 addresses characteristics of components such as impedance and short-circuit current ratings. Devices with the same ampere rating may have significantly different short-circuit current ratings. Proper selection of components includes consideration of the characteristics of all components so that a fault will not cause unacceptable damage.

This section was revised for the 2011 *Code*. Previously, this section required all motor controllers and overload devices to be listed for group installation. As revised, the section requires that any motor controller or overload device applied within a group installation where the branch-circuit protection for the group is sized within what would be permitted for a single motor installation of that device need not be marked for group motor installation, since it is protected within its listing requirements.

Informational Note: See 110.10 for circuit impedance and other characteristics.

**(D) Single Motor Taps.** For group installations described above, the conductors of any tap supplying a single motor shall not be required to have an individual branch-circuit short-circuit and ground-fault protective device, provided they comply with one of the following:

- (1) No conductor to the motor shall have an ampacity less than that of the branch-circuit conductors.
- (2) No conductor to the motor shall have an ampacity less than one-third that of the branch-circuit conductors, with a minimum in accordance with 430.22, the conductors to the motor overload device being not more than 7.5 m (25 ft) long and being protected from physical damage by being enclosed in an approved raceway or by use of other approved means.
- (3) Conductors from the branch-circuit short-circuit and ground-fault protective device to a listed manual motor controller additionally marked “Suitable for Tap Conductor Protection in Group Installations,” or to a branch-circuit protective device, shall be permitted to have an ampacity not less than one-tenth the rating or setting of the branch-circuit short-circuit and ground-fault protective device. The conductors from the controller to the motor shall have an ampacity in accordance with 430.22. The conductors from the branch-circuit short-circuit and ground-fault protective device to the controller shall (1) be suitably protected from physical damage and enclosed either by an enclosed controller or by a raceway and be not more than 3 m (10 ft) long or (2) have an ampacity not less than that of the branch-circuit conductors.

For the group motor applications covered in 430.53(C), the provisions of 430.53(D)(3) add a third alternative for tapping a branch circuit to supply a single motor. The conditions for applying this tap rule are similar to those in 430.28 covering motor supply conductors tapped to a feeder. The short-circuit ground-fault device on the line side of the tap conductors is protecting more than one set of conductors that supply individual motors, thus eliminating the need for an individual short-circuit ground-fault device for each set of conductors that supply a motor. Additional branch-circuit protective devices (such as fuses, inverse time circuit breakers, and listed self-protected combination motor controllers) may be used in the same location in the circuit of a group installation as a manual motor controller additionally marked “Suitable for Tap Conductor Protection in Group Installations.”

This approach requires that the tap conductors meet certain size, physical protection, length, and termination conditions. The tap conductors always have to meet the conductor size requirements of 430.22 and must have an ampacity not less than one-tenth the rating of the upstream short-circuit ground-fault protective device. Where the conductors are sized according to this provision, their length cannot exceed 10 ft, and they have to be enclosed in a raceway or by the motor controller. If the conductor ampacity is not less than the rating of the upstream short-circuit ground-fault protective device, the length of the conductor is not limited.

The tap conductors are permitted to terminate in a listed manual motor controller that is marked “Suitable for Tap Conductor Protection in Group Installations.” This controller provides an instantaneous trip mechanism, motor overload protection, and provisions for disconnecting the motor.

Exhibit 430.10 illustrates main branch-circuit conductors supplying a motor that is part of a group installation. The tap conductors have an ampacity equal to the ampacity of the main branch-circuit conductors. Therefore, branch-circuit short-circuit and ground-fault protective devices, fuses, or circuit breakers for the conductors in the tap are not required at the point of connection of the tap conductors to the main conductors, provided that the motor controller and motor overload protective device are listed for group installation with the size of the main branch-circuit short-circuit and ground-fault protective device used.

Exhibit 430.11 also illustrates main branch-circuit conductors supplying a motor that is part of a group installation.

**EXHIBIT 430.10** An example of the permissible omission of motor branch-circuit protective devices for tap conductors that have the same ampacity as the main conductors per 430.53(D)(1).

**EXHIBIT 430.11** An example of the permissible omission of motor branch-circuit protective devices for tap conductors that have at least one-third the ampacity of the main conductors, are not over 25 ft long, and are protected from physical damage per 430.53(D)(2).

Here, the tap conductors have an ampacity at least one-third the ampacity of the main branch-circuit conductors, are not more than 25 ft in length, and are suitably protected from physical damage. The motor controller and motor overload protective device must be listed for group installation with the size of the main branch-circuit short-circuit and ground-fault protective device used.

In both examples, the main branch-circuit fuses or circuit breakers would operate in the event of a short circuit, and the overload protective device would operate to protect the motor and tap conductors under overload conditions.

The tap conductors should never be of a smaller size and ampacity than the branch-circuit conductors required by 430.22. That is, a tap conductor (25 ft or less) may be one-third the ampacity of the main branch-circuit conductor to which it is connected; however, this ampacity must be equal to or larger than 125 percent of the motor's full-load current rating (see 430.22).

#### Calculation Example

A 25-hp, 230-volt, 3-phase squirrel-cage motor is to be supplied from a branch circuit that has 2/0 AWG THW copper conductors, which typically have an ampacity of 175 amperes. See Table 310.15(B)(16). Determine the correct size for the tap conductors.

#### Solution

A tap conductor (25 ft or less) would normally be permitted to be sized at 6 AWG THW copper (65 amperes). But one-third of 175 amperes is 58 amperes, and the motor circuit conductors must have an ampacity of at least 85 amperes. A 6 AWG tap conductor would not meet the requirements of 430.22. That is, 125 percent of the full-load current of the motor (68 amperes from Table 430.250) is 85 amperes ( $1.25 \times 68 \text{ amperes} = 85 \text{ amperes}$ ). Therefore, the branch-circuit tap conductors are not permitted to be smaller than 4 AWG THW copper, with a normal ampacity of 85 amperes. See Table 310.15(B)(16).

Note that the ampacities in Table 310.15(B)(16) are reduced for ambient temperatures above 30°C and for more than three conductors in the raceway or cable.

### 430.54 Multimotor and Combination-Load Equipment

The rating of the branch-circuit short-circuit and ground-fault protective device for multimotor and combination-load equipment shall not exceed the rating marked on the equipment in accordance with 430.7(D).

### 430.55 Combined Overcurrent Protection

Motor branch-circuit short-circuit and ground-fault protection and motor overload protection shall be permitted to be combined in a single protective device where the rating or

setting of the device provides the overload protection specified in 430.32.

Either a circuit breaker with inverse time characteristics or a dual-element (time-delay) fuse is permitted by 430.55 to serve both as motor overload protection and as the branch-circuit short-circuit and ground-fault protection if the provisions of 430.32 are met. These devices are not permitted to be sized as overload protection according to the values of 430.32(C). Rather, fuses are permitted to be sized as overload protection only according to the values found in 430.32(A)(1), 430.32(B)(1), and 430.32(D)(1).

One-time, time-delay dual-element and Type S dual-element fuses and adapters are available with up to a 30-ampere rating. Type S fuses are designed to prevent oversize fusing. See 240.50 through 240.54 for more information about these fuses and adapters.

Exhibits 430.12 and 430.13 are examples of time-delay, cartridge-type dual-element fuses that are able to withstand the normal motor starting current if sized at or near the motor full-load rating but that open when subjected to prolonged overload or blow quickly during a short circuit or ground fault. The dual-element characteristics are the thermal cutout element, which permits harmless high-inrush currents to flow for short periods (but which would open the circuit during a prolonged period), and the fuse link element, which has current-limiting ability for short-circuit currents (and which would blow quickly). Dual-element fuses may be used in larger sizes to provide only short-circuit and ground-fault protection.

**EXHIBIT 430.12** Fusetron cartridge-type fuses. (Courtesy of Cooper Bussmann, a division of Cooper Industries PLC)

### 430.56 Branch-Circuit Protective Devices — In Which Conductor

Branch-circuit protective devices shall comply with the provisions of 240.15.

### 430.57 Size of Fuseholder

Where fuses are used for motor branch-circuit short-circuit and ground-fault protection, the fuseholders shall not be of a

**EXHIBIT 430.13** A fuse block rejection pin (red arrow), which ensures that circuit protection will be afforded by only fuses providing a specific level of overcurrent protection. (Courtesy of Cooper Bussmann, a division of Cooper Industries PLC)

smaller size than required to accommodate the fuses specified by Table 430.52.

*Exception: Where fuses having time delay appropriate for the starting characteristics of the motor are used, it shall be permitted to use fuseholders sized to fit the fuses that are used.*

The use of dual-element (time-delay) fuses makes it possible to use smaller fuses, thereby providing better protection because of the smaller fuses' lower ratings. Dual-element fuses also save in installation cost by allowing smaller-size switches and panels, and they allow for easier arrangement of equipment where space is at a premium at motor control centers.

### 430.58 Rating of Circuit Breaker

A circuit breaker for motor branch-circuit short-circuit and ground-fault protection shall have a current rating in accordance with 430.52 and 430.110.

## V. Motor Feeder Short-Circuit and Ground-Fault Protection

### 430.61 General

Part V specifies protective devices intended to protect feeder conductors supplying motors against overcurrents due to short circuits or grounds.

Informational Note: See Informative Annex D, Example D8.

### 430.62 Rating or Setting — Motor Load

**(A) Specific Load.** A feeder supplying a specific fixed motor load(s) and consisting of conductor sizes based on 430.24 shall be provided with a protective device having a rating or setting not greater than the largest rating or setting of the branch-circuit short-circuit and ground-fault protective device for any motor supplied by the feeder [based on the maximum permitted value for the specific type of a protective device in accordance with 430.52, or 440.22(A) for hermetic refrigerant motor-compressors], plus the sum of the full-load currents of the other motors of the group.

Where the same rating or setting of the branch-circuit short-circuit and ground-fault protective device is used on two or more of the branch circuits supplied by the feeder, one of the protective devices shall be considered the largest for the above calculations.

The rating of a motor feeder short-circuit ground-fault protective device is determined by adding the rating of the largest branch-circuit short-circuit and ground-fault protective device for any motor supplied by the feeder to the sum of the full-load currents of all of the other motors supplied by that feeder. The largest branch-circuit short-circuit and ground-fault protective device is based on 430.52 and Table 430.52. The largest rating can be based on either of the exceptions to 430.52(C)(1). For the purposes of sizing the feeder protective device, it is assumed that the same type of protective device is being used for the feeder and the branch circuits. This assumption is necessary if the feeder protective device and the largest branch-circuit protective device are different types; for example, one is a fuse and the other is a circuit breaker.

Section 430.62(A) recognizes the lower setting for motor overload devices that is required for hermetic refrigerant motor-compressors.

*Exception No. 1: Where one or more instantaneous trip circuit breakers or motor short-circuit protectors are used for motor branch-circuit short-circuit and ground-fault protection as permitted in 430.52(C), the procedure provided above for determining the maximum rating of the feeder protective device shall apply with the following provision: For the purpose of the calculation, each instantaneous trip circuit breaker or motor short-circuit protector shall be assumed to have a rating not exceeding the maximum percentage of motor full-load current permitted by Table 430.52 for the type of feeder protective device employed.*

*Exception No. 2: Where the feeder overcurrent protective device also provides overcurrent protection for a motor control center, the provisions of 430.94 shall apply.*

Informational Note: See Informative Annex D, Example D8.

**(B) Other Installations.** Where feeder conductors have an ampacity greater than required by 430.24, the rating or setting of the feeder overcurrent protective device shall be permitted to be based on the ampacity of the feeder conductors.

For motor feeder conductors sized larger than the minimum required, 430.62(B) permits the size of the overcurrent device for the feeder to be based on the size of the feeder conductors.

Exception No. 2 to 430.62(A) correlates the requirement of 430.62(B) for determining feeder short-circuit ground-fault protection with the requirements of 430.94 covering overcurrent protection for motor control centers. Where the motor feeder short-circuit ground-fault protective device is also the overcurrent protective device for a motor control center, its rating cannot exceed that allowed for protecting the common power bus of the motor control center.

### 430.63 Rating or Setting — Motor Load and Other Load(s)

Where a feeder supplies a motor load and other load(s), the feeder protective device shall have a rating not less than that required for the sum of the other load(s) plus the following:

- (1) For a single motor, the rating permitted by 430.52
- (2) For a single hermetic refrigerant motor-compressor, the rating permitted by 440.22
- (3) For two or more motors, the rating permitted by 430.62

*Exception: Where the feeder overcurrent device provides the overcurrent protection for a motor control center, the provisions of 430.94 shall apply.*

See the commentary following 430.62(B).

## VI. Motor Control Circuits

### 430.71 General

Part VI contains modifications of the general requirements and applies to the particular conditions of motor control circuits.

Informational Note: See 430.9(B) for equipment device terminal requirements.

### 430.72 Overcurrent Protection

**(A) General.** A motor control circuit tapped from the load side of a motor branch-circuit short-circuit and ground-fault protective device(s) and functioning to control the motor(s)

connected to that branch circuit shall be protected against overcurrent in accordance with 430.72. Such a tapped control circuit shall not be considered to be a branch circuit and shall be permitted to be protected by either a supplementary or branch-circuit overcurrent protective device(s). A motor control circuit other than such a tapped control circuit shall be protected against overcurrent in accordance with 725.43 or the notes to Table 11(A) and Table 11(B) in Chapter 9, as applicable.

**(B) Conductor Protection.** The overcurrent protection for conductors shall be provided as specified in 430.72(B)(1) or (B)(2).

*Exception No. 1: Where the opening of the control circuit would create a hazard as, for example, the control circuit of a fire pump motor, and the like, conductors of control circuits shall require only short-circuit and ground-fault protection and shall be permitted to be protected by the motor branch-circuit short-circuit and ground-fault protective device(s).*

*Exception No. 2: Conductors supplied by the secondary side of a single-phase transformer having only a two-wire (single-voltage) secondary shall be permitted to be protected by overcurrent protection provided on the primary (supply) side of the transformer, provided this protection does not exceed the value determined by multiplying the appropriate maximum rating of the overcurrent device for the secondary conductor from Table 430.72(B) by the secondary-to-primary voltage ratio. Transformer secondary conductors (other than two-wire) shall not be considered to be protected by the primary overcurrent protection.*

**(1) Separate Overcurrent Protection.** Where the motor branch-circuit short-circuit and ground-fault protective device does not provide protection in accordance with 430.72(B)(2), separate overcurrent protection shall be provided. The overcurrent protection shall not exceed the values specified in Column A of Table 430.72(B).

**(2) Branch-Circuit Overcurrent Protective Device.** Conductors shall be permitted to be protected by the motor branch-circuit short-circuit and ground-fault protective device and shall require only short-circuit and ground-fault protection. Where the conductors do not extend beyond the motor control equipment enclosure, the rating of the protective device(s) shall not exceed the value specified in Column B of Table 430.72(B). Where the conductors extend beyond the motor control equipment enclosure, the rating of the protective device(s) shall not exceed the value specified in Column C of Table 430.72(B).

**(C) Control Circuit Transformer.** Where a motor control circuit transformer is provided, the transformer shall be protected in accordance with 430.72(C)(1), (C)(2), (C)(3), (C)(4), or (C)(5).

*Exception: Overcurrent protection shall be omitted where the opening of the control circuit would create a hazard as, for example, the control circuit of a fire pump motor and the like.*

**(1) Compliance with Article 725.** Where the transformer supplies a Class 1 power-limited circuit, Class 2, or Class 3 remote-control circuit complying with the requirements of Article 725, protection shall comply with Article 725.

**TABLE 430.72(B) Maximum Rating of Overcurrent Protective Device in Amperes**

Control Circuit Conductor Size (AWG)	Protection Provided by Motor Branch-Circuit Protective Device(s)					
	Column A Separate Protection Provided		Column B Conductors Within Enclosure		Column C Conductors Extend Beyond Enclosure	
	Copper	Aluminum or Copper-Clad Aluminum	Copper	Aluminum or Copper-Clad Aluminum	Copper	Aluminum or Copper-Clad Aluminum
18	7	—	25	—	7	—
16	10	—	40	—	10	—
14	(Note 1)	—	100	—	45	—
12	(Note 1)	(Note 1)	120	100	60	45
10	(Note 1)	(Note 1)	160	140	90	75
Larger than 10	(Note 1)	(Note 1)	(Note 2)	(Note 2)	(Note 3)	(Note 3)

Notes:

- Value specified in 310.15 as applicable.
- 400 percent of value specified in Table 310.15(B)(17) for 60°C conductors.
- 300 percent of value specified in Table 310.15(B)(16) for 60°C conductors.

(2) **Compliance with Article 450.** Protection shall be permitted to be provided in accordance with 450.3.

(3) **Less Than 50 Volt-Amperes.** Control circuit transformers rated less than 50 volt-amperes (VA) and that are an integral part of the motor controller and located within the motor controller enclosure shall be permitted to be protected by primary overcurrent devices, impedance limiting means, or other inherent protective means.

(4) **Primary Less Than 2 Amperes.** Where the control circuit transformer rated primary current is less than 2 amperes, an overcurrent device rated or set at not more than 500 percent of the rated primary current shall be permitted in the primary circuit.

(5) **Other Means.** Protection shall be permitted to be provided by other approved means.

Motor control circuits are allowed to receive their power either from the load side of the motor short-circuit and ground-fault protective device or from a separate source, such as a panelboard.

Motor control circuits that receive their power from a separate source are protected against overcurrent in accordance with 725.43 for Class 1 circuits. Conductor sizes 14 AWG and larger are protected according to their ampacity listed in Tables 310.15(B)(16) through 310.15(B)(20). Conductor sizes 16 and 18 AWG must be protected at not more than 10 and 7 amperes, respectively, as specified in Table 430.72(B).

If a motor control circuit is tapped from the load side of the motor branch-circuit short-circuit and ground-fault protective device, the size of the tapped conductor and the rating of the overcurrent device are based on whether the conductor stays within the motor control enclosure or leaves it. The load on a motor control circuit is similar to a motor branch-circuit load in that there is a predetermined connected load. There is also an initial high inrush of current, until the armature of the relay is seated and the current decreases to a steady state. Therefore, the overcurrent protection is similar to the short-circuit and ground-fault protection provided for a motor and is allowed to be greater than the ampacity of the control circuit conductor.

### 430.73 Protection of Conductors from Physical Damage

Where damage to a motor control circuit would constitute a hazard, all conductors of such a remote motor control circuit that are outside the control device itself shall be installed in a raceway or be otherwise protected from physical damage.

If damage to the motor control circuit conductors would constitute a fire or accident hazard, physical protection of the motor control circuit conductors is extremely important. If damage to the control circuit conductors could result in an accidental ground fault or short circuit, causing the device to operate or rendering the device inoperative (either condition constituting a hazard to persons or property), conductors must be installed in a raceway. Where boilers or furnaces are equipped with an automatic safety control device, damage to the conductors of the low-voltage control circuit (for example, a thermostat) does not constitute a hazard (see Article 725, Part III).

### 430.74 Electrical Arrangement of Control Circuits

Where one conductor of the motor control circuit is grounded, the motor control circuit shall be arranged so that a ground fault in the control circuit remote from the motor controller will (1) not start the motor and (2) not bypass manually operated shutdown devices or automatic safety shutdown devices.

The inadvertent grounding of control circuits is a significant safety issue. Section 430.74 requires that if one side of the motor control circuit is grounded, the circuit must be arranged so that a ground fault in the remote-control device will not start the motor. For example, in the control wiring illustrated in Exhibit 430.14, the control circuit is a 120-volt, single-phase circuit derived from a 208-volt, 3-phase wye system supplying the motor, and one side of the control circuit is the grounded neutral. If the start button of the motor control circuit is connected to the grounded neutral, a ground fault on the coil side of the start button can start the motor. As shown in Exhibit 430.15, the same condition exists if the ground fault is in the wiring rather than in the control device itself. This hazardous condition can be alleviated by locating the start button in the ungrounded side of the control circuit as shown in the correct arrangement in Exhibit 430.15.

Combinations of ground faults in motor and motor control circuits can also result in inadvertent motor starting. If the circuit is ungrounded, the first fault may go undetected. One solution is to use double-pole control devices, with one pole in each of the two control lines.

### 430.75 Disconnection

(A) **General.** Motor control circuits shall be arranged so that they will be disconnected from all sources of supply when the disconnecting means is in the open position. The disconnecting means shall be permitted to consist of two or more separate devices, one of which disconnects the motor and the controller from the source(s) of power supply for the

Incorrect

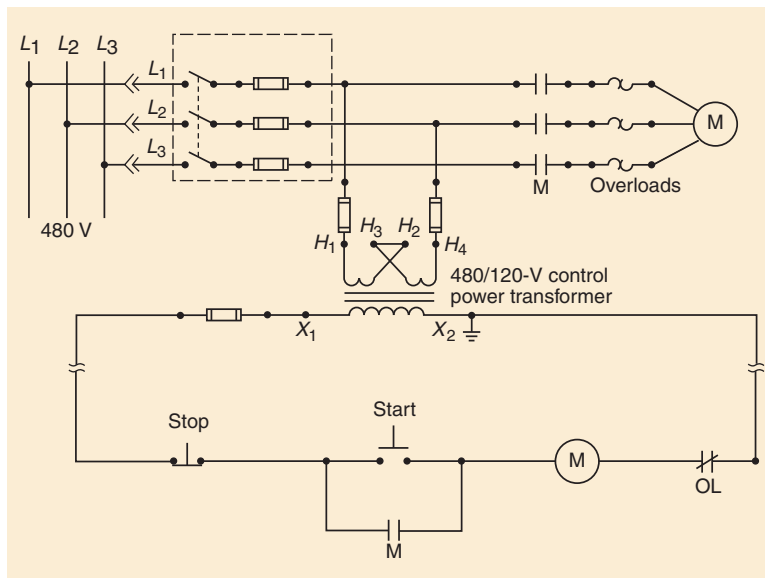

Correct

**EXHIBIT 430.14** An example of control wiring in violation of 430.74 (incorrect, left), and in compliance with 430.74 (correct, right). (For simplification, motor overload elements and disconnecting means are not shown.)

**EXHIBIT 430.15** An example of control wiring using a 480/120-volt control power transformer. (The upper control circuit is not in compliance with 430.74.)

Incorrect

Correct

motor, and the other(s), the motor control circuit(s) from its power supply. Where separate devices are used, they shall be located immediately adjacent to each other.

*Exception No. 1: Where more than 12 motor control circuit conductors are required to be disconnected, the disconnecting means shall be permitted to be located other than immediately adjacent to each other where all of the following conditions are complied with:*

- (a) Access to energized parts is limited to qualified persons in accordance with Part XI of this article.
- (b) A warning sign is permanently located on the outside of each equipment enclosure door or cover permitting access to the live parts in the motor control circuit(s), warning that motor control circuit disconnecting means are remotely located and specifying the location and identification of each disconnect. Where energized parts are not in an equipment enclosure as permitted by 430.232 and 430.233, an additional warning sign(s) shall be located where visible to persons who may be working in the area of the energized parts.

*Exception No. 2: The motor control circuit disconnecting means shall be permitted to be remote from the motor controller power supply disconnecting means where the opening of one or more motor control circuit disconnecting means is capable of resulting in potentially unsafe conditions for personnel or property and the conditions of items (a) and (b) of Exception No. 1 are complied with.*

#### **(B) Control Transformer in Controller Enclosure.**

Where a transformer or other device is used to obtain a reduced voltage for the motor control circuit and is located in the controller enclosure, such transformer or other device shall be connected to the load side of the disconnecting means for the motor control circuit.

## **VII. Motor Controllers**

### **430.81 General**

Part VII is intended to require suitable controllers for all motors.

**(A) Stationary Motor of  $\frac{1}{8}$  Horsepower or Less.** For a stationary motor rated at  $\frac{1}{8}$  hp or less that is normally left running and is constructed so that it cannot be damaged by overload or failure to start, such as clock motors and the like, the branch-circuit disconnecting means shall be permitted to serve as the controller.

**(B) Portable Motor of  $\frac{1}{3}$  Horsepower or Less.** For a portable motor rated at  $\frac{1}{3}$  hp or less, the controller shall be permitted to be an attachment plug and receptacle or cord connector.

### **430.82 Controller Design**

**(A) Starting and Stopping.** Each controller shall be capable of starting and stopping the motor it controls and shall be capable of interrupting the locked-rotor current of the motor.

**(B) Autotransformer.** An autotransformer starter shall provide an “off” position, a running position, and at least one starting position. It shall be designed so that it cannot rest in the starting position or in any position that will render the overload device in the circuit inoperative.

**(C) Rheostats.** Rheostats shall be in compliance with the following:

- (1) Motor-starting rheostats shall be designed so that the contact arm cannot be left on intermediate segments. The point or plate on which the arm rests when in the starting position shall have no electrical connection with the resistor.
- (2) Motor-starting rheostats for dc motors operated from a constant voltage supply shall be equipped with automatic devices that will interrupt the supply before the speed of the motor has fallen to less than one-third its normal rate.

### **430.83 Ratings**

The controller shall have a rating as specified in 430.83(A), unless otherwise permitted in 430.83(B) or (C), or as specified in (D), under the conditions specified.

#### **(A) General.**

**(1) Horsepower Ratings.** Controllers, other than inverse time circuit breakers and molded case switches, shall have horsepower ratings at the application voltage not lower than the horsepower rating of the motor.

**(2) Circuit Breaker.** A branch-circuit inverse time circuit breaker rated in amperes shall be permitted as a controller for all motors. Where this circuit breaker is also used for overload protection, it shall conform to the appropriate provisions of this article governing overload protection.

**(3) Molded Case Switch.** A molded case switch rated in amperes shall be permitted as a controller for all motors.

A molded case switch has the same frame appearance as a molded case circuit breaker and is designed to fit in circuit-breaker enclosures. However, where the device is marked with only a short-circuit current withstand rating, this rating indicates that the switch does not provide overcurrent protection. Those fused molded case switches that do provide overcurrent protection are marked with a short-circuit

current interrupting rating. Both fused and unfused molded case switches can be used in motor circuits.

Molded case switches are permitted as motor disconnecting means per 430.109. In general, molded case switches are rated only in amperes and, where used in a motor circuit, must be sized at 115 percent of the motor full-load current rating. Disconnecting means assemblies are available that employ molded case switches marked with horsepower ratings that can be used instead of the ampere rating of the molded case switch.

**(B) Small Motors.** Devices as specified in 430.81(A) and (B) shall be permitted as a controller.

**(C) Stationary Motors of 2 Horsepower or Less.** For stationary motors rated at 2 hp or less and 300 volts or less, the controller shall be permitted to be either of the following:

- (1) A general-use switch having an ampere rating not less than twice the full-load current rating of the motor
- (2) On ac circuits, a general-use snap switch suitable only for use on ac (not general-use ac–dc snap switches) where the motor full-load current rating is not more than 80 percent of the ampere rating of the switch

**(D) Torque Motors.** For torque motors, the controller shall have a continuous-duty, full-load current rating not less than the nameplate current rating of the motor. For a motor controller rated in horsepower but not marked with the foregoing current rating, the equivalent current rating shall be determined from the horsepower rating by using Table 430.247, Table 430.248, Table 430.249, or Table 430.250.

**(E) Voltage Rating.** A controller with a straight voltage rating, for example, 240 volts or 480 volts, shall be permitted to be applied in a circuit in which the nominal voltage between any two conductors does not exceed the controller's voltage rating. A controller with a slash rating, for example, 120/240 volts or 480Y/277 volts, shall only be applied in a solidly grounded circuit in which the nominal voltage to ground from any conductor does not exceed the lower of the two values of the controller's voltage rating and the nominal voltage between any two conductors does not exceed the higher value of the controller's voltage rating.

Section 430.83(E) requires that controllers identified with slash voltage ratings, such as 120/240-volt and 480/277-volt grounded systems, be used only on electrical systems in which the nominal voltage to ground does not exceed the lower voltage rating of the controller, and where the nominal voltage between any two phases of the electrical system is not greater than the higher value of the controller voltage rating.

### 430.84 Need Not Open All Conductors

The controller shall not be required to open all conductors to the motor.

*Exception: Where the controller serves also as a disconnecting means, it shall open all ungrounded conductors to the motor as provided in 430.111.*

A controller that does not also serve as a disconnecting means must open only as many motor circuit conductors as may be necessary to stop the motor — that is, one conductor for a dc or single-phase motor circuit, two conductors for a 3-phase motor circuit, and three conductors for a 2-phase motor circuit.

### 430.85 In Grounded Conductors

One pole of the controller shall be permitted to be placed in a permanently grounded conductor, provided the controller is designed so that the pole in the grounded conductor cannot be opened without simultaneously opening all conductors of the circuit.

Generally, one conductor of a 120-volt circuit is grounded, and a single-pole device must be connected in the ungrounded conductor to serve as a controller. A 2-pole controller is permitted for such a circuit, where both conductors (grounded and ungrounded) are opened simultaneously. The same requirement can be applied to other circuits, such as 240-volt, 3-wire circuits with one conductor grounded.

### 430.87 Number of Motors Served by Each Controller

Each motor shall be provided with an individual controller.

*Exception No. 1: For motors rated 600 volts or less, a single controller rated at not less than the equivalent horsepower, as determined in accordance with 430.110(C)(1), of all the motors in the group shall be permitted to serve the group under any of the following conditions:*

- (a) *Where a number of motors drive several parts of a single machine or piece of apparatus, such as metal and woodworking machines, cranes, hoists, and similar apparatus*
- (b) *Where a group of motors is under the protection of one overcurrent device as permitted in 430.53(A)*
- (c) *Where a group of motors is located in a single room within sight from the controller location*

*Exception No. 2: A branch-circuit disconnecting means serving as the controller as allowed in 430.81(A) shall be permitted to serve more than one motor.*

The conditions stated in Exception No. 1 to 430.87 are similar to those specified in the exception to 430.112, which permit the use of a single disconnecting means for a group of motors.

### 430.88 Adjustable-Speed Motors

Adjustable-speed motors that are controlled by means of field regulation shall be equipped and connected so that they cannot be started under a weakened field.

*Exception: Starting under a weakened field shall be permitted where the motor is designed for such starting.*

The torque and speed of a dc motor depend on the amount of current passing through the armature. This current is a function of shunt field strength and rpm of the armature. A reduction of the shunt field magnetic flux causes a reduction of the counterelectromotive force in the armature, resulting in an increase in armature current, thereby increasing torque and thus increasing speed.

Because of excessive armature starting currents, field-regulated, adjustable-speed motors are not permitted to be started under a weakened field condition unless some means is provided to limit the speed to within safe limits.

### 430.89 Speed Limitation

Machines of the following types shall be provided with speed-limiting devices or other speed-limiting means:

- (1) Separately excited dc motors
- (2) Series motors
- (3) Motor-generators and converters that can be driven at excessive speed from the dc end, as by a reversal of current or decrease in load

*Exception: Separate speed-limiting devices or means shall not be required under either of the following conditions:*

- (1) *Where the inherent characteristics of the machines, the system, or the load and the mechanical connection thereto are such as to safely limit the speed*
- (2) *Where the machine is always under the manual control of a qualified operator*

Use of dc motors is still fairly common where speed control is essential, such as in the case of electric railways and elevators, where a smooth start, controlled acceleration, and a smooth stop are necessary. If the load is removed from a series motor when it is running, the speed of the motor will increase until it is dangerously high. To produce the necessary counterelectromotive force with a weakened field, the

armature must turn correspondingly faster. Series motors are commonly used as gear-drive traction motors of electric locomotives and, thus, are continuously loaded.

Except under the conditions noted in the exception, 430.89 requires separately excited dc motors, series motors, and motor (compound-wound dc) generators and (synchronous) converters to be provided with speed-limiting devices, such as a centrifugal device on the shaft of the machine or a remotely located overspeed device, which may be set at a predetermined speed to operate a set of contacts and thereby trip a circuit breaker and de-energize the machine.

### 430.90 Combination Fuseholder and Switch as Controller

The rating of a combination fuseholder and switch used as a motor controller shall be such that the fuseholder will accommodate the size of the fuse specified in Part III of this article for motor overload protection.

*Exception: Where fuses having time delay appropriate for the starting characteristics of the motor are used, fuseholders of smaller size than specified in Part III of this article shall be permitted.*

Time-delay (dual-element) fuses can be used for both motor overload and branch-circuit short-circuit and ground-fault protection and can be sized in accordance with 430.32. See also 430.36, 430.55, and 430.57 for other requirements regarding fuses and fuseholders.

## VIII. Motor Control Centers

### 430.92 General

Part VIII covers motor control centers installed for the control of motors, lighting, and power circuits.

Part VIII of Article 430 provides requirements for the installation of motor control centers. These requirements cover subjects that include overcurrent protection use as service equipment, grounding, and construction. Motor control centers are made up of a number of motor starters, controls, and disconnect switches assembled in one large enclosure. Motor control centers are allowed to be used as service equipment if provided with a single main disconnecting means. A second service disconnecting means, however, is permitted in the motor control center if it is provided to serve other loads.

In addition to Part VIII, installation requirements, including access and working space clearances, for motor control centers are contained in 110.26. The requirements

of 110.26(F) specify dedicated space for a motor control center and physical protection from mechanical systems that might leak or otherwise adversely affect a motor control center.

#### 430.94 Overcurrent Protection

Motor control centers shall be provided with overcurrent protection in accordance with Parts I, II, and VIII of Article 240. The ampere rating or setting of the overcurrent protective device shall not exceed the rating of the common power bus. This protection shall be provided by (1) an overcurrent protective device located ahead of the motor control center or (2) a main overcurrent protective device located within the motor control center.

Overcurrent protection cannot exceed the rating of the common power bus of a motor control center. Use of an overcurrent protective device with a rating less than the common power bus is permitted, provided it is of sufficient size to carry the load determined in accordance with Part II of Article 430.

#### 430.95 Service Equipment

Where used as service equipment, each motor control center shall be provided with a single main disconnecting means to disconnect all ungrounded service conductors.

*Exception: A second service disconnect shall be permitted to supply additional equipment.*

Where a grounded conductor is provided, the motor control center shall be provided with a main bonding jumper, sized in accordance with 250.28(D), within one of the sections for connecting the grounded conductor, on its supply side, to the motor control center equipment ground bus.

*Exception: High-impedance grounded neutral systems shall be permitted to be connected as provided in 250.36.*

#### 430.96 Grounding

Multisection motor control centers shall be connected together with an equipment grounding conductor or an equivalent equipment grounding bus sized in accordance with Table 250.122. Equipment grounding conductors shall be connected to this equipment grounding bus or to a grounding termination point provided in a single-section motor control center.

#### 430.97 Busbars and Conductors

**(A) Support and Arrangement.** Busbars shall be protected from physical damage and be held firmly in place.

Other than for required interconnections and control wiring, only those conductors that are intended for termination in a vertical section shall be located in that section.

*Exception: Conductors shall be permitted to travel horizontally through vertical sections where such conductors are isolated from the busbars by a barrier.*

**(B) Phase Arrangement.** The phase arrangement on 3-phase horizontal common power and vertical buses shall be A, B, C from front to back, top to bottom, or left to right, as viewed from the front of the motor control center. The B phase shall be that phase having the higher voltage to ground on 3-phase, 4-wire, delta-connected systems. Other busbar arrangements shall be permitted for additions to existing installations and shall be marked.

*Exception: Rear-mounted units connected to a vertical bus that is common to front-mounted units shall be permitted to have a C, B, A phase arrangement where properly identified.*

**(C) Minimum Wire-Bending Space.** The minimum wire-bending space at the motor control center terminals and minimum gutter space shall be as required in Article 312.

**(D) Spacings.** Spacings between motor control center bus terminals and other bare metal parts shall not be less than specified in Table 430.97.

**(E) Barriers.** Barriers shall be placed in all service-entrance motor control centers to isolate service busbars and terminals from the remainder of the motor control center.

#### 430.98 Marking

**(A) Motor Control Centers.** Motor control centers shall be marked according to 110.21, and such marking shall be plainly visible after installation. Marking shall also include common power bus current rating and motor control center short-circuit rating.

**(B) Motor Control Units.** Motor control units in a motor control center shall comply with 430.8.

### IX. Disconnecting Means

#### 430.101 General

Part IX is intended to require disconnecting means capable of disconnecting motors and controllers from the circuit.

Informational Note No. 1: See Figure 430.1.

Informational Note No. 2: See 110.22 for identification of disconnecting means.

**TABLE 430.97** Minimum Spacing Between Bare Metal Parts

Nominal Voltage	Opposite Polarity Where Mounted on the Same Surface		Opposite Polarity Where Held Free in Air		Live Parts to Ground	
	mm	in.	mm	in.	mm	in.
Not over 125 volts, nominal	19.1	$\frac{3}{4}$	12.7	$\frac{1}{2}$	12.7	$\frac{1}{2}$
Not over 250 volts, nominal	31.8	$1\frac{1}{4}$	19.1	$\frac{3}{4}$	12.7	$\frac{1}{2}$
Not over 600 volts, nominal	50.8	2	25.4	1	25.4	1

**430.102 Location**

**(A) Controller.** An individual disconnecting means shall be provided for each controller and shall disconnect the controller. The disconnecting means shall be located in sight from the controller location.

The installation shown in Exhibit 430.16 is an example of compliance with the requirements of 430.102(A).

**EXHIBIT 430.16** The disconnecting means for each controller, which must be within sight of the controller location per 430.102(A). (Courtesy of International Association of Electrical Inspectors)

*Exception No. 1:* For motor circuits over 600 volts, nominal, a controller disconnecting means capable of being locked in the open position shall be permitted to be out of sight of the controller, provided the controller is marked with a warning label giving the location of the disconnecting means.

*Exception No. 2:* A single disconnecting means shall be permitted for a group of coordinated controllers that drive

*several parts of a single machine or piece of apparatus. The disconnecting means shall be located in sight from the controllers, and both the disconnecting means and the controllers shall be located in sight from the machine or apparatus.*

*Exception No. 3:* The disconnecting means shall not be required to be in sight from valve actuator motor (VAM) assemblies containing the controller where such a location introduces additional or increased hazards to persons or property and conditions (a) and (b) are met.

- (a) The valve actuator motor assembly is marked with a warning label giving the location of the disconnecting means.
- (b) The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.

**(B) Motor.** A disconnecting means shall be provided for a motor in accordance with (B)(1) or (B)(2).

**(1) Separate Motor Disconnect.** A disconnecting means for the motor shall be located in sight from the motor location and the driven machinery location.

**(2) Controller Disconnect.** The controller disconnecting means required in accordance with 430.102(A) shall be permitted to serve as the disconnecting means for the motor if it is in sight from the motor location and the driven machinery location.

*Exception to (1) and (2):* The disconnecting means for the motor shall not be required under either condition (a) or condition (b), provided the controller disconnecting means required in accordance with 430.102(A) is individually capable of being locked in the open position. The provision for locking or adding a lock to the controller disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.

- (a) Where such a location of the disconnecting means for the motor is impracticable or introduces additional or increased hazards to persons or property
- (b) In industrial installations, with written safety procedures, where conditions of maintenance and supervision ensure that only qualified persons service the equipment

Informational Note No. 1: Some examples of increased or additional hazards include, but are not limited to, motors rated in excess of 100 hp, multimotor equipment, submersible motors, motors associated with adjustable speed drives, and motors located in hazardous (classified) locations.

Informational Note No. 2: For information on lockout/tagout procedures, see NFPA 70E-2009, *Standard for Electrical Safety in the Workplace*.

The main rules of 430.102(A) and (B) require that the disconnecting means be in sight of the controller, the motor location, and the driven-machinery location. For motors over 600 volts, the controller disconnecting means may be out of sight of the controller, provided the controller has a warning label indicating the location and identification of the disconnecting means, which must be capable of being locked in the open position.

A single disconnecting means may be located adjacent to a group of coordinated controllers, as illustrated in Exhibit 430.17, where the controllers are mounted on a multimotor continuous process machine.

Per the exception to 430.102(B), the disconnecting means may only be out of sight of the motor, as illustrated in

**EXHIBIT 430.17** A single disconnecting means located adjacent to a group of coordinated controllers mounted on a multimotor continuous process machine.

Exhibit 430.18, if the disconnecting means complying with 430.102(A) is individually capable of being locked in the open position and meets the criterion of either (a) or (b) of the exception. If locating the disconnecting means close to the motor location and driven machinery is impracticable due to the type of machinery, the type of facility, lack of space for locating large equipment such as disconnecting means rated over 600 volts, or any increased hazard to persons or property, the disconnecting means is permitted to be located remotely.

Industrial facilities that comply with OSHA, 29 CFR 1910.147, *The Control of Hazardous Energy (Lockout/Tagout)*, are permitted to have the disconnecting means located remotely. Section 430.102 clearly requires that individual disconnect switches or circuit breakers must be capable of being locked in the open position. Disconnect switches or circuit breakers that are located only behind the locked door of a panelboard or within locked rooms do not comply with the requirements of 430.102. The provision for locking or attaching a lock to the disconnecting means must be part of the disconnect and a permanent component of the switch or circuit breaker.

Informational Note No. 2 points out an important consideration and reference standard for employee safety in the workplace. *NFPA 70E-2009, Standard for Electrical Safety in the Workplace*, 120.2(A), requires in part that “all electrical circuit conductors and circuit parts shall not be considered to be in an electrically safe work condition until all of the applicable requirements of Article 120 have been met.” The work process specified in Article 120 includes removing the sources of energy, locking and tagging out the disconnecting means, and verifying the absence of voltage through the use of an approved voltage tester. Further, it states,

**EXHIBIT 430.18** A controller disconnecting means that is out of sight of the motor — only for cases that meet the requirements of (a) or (b) of 430.102(B), Exception.

“Lockout/tagout requirements shall apply to fixed, permanently installed equipment, to temporarily installed equipment, and to portable equipment.” The principles and procedures in *NFPA 70E* establish strict work rules requiring locking off (out) and tagging out of disconnect switches.

### 430.103 Operation

The disconnecting means shall open all ungrounded supply conductors and shall be designed so that no pole can be operated independently. The disconnecting means shall be permitted in the same enclosure with the controller. The disconnecting means shall be designed so that it cannot be closed automatically.

Informational Note: See 430.113 for equipment receiving energy from more than one source.

The *Code* requires that a switch, circuit breaker, or other device serve as a disconnecting means for both the controller and the motor, thereby providing safety during maintenance and inspection shutdown periods. The disconnecting means also disconnects the controller; therefore, it cannot be a part of the controller.

However, separate disconnects and controllers may be mounted on the same panel or contained in the same enclosure, such as combination fused-switch, magnetic-starter units.

Depending on the size of the motor and other conditions, the type of disconnecting means required may be a motor circuit switch, a circuit breaker, a general-use switch, an isolating switch, an attachment plug and receptacle, or a branch-circuit short-circuit and ground-fault protective device, as specified in 430.109.

If a motor stalls or is under heavy overload and the motor controller fails to properly open the circuit, the disconnecting means, which must be rated to interrupt locked-rotor current, can be used to open the circuit. For motors larger than 100 hp ac or 40 hp dc, the disconnecting means is, in accordance with 430.109(E), permitted to be a general-use or an isolating switch where plainly marked “Do not operate under load.”

### 430.104 To Be Indicating

The disconnecting means shall plainly indicate whether it is in the open (off) or closed (on) position.

### 430.105 Grounded Conductors

One pole of the disconnecting means shall be permitted to disconnect a permanently grounded conductor, provided the disconnecting means is designed so that the pole in the grounded conductor cannot be opened without simultaneously disconnecting all conductors of the circuit.

### 430.107 Readily Accessible

At least one of the disconnecting means shall be readily accessible.

### 430.108 Every Disconnecting Means

Every disconnecting means in the motor circuit between the point of attachment to the feeder or branch circuit and the point of connection to the motor shall comply with the requirements of 430.109 and 430.110.

Exhibit 430.19 represents an example of a listed disconnect switch rated in horsepower meeting the requirements of 430.109 and 430.110.

**EXHIBIT 430.19** Heavy-duty safety switches, UL-listed for use on systems up to 200,000 amperes fault current rms symmetrical with Class J or Class R fuses installed. (Courtesy of Schneider Electric)

### 430.109 Type

The disconnecting means shall be a type specified in 430.109(A), unless otherwise permitted in 430.109(B) through (G), under the conditions specified.

#### (A) General.

(1) **Motor Circuit Switch.** A listed motor-circuit switch rated in horsepower.

(2) **Molded Case Circuit Breaker.** A listed molded case circuit breaker.

(3) **Molded Case Switch.** A listed molded case switch.

**(4) Instantaneous Trip Circuit Breaker.** An instantaneous trip circuit breaker that is part of a listed combination motor controller.

**(5) Self-Protected Combination Controller.** Listed self-protected combination controller.

**(6) Manual Motor Controller.** Listed manual motor controllers additionally marked “Suitable as Motor Disconnect” shall be permitted as a disconnecting means where installed between the final motor branch-circuit short-circuit protective device and the motor. Listed manual motor controllers additionally marked “Suitable as Motor Disconnect” shall be permitted as disconnecting means on the line side of the fuses permitted in 430.52(C)(5). In this case, the fuses permitted in 430.52(C)(5) shall be considered supplementary fuses, and suitable branch-circuit short-circuit and ground-fault protective devices shall be installed on the line side of the manual motor controller additionally marked “Suitable as Motor Disconnect.”

**(7) System Isolation Equipment.** System isolation equipment shall be listed for disconnection purposes. System isolation equipment shall be installed on the load side of the overcurrent protection and its disconnecting means. The disconnecting means shall be one of the types permitted by 430.109(A)(1) through (A)(3).

The impetus for development of system isolation equipment (SIE) comes from today’s large and often complex machines where repeated operation of disconnecting means for maintenance or servicing is inherent to the process and the risk of injury to personnel is increased due to moving parts and multiple points of entry. Safety procedures for personnel servicing this equipment include detailed lockout/tagout protocols for all sources of mechanical and electrical energy.

System isolation equipment helps simplify electrical lockout/tagout procedures and can also be used as a means to isolate other energy sources such as pneumatic energy. In accordance with its definition in 430.2, *system isolation equipment* is “a redundantly monitored, remotely operated contactor-isolating system, packaged to provide the disconnection/isolation function.” This type of equipment is covered in NFPA 79, *Electrical Standard for Industrial Machinery*, as a means to disconnect and isolate separately operable parts of a large industrial machine. With its inclusion in 430.109 as a permitted type of disconnecting means, the *Code* recognizes the use of this disconnection/isolation system in applications that do not fall within the scope of the industrial machinery standard.

Unlike other disconnecting means recognized by 430.109(A) where the operation of the disconnecting means directly opens the supply circuit at that specific location,

system isolation equipment employs a lockable control circuit switch(es) (lockout switch) and a verification indication at the disconnecting means location (lockout station). Also, operation of the lockout switch causes power components such as a monitored magnetic contactor to open and isolate the electrical equipment associated with the machine from its power supply circuit. The system isolation equipment is classified according to its intended application with parameters that include the load characteristics, the method used to monitor the controlled load-side power circuit, the number and maximum distance to the farthest lockout station, and the available control interface functions.

In a typical configuration, the contactor is located in the system power and control panel and may control power to the entire machine or to portions of a large machine. The control equipment may be provided in several configuration options for distributing to lockout stations in single or multiplexed radial schemes according to the application.

Once an electrically safe condition is achieved (including discharge of any residual energy), verification of such condition is provided at the remote lockout station through the use of an indicator light. In equipment that uses lockable guarding, the same verification signal could also be used as part of the guard access system.

In contrast to a simple start/stop station and control circuit operating a magnetic contactor, the control panel for this system provides a sophisticated level of monitoring upon actuation of the remote lockout switch. If any portion of the safety system cannot be verified for proper operation, the safe condition indicator light will not illuminate at the remote lockout station. As part of the standard operating procedure, the failure to receive the safe condition signal has to be considered by personnel as an indication of an unsafe condition.

Among the critical safety elements that are provided by the control panel for the isolation system is the diversity and redundancy that is integrated into the safe condition verification logic. Another element is reducing the possibility of externally induced failure modes through the electrical isolation of the internal safety-related control circuits and the physical isolation of the equipment’s internal components. The control panel modules are sealed as are the circuits between the SIE component enclosures, to discourage tampering that could compromise the safe operation of the equipment and endanger personnel. Where the system includes multiple lockout stations, the controlled equipment cannot be re-energized until all of the lockout switches are returned to the “on” position. Nominal configurations of the SIE include provisions to prevent power from unexpectedly reaching the machine upon the restoration of power from the utility source. To re-energize the machine, all lockout switches must be in the closed or “on” position while at least one lockout switch must have been in the “off” or open

position or placed in the “off” or open position (and then moved to the “on” or closed position after the utility power had been restored).

The system isolation equipment is required to be listed for disconnection purposes and must be installed on the load side of the disconnecting means (could be a motor circuit switch, a molded case circuit breaker, or a molded case switch) and overcurrent protection for the supply circuit to the equipment.

**(B) Stationary Motors of 1/8 Horsepower or Less.** For stationary motors of 1/8 hp or less, the branch-circuit overcurrent device shall be permitted to serve as the disconnecting means.

**(C) Stationary Motors of 2 Horsepower or Less.** For stationary motors rated at 2 hp or less and 300 volts or less, the disconnecting means shall be permitted to be one of the devices specified in (1), (2), or (3):

- (1) A general-use switch having an ampere rating not less than twice the full-load current rating of the motor
- (2) On ac circuits, a general-use snap switch suitable only for use on ac (not general-use ac–dc snap switches) where the motor full-load current rating is not more than 80 percent of the ampere rating of the switch
- (3) A listed manual motor controller having a horsepower rating not less than the rating of the motor and marked “Suitable as Motor Disconnect”

**(D) Autotransformer-Type Controlled Motors.** For motors of over 2 hp to and including 100 hp, the separate disconnecting means required for a motor with an autotransformer-type controller shall be permitted to be a general-use switch where all of the following provisions are met:

- (1) The motor drives a generator that is provided with overload protection.
- (2) The controller is capable of interrupting the locked-rotor current of the motors, is provided with a no voltage release, and is provided with running overload protection not exceeding 125 percent of the motor full-load current rating.
- (3) Separate fuses or an inverse time circuit breaker rated or set at not more than 150 percent of the motor full-load current is provided in the motor branch circuit.

**(E) Isolating Switches.** For stationary motors rated at more than 40 hp dc or 100 hp ac, the disconnecting means shall be permitted to be a general-use or isolating switch where plainly marked “Do not operate under load.”

**(F) Cord-and-Plug-Connected Motors.** For a cord-and-plug-connected motor, a horsepower-rated attachment plug and receptacle, flanged surface inlet and cord connector, or

attachment plug and cord connector having ratings no less than the motor ratings shall be permitted to serve as the disconnecting means. Horsepower-rated attachment plugs, flanged surface inlets, receptacles, or cord connectors shall not be required for cord-and-plug-connected appliances in accordance with 422.33, room air conditioners in accordance with 440.63, or portable motors rated 1/3 hp or less.

Section 430.109 requires the disconnecting means to be a motor circuit switch, a circuit breaker, or a molded case switch (nonautomatic circuit interrupter). A motor circuit switch is a horsepower-rated switch capable of interrupting the maximum overload current of a motor (see the definition of *switch, motor-circuit* in Article 100). A molded case switch (nonautomatic circuit interrupter) is a circuit-breaker-like device without the overcurrent element and automatic-trip mechanism. It is rated in amperes and is suitable for use as a motor circuit disconnect based on its ampere rating, as is a circuit breaker. The disconnecting means must be listed.

Exhibits 430.20, 430.21, 430.22, and 430.23 illustrate various methods of providing motor disconnecting means as permitted by 430.109(B), 430.109(C), 430.109(E), and 430.109(F), respectively.

Where horsepower-rated fused switches are required, marking within the enclosure usually permits a dual horsepower rating. The standard horsepower rating is based on the largest non-time-delay (non-dual-element) fuse rating that can be used in the switch and that will permit the motor to start. The maximum horsepower rating is based on the largest rated time-delay (dual-element) fuse that can be used in the switch and that will permit the motor to start. Thus, where time-delay fuses are used, smaller-size switches and fuseholders can be used (see 430.57, Exception).

**EXHIBIT 430.20** A branch-circuit overcurrent device serving as the disconnecting means for a stationary motor of 1/8 hp or less according to 430.109(B).

**EXHIBIT 430.21** A general-use snap switch having an ampere rating not less than twice the motor full-load current serving as the disconnecting means for a stationary motor rated at 2 hp or less and at 300 volts or less according to 430.109(C).

**EXHIBIT 430.22** A general-use or an isolating switch serving as the disconnecting means for a stationary motor rated at more than 40 hp dc or 100 hp ac according to 430.109(E).

**EXHIBIT 430.23** An attachment plug and receptacle of the proper rating serving as the disconnecting means for a certain cord-and-plug-connected motor according to 430.109(F).

**(G) Torque Motors.** For torque motors, the disconnecting means shall be permitted to be a general-use switch.

### 430.110 Ampere Rating and Interrupting Capacity

**(A) General.** The disconnecting means for motor circuits rated 600 volts, nominal, or less shall have an ampere rating not less than 115 percent of the full-load current rating of the motor.

*Exception:* A listed unfused motor-circuit switch having a horsepower rating not less than the motor horsepower shall be permitted to have an ampere rating less than 115 percent of the full-load current rating of the motor.

**(B) For Torque Motors.** Disconnecting means for a torque motor shall have an ampere rating of at least 115 percent of the motor nameplate current.

**(C) For Combination Loads.** Where two or more motors are used together or where one or more motors are used in combination with other loads, such as resistance heaters, and where the combined load may be simultaneous on a single disconnecting means, the ampere and horsepower ratings of the combined load shall be determined as follows.

**(1) Horsepower Rating.** The rating of the disconnecting means shall be determined from the sum of all currents, including resistance loads, at the full-load condition and also at the locked-rotor condition. The combined full-load current and the combined locked-rotor current so obtained shall be considered as a single motor for the purpose of this requirement as follows.

The full-load current equivalent to the horsepower rating of each motor shall be selected from Table 430.247, Table 430.248, Table 430.249, or Table 430.250. These full-load currents shall be added to the rating in amperes of other loads to obtain an equivalent full-load current for the combined load.

The locked-rotor current equivalent to the horsepower rating of each motor shall be selected from Table 430.251(A) or Table 430.251(B). The locked-rotor currents shall be added to the rating in amperes of other loads to obtain an equivalent locked-rotor current for the combined load. Where two or more motors or other loads cannot be started simultaneously, the largest sum of locked-rotor currents of a motor or group of motors that can be started simultaneously and the full-load currents of other concurrent loads shall be permitted to be used to determine the equivalent locked-rotor current for the simultaneous combined loads. In cases where different current ratings are obtained when applying these tables, the largest value obtained shall be used.

*Exception:* Where part of the concurrent load is resistance load, and where the disconnecting means is a switch rated

in horsepower and amperes, the switch used shall be permitted to have a horsepower rating that is not less than the combined load of the motor(s), if the ampere rating of the switch is not less than the locked-rotor current of the motor(s) plus the resistance load.

**(2) Ampere Rating.** The ampere rating of the disconnecting means shall not be less than 115 percent of the sum of all currents at the full-load condition determined in accordance with 430.110(C)(1).

*Exception:* A listed nonfused motor-circuit switch having a horsepower rating equal to or greater than the equivalent horsepower of the combined loads, determined in accordance with 430.110(C)(1), shall be permitted to have an ampere rating less than 115 percent of the sum of all currents at the full-load condition.

**(3) Small Motors.** For small motors not covered by Table 430.247, Table 430.248, Table 430.249, or Table 430.250, the locked-rotor current shall be assumed to be six times the full-load current.

Per 430.110(C)(3), a general-use switch, circuit breaker, molded case switch (nonautomatic circuit interrupter), or attachment plug and receptacle used as a disconnecting means must have an ampere rating of not less than 115 percent of the motor full-load current.

Listed circuit breakers and molded case switches are tested under overload conditions at six times their rating, to cover motor circuit applications, and are suitable for use as a motor disconnecting means.

**Calculation Example**

The load consists of one 5-hp, one 3-hp, and two ½-hp motors, plus a 10-kW, all rated 240 volts, 3-phase. All motors are Design B motors. Determine the size of the disconnect required for this combination load.

**Solution**

Use the appropriate tables to calculate the full-load and locked-rotor current equivalents as follows:

**Calculation of Equivalent Full-Load Current Rating**

Motor or Other Load	Table	Amperes
5-hp motor	430.250	15.2
3-hp motor	430.250	9.6
½-hp motor	430.250	2.2
½-hp motor	430.250	2.2
10-kW heater		24.1
$\left[ \frac{10 \times 1000}{(240 \times 1.732)} = 24.1 \text{ amps} \right]$		
		Total 53.3

**STEP 1.** The disconnecting means for a motor must have an ampere rating that is not less than 115 percent and also have a horsepower rating that is not less than the combined load. Therefore, the minimum ampere rating of the disconnecting means is 61.3 amperes ( $1.15 \times 53.3 \text{ amperes} = 61.3 \text{ amperes}$ ).

**STEP 2.** Use Table 430.251(B) to obtain an equivalent horsepower from a locked-rotor current rating, the closest value equal to or greater than 220.1 amperes under the 230-volt column is 232 amperes, which equates to 15 hp.

**Calculation of Equivalent Locked-Rotor Current Rating**

Motor or Other Load	Table	Amperes
5-hp motor	430.251(B)	92
3-hp motor	430.251(B)	64
½-hp motor	430.251(B)	20
½-hp motor	430.251(B)	20
10-kW heater		24.1
$\left[ \frac{10 \times 1000}{(240 \times 1.732)} = 24.1 \text{ amps} \right]$		
		Total 220.1

A 15-hp general-purpose or heavy-duty switch satisfies the minimum horsepower requirement but fails to satisfy the minimum current requirement of 61.3 amperes. Therefore, the next larger size disconnect switch must be used, which in horsepower rating is 20 hp, because the locked-rotor current for a 20-hp, 3-phase, 230-volt motor is 290 amperes (over the needed 220.1 amperes) and the full-load current is 54 amperes (over the full-load rating of 53.3 amperes).

**430.111 Switch or Circuit Breaker as Both Controller and Disconnecting Means**

A switch or circuit breaker shall be permitted to be used as both the controller and disconnecting means if it complies with 430.111(A) and is one of the types specified in 430.111(B).

**(A) General.** The switch or circuit breaker complies with the requirements for controllers specified in 430.83, opens all ungrounded conductors to the motor, and is protected by an overcurrent device in each ungrounded conductor (which shall be permitted to be the branch-circuit fuses). The overcurrent device protecting the controller shall be permitted to be part of the controller assembly or shall be permitted to be separate. An autotransformer-type controller shall be provided with a separate disconnecting means.

**(B) Type.** The device shall be one of the types specified in 430.111(B)(1), (B)(2), or (B)(3).

**(1) Air-Break Switch.** An air-break switch, operable directly by applying the hand to a lever or handle.

**(2) Inverse Time Circuit Breaker.** An inverse time circuit breaker operable directly by applying the hand to a lever or handle. The circuit breaker shall be permitted to be both power and manually operable.

**(3) Oil Switch.** An oil switch used on a circuit whose rating does not exceed 600 volts or 100 amperes, or by special permission on a circuit exceeding this capacity where under expert supervision. The oil switch shall be permitted to be both power and manually operable.

If used as a controller, a switch or circuit breaker must meet all the requirements for controllers and be protected by branch-circuit short-circuit and ground-fault protective devices (fuses or a circuit breaker), which ensure that all ungrounded conductors will be opened.

If the controller consists of a manually operable air-break switch, an inverse time circuit breaker, or a 100-ampere maximum oil switch (higher rating by special permission), the controller is considered a satisfactory disconnecting means. It is the intent of 430.111 to permit omission of an additional device to serve as a disconnecting means.

A separate disconnecting means must be provided if the controller is of the autotransformer or compensator type. (This switch may be combined in the same enclosure with a motor overload protective device.)

### 430.112 Motors Served by Single Disconnecting Means

Each motor shall be provided with an individual disconnecting means.

*Exception: A single disconnecting means shall be permitted to serve a group of motors under any one of the conditions of (a), (b), and (c). The single disconnecting means shall be rated in accordance with 430.110(C).*

- (a) Where a number of motors drive several parts of a single machine or piece of apparatus, such as metal- and woodworking machines, cranes, and hoists.
- (b) Where a group of motors is under the protection of one set of branch-circuit protective devices as permitted by 430.53(A).
- (c) Where a group of motors is in a single room within sight from the location of the disconnecting means.

The exception to 430.112 permits a single disconnecting means to serve a group of motors. The disconnecting means

must have a rating equal to the sum of the horsepower or current of each motor in the group. If the sum is over 2 hp, a motor circuit switch (horsepower-rated) must be used; thus, for five 2-hp motors, the disconnecting means should be a motor circuit switch rated at not less than 10 hp.

Part (a) of the exception to 430.112 indicates that a single disconnecting means may be used where a number of motors drive several parts of a single machine, such as cranes (see 610.31 through 610.33), metal or woodworking machines, steel rolling mill machinery, and so on. The single disconnecting means for multimotor machinery provides a positive means of simultaneously de-energizing all motor branch circuits, including remote-control circuits, interlocking circuits, limit-switch circuits, and operator control stations.

Part (b) of the exception to 430.112 refers to 430.53(A), which permits a group of motors under the protection of the same branch-circuit device, provided the device is rated not more than 20 amperes at 125 volts, or 15 amperes at more than 125 volts, but not more than 600 volts. The motors must be rated 1 hp or less, and the full-load current for each motor is not permitted to exceed 6 amperes. A single disconnecting means is both practical and economical for a group of such small motors.

Part (c) of the exception to 430.112 covers the common situation in which a group of motors is located in one room, such as a pump room, compressor room, mixer room, and so on. It is therefore possible to design the layout of a single disconnecting means with an unobstructed view (not more than 50 ft) from each motor.

These conditions for an individual disconnecting means are similar to those specified in 430.87, which permits the use of a single controller for a group of motors.

### 430.113 Energy from More Than One Source

Motor and motor-operated equipment receiving electric energy from more than one source shall be provided with disconnecting means from each source of electric energy immediately adjacent to the equipment served. Each source shall be permitted to have a separate disconnecting means. Where multiple disconnecting means are provided, a permanent warning sign shall be provided on or adjacent to each disconnecting means.

*Exception No. 1: Where a motor receives electric energy from more than one source, the disconnecting means for the main power supply to the motor shall not be required to be immediately adjacent to the motor, provided the controller disconnecting means is capable of being locked in the open position.*

*Exception No. 2: A separate disconnecting means shall not be required for a Class 2 remote-control circuit conforming*

with Article 725, rated not more than 30 volts, and isolated and ungrounded.

Some motors may require multiple separate sources of power to operate properly. Power for a motor space heater is one example. Power for a speed switch is another. Synchronous motors commonly use dc power for excitation purposes. Section 430.113 could also apply to circuits that supply power to speed or vibration sensors mounted within or otherwise attached to the motor.

Where there are multiple disconnecting means for the individual sources, a permanent warning sign is required to warn the user that other power sources are present. Exception No. 2 to 430.113 relieves the user from the disconnect requirement only for Class 2 circuits.

## X. Adjustable-Speed Drive Systems

### 430.120 General.

The installation provisions of Part I through Part IX are applicable unless modified or supplemented by Part X.

Adjustable-speed drives are used extensively in commercial, institutional, and industrial motor applications. Exhibit 430.24 shows 480-volt adjustable-speed drives, also known as variable-frequency drives or VFDs.

**EXHIBIT 430.24** Adjustable-speed drives for air-handling units. These drives provide significant power savings for fan applications. (Courtesy of International Association of Electrical Inspectors)

Part X consolidates requirements that are unique to these drives. However, Parts I through IX must be followed unless modified or supplemented in Part X. The text provides rules

regarding methods of overtemperature protection in motors. This is a critical area, because motors operating at reduced speed do not provide adequate air circulation over windings from a fan integral with the motor. An overload device that actuates on current in excess of full-load amperes will not operate, because the operating current at slower speeds is reduced. A thermal-sensing device integral with the motor will sense a temperature rise in the motor windings.

Informational Note: Electrical resonance can result from the interaction of the nonsinusoidal currents from this type of load with power factor correction capacitors.

### 430.122 Conductors — Minimum Size and Ampacity

**(A) Branch/Feeder Circuit Conductors.** Circuit conductors supplying power conversion equipment included as part of an adjustable-speed drive system shall have an ampacity not less than 125 percent of the rated input current to the power conversion equipment.

Informational Note: Power conversion equipment can have multiple power ratings and corresponding input currents.

This informational note was added in the 2011 *Code*. Power conversion equipment might have only one rating on the nameplate. However, additional ratings can be provided in the manufacturer's instructions for use.

**(B) Bypass Device.** For an adjustable-speed drive system that utilizes a bypass device, the conductor ampacity shall not be less than required by 430.6. The ampacity of circuit conductors supplying power conversion equipment included as part of an adjustable-speed drive system that utilizes a bypass device shall be the larger of either of the following:

- (1) 125 percent of the rated input current to the power conversion equipment
- (2) 125 percent of the motor full-load current rating as determined by 430.6

### 430.124 Overload Protection

Overload protection of the motor shall be provided.

**(A) Included in Power Conversion Equipment.** Where the power conversion equipment is marked to indicate that motor overload protection is included, additional overload protection shall not be required.

**(B) Bypass Circuits.** For adjustable speed drive systems that utilize a bypass device to allow motor operation at rated full-load speed, motor overload protection as described in Article 430, Part III, shall be provided in the bypass circuit.

**(C) Multiple Motor Applications.** For multiple motor application, individual motor overload protection shall be provided in accordance with Article 430, Part III.

### 430.126 Motor Overtemperature Protection

**(A) General.** Adjustable speed drive systems shall protect against motor overtemperature conditions where the motor is not rated to operate at the nameplate rated current over the speed range required by the application. This protection shall be provided in addition to the conductor protection required in 430.32. Protection shall be provided by one of the following means.

Motor overtemperature protection for adjustable-speed drives is dependent on the application of the motor and may not be required for all applications. A motor thermally designed specifically to operate at low speeds may not require the same protection as a similarly sized standard motor. A drive with thermal memory had been required by 430.126(A)(2). There is an exception for motors in continuous duty.

- (1) Motor thermal protector in accordance with 430.32
- (2) Adjustable speed drive system with load and speed-sensitive overload protection and thermal memory retention upon shutdown or power loss

*Exception to (2): Thermal memory retention upon shutdown or power loss is not required for continuous duty loads.*

- (3) Overtemperature protection relay utilizing thermal sensors embedded in the motor and meeting the requirements of 430.32(A)(2) or (B)(2)
- (4) Thermal sensor embedded in the motor whose communications are received and acted upon by an adjustable speed drive system

**Informational Note:** The relationship between motor current and motor temperature changes when the motor is operated by an adjustable speed drive. In certain applications, overheating of motors can occur when operated at reduced speed, even at current levels less than a motor's rated full-load current. The overheating can be the result of reduced motor cooling when its shaft-mounted fan is operating less than rated nameplate RPM. As part of the analysis to determine whether overheating will occur, it is necessary to consider the continuous torque capability curves for the motor given the application requirements. This will assist in determining whether the motor overload protection will be able, on its own, to provide protection against overheating. These overheating protection requirements are only intended to apply to applications where an adjustable speed drive, as defined in 430.2, is used.

For motors that utilize external forced air or liquid cooling systems, overtemperature can occur if the cooling system is not operating. Although this issue is not unique to adjustable

speed applications, externally cooled motors are most often encountered with such applications. In these instances, overtemperature protection using direct temperature sensing is recommended [i.e., 430.126(A)(1), (A)(3), or (A)(4)], or additional means should be provided to ensure that the cooling system is operating (flow or pressure sensing, interlocking of adjustable speed drive system and cooling system, etc.).

**(B) Multiple Motor Applications.** For multiple motor applications, individual motor overtemperature protection shall be provided as required in 430.126(A).

**(C) Automatic Restarting and Orderly Shutdown.** The provisions of 430.43 and 430.44 shall apply to the motor overtemperature protection means.

### 430.128 Disconnecting Means

The disconnecting means shall be permitted to be in the incoming line to the conversion equipment and shall have a rating not less than 115 percent of the rated input current of the conversion unit.

## XI. Over 600 Volts, Nominal

### 430.221 General

Part XI recognizes the additional hazard due to the use of higher voltages. It adds to or amends the other provisions of this article.

### 430.222 Marking on Controllers

In addition to the marking required by 430.8, a controller shall be marked with the control voltage.

### 430.223 Raceway Connection to Motors

Flexible metal conduit or liquidtight flexible metal conduit not exceeding 1.8 m (6 ft) in length shall be permitted to be employed for raceway connection to a motor terminal enclosure.

### 430.224 Size of Conductors

Conductors supplying motors shall have an ampacity not less than the current at which the motor overload protective device(s) is selected to trip.

### 430.225 Motor-Circuit Overcurrent Protection

**(A) General.** Each motor circuit shall include coordinated protection to automatically interrupt overload and fault currents in the motor, the motor-circuit conductors, and the motor control apparatus.

*Exception: Where a motor is critical to an operation and the motor should operate to failure if necessary to prevent a greater hazard to persons, the sensing device(s) shall be*

*permitted to be connected to a supervised annunciator or alarm instead of interrupting the motor circuit.*

### (B) Overload Protection.

**(1) Type of Overload Device.** Each motor shall be protected against dangerous heating due to motor overloads and failure to start by a thermal protector integral with the motor or external current-sensing devices, or both. Protective device settings for each motor circuit shall be determined under engineering supervision.

This section was revised for the 2011 *Code*. A coordination study should be performed to correctly specify the protective relaying or thermal protectors based on the motor damage curves under qualified engineering supervision.

Selecting the proper overload and short-circuit protection for medium voltage motor circuits is more complex than for low voltage circuits. For medium voltage motor circuits, it becomes very critical for the overload relay to coordinate with the short-circuit protection because some short-circuit protective devices cannot safely open below certain multiples of their rating. In these overload cases, the overload relay must open before the short-circuit protective device is asked to open. At the same time, the overload relay may not safely open beyond certain multiples of its rating, requiring the short-circuit protective device to open. This all requires the curves of both the overload relay and the short-circuit protective device to be correlated to ensure that they are coordinated so that each opens only on levels of current for which it can safely open.

**(2) Wound-Rotor Alternating-Current Motors.** The secondary circuits of wound-rotor ac motors, including conductors, controllers, and resistors rated for the application, shall be considered as protected against overcurrent by the motor overload protection means.

**(3) Operation.** Operation of the overload interrupting device shall simultaneously disconnect all ungrounded conductors.

**(4) Automatic Reset.** Overload sensing devices shall not automatically reset after trip unless resetting of the overload sensing device does not cause automatic restarting of the motor or there is no hazard to persons created by automatic restarting of the motor and its connected machinery.

### (C) Fault-Current Protection.

**(1) Type of Protection.** Fault-current protection shall be provided in each motor circuit as specified by either (1)(a) or (1)(b).

(a) A circuit breaker of suitable type and rating arranged so that it can be serviced without hazard. The circuit breaker shall simultaneously disconnect all ungrounded conductors. The circuit breaker shall be permitted to sense the fault current by means of integral or external sensing elements.

(b) Fuses of a suitable type and rating placed in each ungrounded conductor. Fuses shall be used with suitable disconnecting means, or they shall be of a type that can also serve as the disconnecting means. They shall be arranged so that they cannot be serviced while they are energized.

**(2) Reclosing.** Fault-current interrupting devices shall not automatically reclose the circuit.

*Exception: Automatic reclosing of a circuit shall be permitted where the circuit is exposed to transient faults and where such automatic reclosing does not create a hazard to persons.*

**(3) Combination Protection.** Overload protection and fault-current protection shall be permitted to be provided by the same device.

## 430.226 Rating of Motor Control Apparatus

The ultimate trip current of overcurrent (overload) relays or other motor-protective devices used shall not exceed 115 percent of the controller's continuous current rating. Where the motor branch-circuit disconnecting means is separate from the controller, the disconnecting means current rating shall not be less than the ultimate trip setting of the overcurrent relays in the circuit.

## 430.227 Disconnecting Means

The controller disconnecting means shall be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.

# XII. Protection of Live Parts — All Voltages

## 430.231 General

Part XII specifies that live parts shall be protected in a manner judged adequate for the hazard involved.

## 430.232 Where Required

Exposed live parts of motors and controllers operating at 50 volts or more between terminals shall be guarded against accidental contact by enclosure or by location as follows:

(1) By installation in a room or enclosure that is accessible only to qualified persons

- (2) By installation on a suitable balcony, gallery, or platform, elevated and arranged so as to exclude unqualified persons
- (3) By elevation 2.5 m (8 ft) or more above the floor

*Exception: Live parts of motors operating at more than 50 volts between terminals shall not require additional guarding for stationary motors that have commutators, collectors, and brush rigging located inside of motor-end brackets and not conductively connected to supply circuits operating at more than 150 volts to ground.*

### 430.233 Guards for Attendants

Where live parts of motors or controllers operating at over 150 volts to ground are guarded against accidental contact only by location as specified in 430.232, and where adjustment or other attendance may be necessary during the operation of the apparatus, suitable insulating mats or platforms shall be provided so that the attendant cannot readily touch live parts unless standing on the mats or platforms.

Informational Note: For working space, see 110.26 and 110.34.

## XIII. Grounding — All Voltages

### 430.241 General

Part XIII specifies the grounding of exposed non-current-carrying metal parts, likely to become energized, of motor and controller frames to prevent a voltage aboveground in the event of accidental contact between energized parts and frames. Insulation, isolation, or guarding are suitable alternatives to grounding of motors under certain conditions.

### 430.242 Stationary Motors

The frames of stationary motors shall be grounded under any of the following conditions:

- (1) Where supplied by metal-enclosed wiring
- (2) Where in a wet location and not isolated or guarded
- (3) If in a hazardous (classified) location
- (4) If the motor operates with any terminal at over 150 volts to ground

Where the frame of the motor is not grounded, it shall be permanently and effectively insulated from the ground.

Any motor in a wet location that is subject to contact by personnel constitutes a serious hazard and, unless it is isolated, elevated, or guarded from reach, must be grounded.

Stationary motors are usually supplied by wiring that is enclosed in metal raceways, flexible metal conduit, or cables with metal sheaths. When effectively attached to the motor junction box or frame, the metal raceway or cable armor

serves as the equipment grounding conductor. See 250.118 for more information on types of equipment grounding conductors.

### 430.243 Portable Motors

The frames of portable motors that operate over 150 volts to ground shall be guarded or grounded.

Informational Note No. 1: See 250.114(4) for grounding of portable appliances in other than residential occupancies.

Informational Note No. 2: See 250.119(C) for color of equipment grounding conductor.

*Exception No. 1: Listed motor-operated tools, listed motor-operated appliances, and listed motor-operated equipment shall not be required to be grounded where protected by a system of double insulation or its equivalent. Double-insulated equipment shall be distinctively marked.*

*Exception No. 2: Listed motor-operated tools, listed motor-operated appliances, and listed motor-operated equipment connected by a cord and attachment plug other than those required to be grounded in accordance with 250.114.*

### 430.244 Controllers

Controller enclosures shall be connected to the equipment grounding conductor regardless of voltage. Controller enclosures shall have means for attachment of an equipment grounding conductor termination in accordance with 250.8.

*Exception: Enclosures attached to ungrounded portable equipment shall not be required to be grounded.*

### 430.245 Method of Grounding

Connection to the equipment grounding conductor shall be done in the manner specified in Part VI of Article 250.

Most motors are subject to vibration. Good wiring practice may require that the wiring to motors that are fixed be installed with a short section (not more than 6 ft) of liquidtight flexible metal or nonmetallic conduit or of flexible metal conduit to the motor terminal housing. Such use of flexible conduit requires an equipment grounding conductor.

**(A) Grounding Through Terminal Housings.** Where the wiring to motors is metal-enclosed cable or in metal raceways, junction boxes to house motor terminals shall be provided, and the armor of the cable or the metal raceways shall be connected to them in the manner specified in 250.96(A) and 250.97.

Informational Note: See 430.12(E) for equipment grounding connection means required at motor terminal housings.

**(B) Separation of Junction Box from Motor.** The junction box required by 430.245(A) shall be permitted to be separated from the motor by not more than 1.8 m (6 ft), provided the leads to the motor are stranded conductors within Type AC cable, interlocked metal tape Type MC cable where listed and identified in accordance with 250.118(10)(a), or armored cord or are stranded leads enclosed in liquidtight flexible metal conduit, flexible metal conduit, intermediate metal conduit, rigid metal conduit, or electrical metallic tubing not smaller than metric designator 12 (trade size  $\frac{3}{8}$ ), the armor or raceway being connected both to the motor and to the box.

Liquidtight flexible nonmetallic conduit and rigid non-metallic conduit shall be permitted to enclose the leads to the motor, provided the leads are stranded and the required equipment grounding conductor is connected to both the motor and to the box.

Where stranded leads are used, protected as specified above, each strand within the conductor shall be not larger than 10 AWG and shall comply with other requirements of this *Code* for conductors to be used in raceways.

**(C) Grounding of Controller-Mounted Devices.** Instrument transformer secondaries and exposed non-current-carrying metal or other conductive parts or cases of instrument transformers, meters, instruments, and relays shall be grounded as specified in 250.170 through 250.178.

## XIV. Tables

Tables 430.248 through 430.250 accurately reflect the typical and most used 4-pole and 2-pole induction motors in use.

**TABLE 430.247 Full-Load Current in Amperes, Direct-Current Motors**

The following values of full-load currents\* are for motors running at base speed.

Horsepower	Armature Voltage Rating*					
	90 Volts	120 Volts	180 Volts	240 Volts	500 Volts	550 Volts
$\frac{1}{4}$	4.0	3.1	2.0	1.6	—	—

#### I. General

##### 440.1 Scope

The provisions of this article apply to electric motor-driven air-conditioning and refrigerating equipment and to the branch circuits and controllers for such equipment. It provides for the special considerations necessary for circuits supplying hermetic refrigerant motor-compressors and for any air-conditioning or refrigerating equipment that is supplied from a branch circuit that supplies a hermetic refrigerant motor-compressor.

See the commentary following 440.3(D).

## 440.2 Definitions

**Branch-Circuit Selection Current.** The value in amperes to be used instead of the rated-load current in determining the ratings of motor branch-circuit conductors, disconnecting means, controllers, and branch-circuit short-circuit and ground-fault protective devices wherever the running overload protective device permits a sustained current greater than the specified percentage of the rated-load current. The value of branch-circuit selection current will always be equal to or greater than the marked rated-load current.

**Hermetic Refrigerant Motor-Compressor.** A combination consisting of a compressor and motor, both of which are enclosed in the same housing, with no external shaft or shaft seals, the motor operating in the refrigerant.

**Leakage-Current Detector-Interrupter (LCDI).** A device provided in a power supply cord or cord set that senses leakage current flowing between or from the cord conductors and interrupts the circuit at a predetermined level of leakage current.

As indicated by the definition, power-supply cords or cord sets with this type of protection automatically interrupt the circuit where leakage current between or from the conductors exceeds a predetermined level. Opening of the circuit is accomplished through the use of electronic switching or by “air-break” contacts. The circuit remains open until the cause of the leakage current is eliminated or the protection device is manually reset. Leakage current detection and interrupter protection is one of the protection methods for the power-supply cord or cord set of a room air conditioner specified in 440.65.

**Rated-Load Current.** The rated-load current for a hermetic refrigerant motor-compressor is the current resulting when the motor-compressor is operated at the rated load, rated voltage, and rated frequency of the equipment it serves.

## 440.3 Other Articles

**(A) Article 430.** These provisions are in addition to, or amendatory of, the provisions of Article 430 and other articles in this *Code*, which apply except as modified in this article.

**(B) Articles 422, 424, or 430.** The rules of Articles 422, 424, or 430, as applicable, shall apply to air-conditioning and refrigerating equipment that does not incorporate a hermetic refrigerant motor-compressor. This equipment includes devices that employ refrigeration compressors driven by conventional motors, furnaces with air-conditioning evaporator coils installed, fan-coil units, remote forced air-cooled condensers, remote commercial refrigerators, and so forth.

**(C) Article 422.** Equipment such as room air conditioners, household refrigerators and freezers, drinking water coolers, and beverage dispensers shall be considered appliances, and the provisions of Article 422 shall also apply.

**(D) Other Applicable Articles.** Hermetic refrigerant motor-compressors, circuits, controllers, and equipment shall also comply with the applicable provisions of Table 440.3(D).

Article 440 provides special considerations necessary for circuits supplying hermetic refrigerant motor-compressors and is in addition to or amendatory of the provisions of Article 430 and other applicable articles. However, many requirements — for example, for disconnecting means, controllers, single or group installations, and sizing of conductors — are the same as or similar to those applied in Article 430.

Article 440 does not apply unless a hermetic refrigerant motor-compressor is supplied. Article 440 must be applied in conjunction with Article 430.

Note the terms *rated-load current* and *branch-circuit selection current*, defined in 440.2. When a branch-circuit selection current is marked on a nameplate, it must be used instead of the rated-load current to determine the size of the disconnecting means, the controller, the motor branch-circuit conductors, and the overcurrent protective devices for the branch-circuit conductors and the motor. The value of branch-circuit selection current is always greater than the marked rated-load current.

**TABLE 440.3(D) Other Articles**

Equipment/Occupancy	Article	Section
Capacitors		460.9
Commercial garages, aircraft hangars, motor fuel dispensing facilities, bulk storage plants, spray application, dipping, and coating processes, and inhalation anesthetizing locations	511, 513, 514, 515, 516, and 517 Part IV

Resistors and reactors	470	

## 440.4 Marking on Hermetic Refrigerant Motor-Compressors and Equipment

**(A) Hermetic Refrigerant Motor-Compressor Nameplate.** A hermetic refrigerant motor-compressor shall be provided with a nameplate that shall indicate the manufacturer’s name, trademark, or symbol; identifying designation; phase; voltage; and frequency. The rated-load current in

amperes of the motor-compressor shall be marked by the equipment manufacturer on either or both the motor-compressor nameplate and the nameplate of the equipment in which the motor-compressor is used. The locked-rotor current of each single-phase motor-compressor having a rated-load current of more than 9 amperes at 115 volts, or more than 4.5 amperes at 230 volts, and each polyphase motor-compressor shall be marked on the motor-compressor nameplate. Where a thermal protector complying with 440.52(A)(2) and (B)(2) is used, the motor-compressor nameplate or the equipment nameplate shall be marked with the words “thermally protected.” Where a protective system complying with 440.52(A)(4) and (B)(4) is used and is furnished with the equipment, the equipment nameplate shall be marked with the words, “thermally protected system.” Where a protective system complying with 440.52(A)(4) and (B)(4) is specified, the equipment nameplate shall be appropriately marked.

#### **(B) Multimotor and Combination-Load Equipment.**

Multimotor and combination-load equipment shall be provided with a visible nameplate marked with the maker’s name, the rating in volts, frequency and number of phases, minimum supply circuit conductor ampacity, the maximum rating of the branch-circuit short-circuit and ground-fault protective device, and the short-circuit current rating of the motor controllers or industrial control panel. The ampacity shall be calculated by using Part IV and counting all the motors and other loads that will be operated at the same time. The branch-circuit short-circuit and ground-fault protective device rating shall not exceed the value calculated by using Part III. Multimotor or combination-load equipment for use on two or more circuits shall be marked with the above information for each circuit.

*Exception No. 1: Multimotor and combination-load equipment that is suitable under the provisions of this article for connection to a single 15- or 20-ampere, 120-volt, or a 15-ampere, 208- or 240-volt, single-phase branch circuit shall be permitted to be marked as a single load.*

*Exception No. 2: The minimum supply circuit conductor ampacity and the maximum rating of the branch-circuit short-circuit and ground-fault protective device shall not be required to be marked on a room air conditioner complying with 440.62(A).*

*Exception No. 3: Multimotor and combination-load equipment used in one- and two-family dwellings, cord-and-attachment-plug-connected equipment, or equipment supplied from a branch circuit protected at 60 A or less shall not be required to be marked with a short-circuit current rating.*

Motor controllers or control panels associated with multimotor and combination-load air-conditioning and refrigeration

equipment are required by 440.4(B) to be marked with the short-circuit current rating. Where air-conditioning equipment is installed at large commercial, institutional, and industrial complexes, the controllers and control panels of air-conditioning and refrigeration equipment are often supplied from a point on the electrical distribution system where significant short-circuit current is available.

As is the case with any electrical installation where high levels of short-circuit current are available, the short-circuit current rating marked on the air-conditioning equipment controllers and control panels provides those responsible for designing and approving the electrical installation with the necessary information to ensure compliance with the requirements of 110.10. Multimotor and combination-load air-conditioning equipment used in one- and two-family dwellings, cord-and-attachment-plug-connected air-conditioning equipment, and air-conditioning equipment supplied by branch circuits rated 60 amperes or less are not required to be marked with their short-circuit current rating. A similar requirement for marking the short-circuit current rating on equipment is specified by 430.8 for motor controllers.

**(C) Branch-Circuit Selection Current.** A hermetic refrigerant motor-compressor, or equipment containing such a compressor, having a protection system that is approved for use with the motor-compressor that it protects and that permits continuous current in excess of the specified percentage of nameplate rated-load current given in 440.52(B)(2) or (B)(4) shall also be marked with a branch-circuit selection current that complies with 440.52(B)(2) or (B)(4). This marking shall be provided by the equipment manufacturer and shall be on the nameplate(s) where the rated-load current(s) appears.

### **440.5 Marking on Controllers**

A controller shall be marked with the manufacturer’s name, trademark, or symbol; identifying designation; voltage; phase; full-load and locked-rotor current (or horsepower) rating; and such other data as may be needed to properly indicate the motor-compressor for which it is suitable.

### **440.6 Ampacity and Rating**

The size of conductors for equipment covered by this article shall be selected from Table 310.15(B)(16) through Table 310.15(B)(19) or calculated in accordance with 310.15 as applicable. The required ampacity of conductors and rating of equipment shall be determined according to 440.6(A) and 440.6(B).

**(A) Hermetic Refrigerant Motor-Compressor.** For a hermetic refrigerant motor-compressor, the rated-load current marked on the nameplate of the equipment in which the

motor-compressor is employed shall be used in determining the rating or ampacity of the disconnecting means, the branch-circuit conductors, the controller, the branch-circuit short-circuit and ground-fault protection, and the separate motor overload protection. Where no rated-load current is shown on the equipment nameplate, the rated-load current shown on the compressor nameplate shall be used.

*Exception No. 1: Where so marked, the branch-circuit selection current shall be used instead of the rated-load current to determine the rating or ampacity of the disconnecting means, the branch-circuit conductors, the controller, and the branch-circuit short-circuit and ground-fault protection.*

*Exception No. 2: For cord-and-plug-connected equipment, the nameplate marking shall be used in accordance with 440.22(B), Exception No. 2.*

Informational Note: For disconnecting means and controllers, see 440.12 and 440.41.

**(B) Multimotor Equipment.** For multimotor equipment employing a shaded-pole or permanent split-capacitor-type fan or blower motor, the full-load current for such motor marked on the nameplate of the equipment in which the fan or blower motor is employed shall be used instead of the horsepower rating to determine the ampacity or rating of the disconnecting means, the branch-circuit conductors, the controller, the branch-circuit short-circuit and ground-fault protection, and the separate overload protection. This marking on the equipment nameplate shall not be less than the current marked on the fan or blower motor nameplate.

### 440.7 Highest Rated (Largest) Motor

In determining compliance with this article and with 430.24, 430.53(B) and 430.53(C), and 430.62(A), the highest rated (largest) motor shall be considered to be the motor that has the highest rated-load current. Where two or more motors have the same highest rated-load current, only one of them shall be considered as the highest rated (largest) motor. For other than hermetic refrigerant motor-compressors, and fan or blower motors as covered in 440.6(B), the full-load current used to determine the highest rated motor shall be the equivalent value corresponding to the motor horsepower rating selected from Table 430.248, Table 430.249, or Table 430.250.

*Exception: Where so marked, the branch-circuit selection current shall be used instead of the rated-load current in determining the highest rated (largest) motor-compressor.*

### 440.8 Single Machine

An air-conditioning or refrigerating system shall be considered to be a single machine under the provisions of 430.87,

Exception, and 430.112, Exception. The motors shall be permitted to be located remotely from each other.

## II. Disconnecting Means

### 440.11 General

The provisions of Part II are intended to require disconnecting means capable of disconnecting air-conditioning and refrigerating equipment, including motor-compressors and controllers from the circuit conductors.

### 440.12 Rating and Interrupting Capacity

**(A) Hermetic Refrigerant Motor-Compressor.** A disconnecting means serving a hermetic refrigerant motor-compressor shall be selected on the basis of the nameplate rated-load current or branch-circuit selection current, whichever is greater, and locked-rotor current, respectively, of the motor-compressor as follows.

**(1) Ampere Rating.** The ampere rating shall be at least 115 percent of the nameplate rated-load current or branch-circuit selection current, whichever is greater.

*Exception: A listed unfused motor circuit switch, without fuseholders, having a horsepower rating not less than the equivalent horsepower determined in accordance with 440.12(A)(2) shall be permitted to have an ampere rating less than 115 percent of the specified current.*

**(2) Equivalent Horsepower.** To determine the equivalent horsepower in complying with the requirements of 430.109, the horsepower rating shall be selected from Table 430.248, Table 430.249, or Table 430.250 corresponding to the rated-load current or branch-circuit selection current, whichever is greater, and also the horsepower rating from Table 430.251(A) or Table 430.251(B) corresponding to the locked-rotor current. In case the nameplate rated-load current or branch-circuit selection current and locked-rotor current do not correspond to the currents shown in Table 430.248, Table 430.249, Table 430.250, Table 430.251(A), or Table 430.251(B), the horsepower rating corresponding to the next higher value shall be selected. In case different horsepower ratings are obtained when applying these tables, a horsepower rating at least equal to the larger of the values obtained shall be selected.

**(B) Combination Loads.** Where the combined load of two or more hermetic refrigerant motor-compressors or one or more hermetic refrigerant motor-compressor with other motors or loads may be simultaneous on a single disconnecting means, the rating for the disconnecting means shall be determined in accordance with 440.12(B)(1) and (B)(2).

**(1) Horsepower Rating.** The horsepower rating of the disconnecting means shall be determined from the sum of all currents, including resistance loads, at the rated-load condition and also at the locked-rotor condition. The combined rated-load current and the combined locked-rotor current so obtained shall be considered as a single motor for the purpose of this requirement as required by (1)(a) and (1)(b).

(a) The full-load current equivalent to the horsepower rating of each motor, other than a hermetic refrigerant motor-compressor, and fan or blower motors as covered in 440.6(B) shall be selected from Table 430.248, Table 430.249, or Table 430.250. These full-load currents shall be added to the motor-compressor rated-load current(s) or branch-circuit selection current(s), whichever is greater, and to the rating in amperes of other loads to obtain an equivalent full-load current for the combined load.

(b) The locked-rotor current equivalent to the horsepower rating of each motor, other than a hermetic refrigerant motor-compressor, shall be selected from Table 430.251(A) or Table 430.251(B), and, for fan and blower motors of the shaded-pole or permanent split-capacitor type marked with the locked-rotor current, the marked value shall be used. The locked-rotor currents shall be added to the motor-compressor locked-rotor current(s) and to the rating in amperes of other loads to obtain an equivalent locked-rotor current for the combined load. Where two or more motors or other loads such as resistance heaters, or both, cannot be started simultaneously, appropriate combinations of locked-rotor and rated-load current or branch-circuit selection current, whichever is greater, shall be an acceptable means of determining the equivalent locked-rotor current for the simultaneous combined load.

*Exception: Where part of the concurrent load is a resistance load and the disconnecting means is a switch rated in horsepower and amperes, the switch used shall be permitted to have a horsepower rating not less than the combined load to the motor-compressor(s) and other motor(s) at the locked-rotor condition, if the ampere rating of the switch is not less than this locked-rotor load plus the resistance load.*

**(2) Full-Load Current Equivalent.** The ampere rating of the disconnecting means shall be at least 115 percent of the sum of all currents at the rated-load condition determined in accordance with 440.12(B)(1).

*Exception: A listed unfused motor circuit switch, without fuseholders, having a horsepower rating not less than the equivalent horsepower determined by 440.12(B)(1) shall be permitted to have an ampere rating less than 115 percent of the sum of all currents.*

**(C) Small Motor-Compressors.** For small motor-compressors not having the locked-rotor current marked on the nameplate, or for small motors not covered by Table 430.247, Table 430.248, Table 430.249, or Table 430.250, the locked-rotor current shall be assumed to be six times the rated-load current.

**(D) Disconnecting Means.** Every disconnecting means in the refrigerant motor-compressor circuit between the point of attachment to the feeder and the point of connection to the refrigerant motor-compressor shall comply with the requirements of 440.12.

**(E) Disconnecting Means Rated in Excess of 100 Horsepower.** Where the rated-load or locked-rotor current as determined above would indicate a disconnecting means rated in excess of 100 hp, the provisions of 430.109(E) shall apply.

### 440.13 Cord-Connected Equipment

For cord-connected equipment such as room air conditioners, household refrigerators and freezers, drinking water coolers, and beverage dispensers, a separable connector or an attachment plug and receptacle shall be permitted to serve as the disconnecting means.

Informational Note: For room air conditioners, see 440.63.

### 440.14 Location

Disconnecting means shall be located within sight from and readily accessible from the air-conditioning or refrigerating equipment. The disconnecting means shall be permitted to be installed on or within the air-conditioning or refrigerating equipment.

The disconnecting means shall not be located on panels that are designed to allow access to the air-conditioning or refrigeration equipment or to obscure the equipment nameplate(s).

*Exception No. 1: Where the disconnecting means provided in accordance with 430.102(A) is capable of being locked in the open position, and the refrigerating or air-conditioning equipment is essential to an industrial process in a facility with written safety procedures, and where the conditions of maintenance and supervision ensure that only qualified persons service the equipment, a disconnecting means within sight from the equipment shall not be required. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker and shall remain in place with or without the lock installed.*

Exception No. 1 to 440.14 accommodates special conditions associated with process refrigeration equipment. Typically,

this equipment is very large, so rated disconnects may not be available. Additionally, this equipment may be in hazardous locations, and locating disconnecting means within sight of the motor may introduce additional hazards. The provision for locking or attaching a lock to the disconnecting means must be part of the disconnect and a permanent component of the switch or circuit breaker. The phrase “and shall remain in place with or without the lock installed” is used to preclude portable or transferable-type lockout devices from being used as the method to provide the ability to lock the switch or circuit breaker in the open (“off”) position. An example of this type of locking hardware is shown in Exhibit 440.1.

**EXHIBIT 440.1** An example of locking hardware that is not readily removable or transferable. (Courtesy of Schneider Electric)

*Exception No. 2: Where an attachment plug and receptacle serve as the disconnecting means in accordance with 440.13, their location shall be accessible but shall not be required to be readily accessible.*

Informational Note No. 1: See Parts VII and IX of Article 430 for additional requirements.

The references to Parts VII and IX of Article 430 in Informational Note No. 1 are intended to call attention to the additional disconnect location requirements in 430.102, 430.107, and 430.113. Because 440.3(A) makes the requirements in Article 440 in addition to or amendatory of the provisions of Article 430, the requirement of 440.14 mandates that the equipment disconnecting means be within sight from and readily accessible from the equipment, even if there is also a remote disconnect capable of being locked in the “open” position under the provision of the exception to 430.102(B).

This special requirement for air-conditioning and refrigeration equipment covered by Article 440 is more stringent than the provisions in Article 430, to provide protection for service personnel working on equipment located in attics, on roofs, or outside in a remote location where it is difficult to gain access to a remote lockable disconnect. See Exception No. 1 to 440.14.

Informational Note No. 2: See 110.26.

### III. Branch-Circuit Short-Circuit and Ground-Fault Protection

#### 440.21 General

The provisions of Part III specify devices intended to protect the branch-circuit conductors, control apparatus, and motors in circuits supplying hermetic refrigerant motor-compressors against overcurrent due to short circuits and ground faults. They are in addition to or amendatory of the provisions of Article 240.

Where an air conditioner is listed by a qualified electrical testing laboratory with a nameplate that reads “maximum fuse size,” the listing restricts the use of this unit to fuse protection only and does not cover its use with circuit breakers. If the air conditioner has been evaluated for both fuses and ordinary circuit breakers or both fuses and HACR-type circuit breakers, it is marked to indicate the acceptable type(s) of protective devices. UL-listed circuit breakers that have been found suitable for use with heating, air-conditioning, and refrigeration equipment comprising multimotor or combination loads are marked “Listed HACR Type.” Section 430.53(C) of the *Code* permits the use of any listed inverse time circuit breaker for the short-circuit, ground-fault protection of group motor installations. Section 110.3(B) requires that the installation and use instructions provided by the manufacturer of listed equipment be followed, and in the case of air-conditioning equipment it is important to carefully read the nameplate so that the correct type of short-circuit ground-fault protective device is selected.

The UL *Electrical Appliance and Utilization Equipment Directory* applies to this equipment. Exhibit 440.2 illustrates

**EXHIBIT 440.2** Three correct alternate wiring configurations satisfying a nameplate that specifies fuses, thus restricting the equipment to protection by fuses only. (Note that the fuse rating cannot exceed the maximum fuse size specified on the air-conditioner nameplate.)

three wiring configurations where the equipment is under fuse protection only.

Current-limiting overcurrent devices, which may reduce the amount of fault current to which the equipment is subjected, can be installed in the branch circuit supplying the equipment. See 240.2 for the definition of *current-limiting overcurrent protective device* and the accompanying commentary explaining short-circuit damage, which is particularly important for larger commercial and industrial installations. See also 110.3(B) and 110.10 and associated commentary regarding the installation and use of listed or labeled equipment and the selection of overcurrent protective devices (such as fuses and circuit breakers).

## 440.22 Application and Selection

### (A) Rating or Setting for Individual Motor-Compressor.

The motor-compressor branch-circuit short-circuit and ground-fault protective device shall be capable of carrying the starting current of the motor. A protective device having a rating or setting not exceeding 175 percent of the motor-compressor rated-load current or branch-circuit selection current, whichever is greater, shall be permitted, provided that, where the protection specified is not sufficient for the starting current of the motor, the rating or setting shall be permitted to be increased but shall not exceed 225 percent of the motor rated-load current or branch-circuit selection current, whichever is greater.

*Exception:* The rating of the branch-circuit short-circuit and ground-fault protective device shall not be required to be less than 15 amperes.

**(B) Rating or Setting for Equipment.** The equipment branch-circuit short-circuit and ground-fault protective de-

vice shall be capable of carrying the starting current of the equipment. Where the hermetic refrigerant motor-compressor is the only load on the circuit, the protection shall comply with 440.22(A). Where the equipment incorporates more than one hermetic refrigerant motor-compressor or a hermetic refrigerant motor-compressor and other motors or other loads, the equipment short-circuit and ground-fault protection shall comply with 430.53 and 440.22(B)(1) and (B)(2).

**(1) Motor-Compressor Largest Load.** Where a hermetic refrigerant motor-compressor is the largest load connected to the circuit, the rating or setting of the branch-circuit short-circuit and ground-fault protective device shall not exceed the value specified in 440.22(A) for the largest motor-compressor plus the sum of the rated-load current or branch-circuit selection current, whichever is greater, of the other motor-compressor(s) and the ratings of the other loads supplied.

**(2) Motor-Compressor Not Largest Load.** Where a hermetic refrigerant motor-compressor is not the largest load connected to the circuit, the rating or setting of the branch-circuit short-circuit and ground-fault protective device shall not exceed a value equal to the sum of the rated-load current or branch-circuit selection current, whichever is greater, rating(s) for the motor-compressor(s) plus the value specified in 430.53(C)(4) where other motor loads are supplied, or the value specified in 240.4 where only nonmotor loads are supplied in addition to the motor-compressor(s).

*Exception No. 1:* Equipment that starts and operates on a 15- or 20-ampere 120-volt, or 15-ampere 208- or 240-volt single-phase branch circuit, shall be permitted to be protected by the 15- or 20-ampere overcurrent device

protecting the branch circuit, but if the maximum branch-circuit short-circuit and ground-fault protective device rating marked on the equipment is less than these values, the circuit protective device shall not exceed the value marked on the equipment nameplate.

*Exception No. 2: The nameplate marking of cord-and-plug-connected equipment rated not greater than 250 volts, single-phase, such as household refrigerators and freezers, drinking water coolers, and beverage dispensers, shall be used in determining the branch-circuit requirements, and each unit shall be considered as a single motor unless the nameplate is marked otherwise.*

**(C) Protective Device Rating Not to Exceed the Manufacturer's Values.** Where maximum protective device ratings shown on a manufacturer's overload relay table for use with a motor controller are less than the rating or setting selected in accordance with 440.22(A) and (B), the protective device rating shall not exceed the manufacturer's values marked on the equipment.

## IV. Branch-Circuit Conductors

### 440.31 General

The provisions of Part IV and Article 310 specify ampacities of conductors required to carry the motor current without overheating under the conditions specified, except as modified in 440.6(A), Exception No. 1.

The provisions of these articles shall not apply to integral conductors of motors, to motor controllers and the like, or to conductors that form an integral part of approved equipment.

Informational Note: See 300.1(B) and 310.1 for similar requirements.

### 440.32 Single Motor-Compressor

Branch-circuit conductors supplying a single motor-compressor shall have an ampacity not less than 125 percent of either the motor-compressor rated-load current or the branch-circuit selection current, whichever is greater.

For a wye-start, delta-run connected motor-compressor, the selection of branch-circuit conductors between the controller and the motor-compressor shall be permitted to be based on 72 percent of either the motor-compressor rated-load current or the branch-circuit selection current, whichever is greater.

For more information on wye-start, delta-run motors, see the commentary following 430.22(C).

Informational Note: The individual motor circuit conductors of wye-start, delta-run connected motor-compressors

carry 58 percent of the rated load current. The multiplier of 72 percent is obtained by multiplying 58 percent by 1.25.

### 440.33 Motor-Compressor(s) With or Without Additional Motor Loads

Conductors supplying one or more motor-compressor(s) with or without an additional load(s) shall have an ampacity not less than the sum of the rated-load or branch-circuit selection current ratings, whichever is larger, of all the motor-compressors plus the full-load currents of the other motors, plus 25 percent of the highest motor or motor-compressor rating in the group.

*Exception No. 1: Where the circuitry is interlocked so as to prevent the starting and running of a second motor-compressor or group of motor-compressors, the conductor size shall be determined from the largest motor-compressor or group of motor-compressors that is to be operated at a given time.*

*Exception No. 2: The branch-circuit conductors for room air conditioners shall be in accordance with Part VII of Article 440.*

Branch circuits for listed air-conditioning and refrigeration equipment that have a nameplate marked with the branch-circuit conductor size and branch-circuit short-circuit protective device size are not required to have the branch-circuit conductors sized in accordance with 440.33. The testing laboratory standard includes the 25 percent increase for the largest motor or compressor in the group plus the other non-motor or noncompressor load; therefore, the actual nameplate full-load amperes for the complete assembly can be used to size the branch-circuit conductors.

### 440.34 Combination Load

Conductors supplying a motor-compressor load in addition to other load(s) as calculated from Article 220 and other applicable articles shall have an ampacity sufficient for the other load(s) plus the required ampacity for the motor-compressor load determined in accordance with 440.33 or, for a single motor-compressor, in accordance with 440.32.

*Exception: Where the circuitry is interlocked so as to prevent simultaneous operation of the motor-compressor(s) and all other loads connected, the conductor size shall be determined from the largest size required for the motor-compressor(s) and other loads to be operated at a given time.*

### 440.35 Multimotor and Combination-Load Equipment

The ampacity of the conductors supplying multimotor and combination-load equipment shall not be less than the

minimum circuit ampacity marked on the equipment in accordance with 440.4(B).

## V. Controllers for Motor-Compressors

### 440.41 Rating

**(A) Motor-Compressor Controller.** A motor-compressor controller shall have both a continuous-duty full-load current rating and a locked-rotor current rating not less than the nameplate rated-load current or branch-circuit selection current, whichever is greater, and locked-rotor current, respectively, of the compressor. In case the motor controller is rated in horsepower but is without one or both of the foregoing current ratings, equivalent currents shall be determined from the ratings as follows. Table 430.248, Table 430.249, and Table 430.250 shall be used to determine the equivalent full-load current rating. Table 430.251(A) and Table 430.251(B) shall be used to determine the equivalent locked-rotor current ratings.

**(B) Controller Serving More Than One Load.** A controller serving more than one motor-compressor or a motor-compressor and other loads shall have a continuous-duty full-load current rating and a locked-rotor current rating not less than the combined load as determined in accordance with 440.12(B).

## VI. Motor-Compressor and Branch-Circuit Overload Protection

### 440.51 General

The provisions of Part VI specify devices intended to protect the motor-compressor, the motor-control apparatus, and the branch-circuit conductors against excessive heating due to motor overload and failure to start.

Informational Note: See 240.4(G) for application of Parts III and VI of Article 440.

### 440.52 Application and Selection

**(A) Protection of Motor-Compressor.** Each motor-compressor shall be protected against overload and failure to start by one of the following means:

- (1) A separate overload relay that is responsive to motor-compressor current. This device shall be selected to trip at not more than 140 percent of the motor-compressor rated-load current.
- (2) A thermal protector integral with the motor-compressor, approved for use with the motor-compressor that it protects on the basis that it will prevent dangerous overheating of the motor-compressor due to overload and failure to start. If the current-interrupting device is separate from the motor-compressor and its control circuit is operated by a protective device integral with the motor-

compressor, it shall be arranged so that the opening of the control circuit will result in interruption of current to the motor-compressor.

- (3) A fuse or inverse time circuit breaker responsive to motor current, which shall also be permitted to serve as the branch-circuit short-circuit and ground-fault protective device. This device shall be rated at not more than 125 percent of the motor-compressor rated-load current. It shall have sufficient time delay to permit the motor-compressor to start and accelerate its load. The equipment or the motor-compressor shall be marked with this maximum branch-circuit fuse or inverse time circuit breaker rating.
- (4) A protective system, furnished or specified and approved for use with the motor-compressor that it protects on the basis that it will prevent dangerous overheating of the motor-compressor due to overload and failure to start. If the current-interrupting device is separate from the motor-compressor and its control circuit is operated by a protective device that is not integral with the current-interrupting device, it shall be arranged so that the opening of the control circuit will result in interruption of current to the motor-compressor.

**(B) Protection of Motor-Compressor Control Apparatus and Branch-Circuit Conductors.** The motor-compressor controller(s), the disconnecting means, and the branch-circuit conductors shall be protected against overcurrent due to motor overload and failure to start by one of the following means, which shall be permitted to be the same device or system protecting the motor-compressor in accordance with 440.52(A):

*Exception: Overload protection of motor-compressors and equipment on 15- and 20-ampere, single-phase, branch circuits shall be permitted to be in accordance with 440.54 and 440.55.*

- (1) An overload relay selected in accordance with 440.52(A)(1)
- (2) A thermal protector applied in accordance with 440.52(A)(2), that will not permit a continuous current in excess of 156 percent of the marked rated-load current or branch-circuit selection current
- (3) A fuse or inverse time circuit breaker selected in accordance with 440.52(A)(3)
- (4) A protective system, in accordance with 440.52(A)(4), that will not permit a continuous current in excess of 156 percent of the marked rated-load current or branch-circuit selection current

### 440.53 Overload Relays

Overload relays and other devices for motor overload protection that are not capable of opening short circuits shall be protected by fuses or inverse time circuit breakers with

ratings or settings in accordance with Part III unless identified for group installation or for part-winding motors and marked to indicate the maximum size of fuse or inverse time circuit breaker by which they shall be protected.

*Exception: The fuse or inverse time circuit breaker size marking shall be permitted on the nameplate of the equipment in which the overload relay or other overload device is used.*

#### **440.54 Motor-Compressors and Equipment on 15- or 20-Ampere Branch Circuits — Not Cord-and-Attachment-Plug-Connected**

Overload protection for motor-compressors and equipment used on 15- or 20-ampere 120-volt, or 15-ampere 208- or 240-volt single-phase branch circuits as permitted in Article 210 shall be permitted as indicated in 440.54(A) and 440.54(B).

**(A) Overload Protection.** The motor-compressor shall be provided with overload protection selected as specified in 440.52(A). Both the controller and motor overload protective device shall be identified for installation with the short-circuit and ground-fault protective device for the branch circuit to which the equipment is connected.

**(B) Time Delay.** The short-circuit and ground-fault protective device protecting the branch circuit shall have sufficient time delay to permit the motor-compressor and other motors to start and accelerate their loads.

#### **440.55 Cord-and-Attachment-Plug-Connected Motor-Compressors and Equipment on 15- or 20-Ampere Branch Circuits**

Overload protection for motor-compressors and equipment that are cord-and-attachment-plug-connected and used on 15- or 20-ampere 120-volt, or 15-ampere 208- or 240-volt, single-phase branch circuits as permitted in Article 210 shall be permitted as indicated in 440.55(A), (B), and (C).

**(A) Overload Protection.** The motor-compressor shall be provided with overload protection as specified in 440.52(A). Both the controller and the motor overload protective device shall be identified for installation with the short-circuit and ground-fault protective device for the branch circuit to which the equipment is connected.

**(B) Attachment Plug and Receptacle or Cord Connector Rating.** The rating of the attachment plug and receptacle or cord connector shall not exceed 20 amperes at 125 volts or 15 amperes at 250 volts.

**(C) Time Delay.** The short-circuit and ground-fault protective device protecting the branch circuit shall have sufficient

time delay to permit the motor-compressor and other motors to start and accelerate their loads.

### **VII. Provisions for Room Air Conditioners**

#### **440.60 General**

The provisions of Part VII shall apply to electrically energized room air conditioners that control temperature and humidity. For the purpose of Part VII, a room air conditioner (with or without provisions for heating) shall be considered as an ac appliance of the air-cooled window, console, or in-wall type that is installed in the conditioned room and that incorporates a hermetic refrigerant motor-compressor(s). The provisions of Part VII cover equipment rated not over 250 volts, single phase, and such equipment shall be permitted to be cord-and-attachment-plug-connected.

A room air conditioner that is rated 3-phase or rated over 250 volts shall be directly connected to a wiring method recognized in Chapter 3, and provisions of Part VII shall not apply.

#### **440.61 Grounding**

The enclosures of room air conditioners shall be connected to the equipment grounding conductor in accordance with 250.110, 250.112, and 250.114.

#### **440.62 Branch-Circuit Requirements**

**(A) Room Air Conditioner as a Single Motor Unit.** A room air conditioner shall be considered as a single motor unit in determining its branch-circuit requirements where all the following conditions are met:

- (1) It is cord-and-attachment-plug-connected.
- (2) Its rating is not more than 40 amperes and 250 volts, single phase.
- (3) Total rated-load current is shown on the room air-conditioner nameplate rather than individual motor currents.
- (4) The rating of the branch-circuit short-circuit and ground-fault protective device does not exceed the ampacity of the branch-circuit conductors or the rating of the receptacle, whichever is less.

**(B) Where No Other Loads Are Supplied.** The total marked rating of a cord-and-attachment-plug-connected room air conditioner shall not exceed 80 percent of the rating of a branch circuit where no other loads are supplied.

**(C) Where Lighting Units or Other Appliances Are Also Supplied.** The total marked rating of a cord-and-attachment-plug-connected room air conditioner shall not exceed 50 percent of the rating of a branch circuit where lighting outlets, other appliances, or general-use receptacles are also supplied. Where the circuitry is interlocked to prevent

simultaneous operation of the room air conditioner and energization of other outlets on the same branch circuit, a cord-and-attachment-plug-connected room air conditioner shall not exceed 80 percent of the branch-circuit rating.

### 440.63 Disconnecting Means

An attachment plug and receptacle or cord connector shall be permitted to serve as the disconnecting means for a single-phase room air conditioner rated 250 volts or less if (1) the manual controls on the room air conditioner are readily accessible and located within 1.8 m (6 ft) of the floor, or (2) an approved manually operable disconnecting means is installed in a readily accessible location within sight from the room air conditioner.

### 440.64 Supply Cords

Where a flexible cord is used to supply a room air conditioner, the length of such cord shall not exceed 3.0 m (10 ft) for a nominal, 120-volt rating or 1.8 m (6 ft) for a nominal, 208- or 240-volt rating.

### 440.65 Leakage-Current Detector-Interrupter (LCDI) and Arc-Fault Circuit Interrupter (AFCI)

Single-phase cord-and-plug-connected room air conditioners shall be provided with factory-installed LCDI or AFCI protection. The LCDI or AFCI protection shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm (12 in.) of the attachment plug.

To provide enhanced protection against fires initiated by damaged supply cords, all single-phase cord-and-plug-connected room air conditioners are required by 440.65 to be equipped with either leakage current detection and interruption protection or arc-fault circuit-interrupter protection. The protective device is required to be installed in the appliance cord and must be within 12 in. of the attachment plug.

## ARTICLE 445 Generators

- 445.16 Bushings
- 445.17 Generator Terminal Housings
- 445.18 Disconnecting Means Required for Generators
- 445.19 Generators Supplying Multiple Loads

### 445.1 Scope

This article contains installation and other requirements for generators.

Generators are generally associated with fire pumps (see Article 695), emergency systems (see Article 700), legally required standby systems (see Article 701), optional standby systems (see Article 702), interconnected electric power production sources (see Article 705), and critical operations power systems (see Article 708). Article 445 covers the installation of generators; the aforementioned articles cover the use of generators in particular situations and applications. Exhibit 445.1 shows an example of a diesel engine-driven generator.

**EXHIBIT 445.1** A diesel engine-driven generator that may be used in an emergency system, legally required standby system, optional standby system, or critical operations standby system.

### 445.10 Location

Generators shall be of a type suitable for the locations in which they are installed. They shall also meet the requirements for motors in 430.14.

### 445.11 Marking

Each generator shall be provided with a nameplate giving the manufacturer's name, the rated frequency, power factor, number of phases if of alternating current, the subtransient and transient impedances, the rating in kilowatts or kilovolt amperes, the normal volts and amperes corresponding to the rating, rated revolutions per minute, insulation system class and rated ambient temperature or rated temperature rise, and time rating.

### 445.12 Overcurrent Protection

**(A) Constant-Voltage Generators.** Constant-voltage generators, except ac generator exciters, shall be protected from overload by inherent design, circuit breakers, fuses, protective relays, or other identified overcurrent protective means suitable for the conditions of use.

**(B) Two-Wire Generators.** Two-wire, dc generators shall be permitted to have overcurrent protection in one conductor only if the overcurrent device is actuated by the entire current generated other than the current in the shunt field. The overcurrent device shall not open the shunt field.

**(C) 65 Volts or Less.** Generators operating at 65 volts or less and driven by individual motors shall be considered as protected by the overcurrent device protecting the motor if these devices will operate when the generators are delivering not more than 150 percent of their full-load rated current.

**(D) Balancer Sets.** Two-wire, dc generators used in conjunction with balancer sets to obtain neutral points for 3-wire systems shall be equipped with overcurrent devices that disconnect the 3-wire system in case of excessive unbalancing of voltages or currents.

**(E) Three-Wire, Direct-Current Generators.** Three-wire, dc generators, whether compound or shunt wound, shall be equipped with overcurrent devices, one in each armature lead, and connected so as to be actuated by the entire current from the armature. Such overcurrent devices shall consist either of a double-pole, double-coil circuit breaker or of a 4-pole circuit breaker connected in the main and equalizer leads and tripped by two overcurrent devices, one in each armature lead. Such protective devices shall be interlocked so that no one pole can be opened without simultaneously disconnecting both leads of the armature from the system.

*Exception to (A) through (E): Where deemed by the authority having jurisdiction that a generator is vital to the operation of an electrical system and the generator should operate to failure to prevent a greater hazard to persons, the overload sensing device(s) shall be permitted to be connected to an annunciator or alarm supervised by authorized personnel instead of interrupting the generator circuit.*

### 445.13 Ampacity of Conductors

The ampacity of the conductors from the generator terminals to the first distribution device(s) containing overcurrent protection shall not be less than 115 percent of the nameplate current rating of the generator. It shall be permitted to size the neutral conductors in accordance with 220.61. Conductors that must carry ground-fault currents shall not be smaller than required by 250.30(A). Neutral conductors of dc generators that must carry ground-fault currents shall not be smaller than the minimum required size of the largest conductor.

*Exception: Where the design and operation of the generator prevent overloading, the ampacity of the conductors shall not be less than 100 percent of the nameplate current rating of the generator.*

### 445.14 Protection of Live Parts

Live parts of generators operated at more than 50 volts to ground shall not be exposed to accidental contact where accessible to unqualified persons.

### 445.15 Guards for Attendants

Where necessary for the safety of attendants, the requirements of 430.233 shall apply.

### 445.16 Bushings

Where wires pass through an opening in an enclosure, a conduit box, or a barrier, a bushing shall be used to protect the conductors from the edges of an opening having sharp edges. The bushing shall have smooth, well-rounded surfaces where it may be in contact with the conductors. If used where oils, grease, or other contaminants may be present, the bushing shall be made of a material not deleteriously affected.

### 445.17 Generator Terminal Housings

Generator terminal housings shall comply with 430.12. Where a horsepower rating is required to determine the required minimum size of the generator terminal housing, the full-load current of the generator shall be compared with comparable motors in Table 430.247 through Table 430.250. The higher horsepower rating of Table 430.247 and Table 430.250 shall be used whenever the generator selection is between two ratings.

### 445.18 Disconnecting Means Required for Generators

Generators shall be equipped with disconnect(s), lockable in the open position, by means of which the generator and all protective devices and control apparatus are able to be disconnected entirely from the circuits supplied by the generator except where both of the following conditions apply:

- (1) The driving means for the generator can be readily shut down.
- (2) The generator is not arranged to operate in parallel with another generator or other source of voltage.

#### 445.19 Generators Supplying Multiple Loads

A single generator supplying more than one load, or multiple generators operating in parallel, shall be permitted to supply either of the following:

- (1) A vertical switchboard with separate sections
- (2) Individual enclosures with overcurrent protection tapped from a single feeder for load separation and distribution if a generator(s) is provided with overcurrent protection meeting the requirements of 240.15(A).

#### 450.1 Scope

This article covers the installation of all transformers.

*Exception No. 1: Current transformers.*

See 110.23 for the requirement on energized current transformers that are not in use.

*Exception No. 2: Dry-type transformers that constitute a component part of other apparatus and comply with the requirements for such apparatus.*

*Exception No. 3: Transformers that are an integral part of an X-ray, high-frequency, or electrostatic-coating apparatus.*

*Exception No. 4: Transformers used with Class 2 and Class 3 circuits that comply with Article 725.*

*Exception No. 5: Transformers for sign and outline lighting that comply with Article 600.*

*Exception No. 6: Transformers for electric-discharge lighting that comply with Article 410.*

*Exception No. 7: Transformers used for power-limited fire alarm circuits that comply with Part III of Article 760.*

*Exception No. 8: Transformers used for research, development, or testing, where effective arrangements are provided to safeguard persons from contacting energized parts.*

This article covers the installation of transformers dedicated to supplying power to a fire pump installation as modified by Article 695.

This article also covers the installation of transformers in hazardous (classified) locations as modified by Articles 501 through 504.

## I. General Provisions

### 450.2 Definition

For the purpose of this article, the following definition shall apply.

**Transformer.** An individual transformer, single- or poly-phase, identified by a single nameplate, unless otherwise indicated in this article.

### 450.3 Overcurrent Protection

Overcurrent protection of transformers shall comply with 450.3(A), (B), or (C). As used in this section, the word *transformer* shall mean a transformer or polyphase bank of two or more single-phase transformers operating as a unit.

Informational Note No. 1: See 240.4, 240.21, 240.100, and 240.101 for overcurrent protection of conductors.

The requirements for overcurrent protection of transformer secondaries in 450.3 apply only to the protection of transformers, not to the protection of conductors. The sections in Article 240 referenced in the informational note apply only to the protection of conductors, not to the protection of transformers. It is possible that the overcurrent protection required by Article 450 also satisfies the requirements in Article 240 for protection of the conductors, and vice versa, but it is also possible that they do not.

Informational Note No. 2: Nonlinear loads can increase heat in a transformer without operating its overcurrent protective device.

The increased heating effects of nonlinear load currents must be taken into account when determining the load on a transformer. Methods for handling these heating effects include derating equipment, oversizing equipment, increasing insulation ratings, installing thermal protection systems, and using K-factor transformers. The optimum method for dealing with transformer overheating varies, depending on several technical and economic factors, and is best determined during the design phase of the electrical system.

**(A) Transformers Over 600 Volts, Nominal.** Overcurrent protection shall be provided in accordance with Table 450.3(A).

Notes to a table are part of the requirements of the table, unlike the information contained in informational notes, which per 90.5(C) are explanatory in nature and not enforceable.

For Note 1 of Table 450.3(A), concerning standard ratings of circuit breakers and fuses, see 240.6.

For Note 2 of the table, overcurrent protection of the secondary of a transformer is allowed to consist of not more than six sets of fuses or six circuit breakers, under the following conditions:

1. They must be grouped in one location.
2. The sum of the overcurrent devices must not exceed the maximum value of a single device.
3. Where a combination of fuses and circuit breakers is used, the maximum value will be that of a single set of fuses.

Exhibits 450.1 and 450.2 illustrate the conditions given in Note 2, which also appears in Table 450.3(B) and applies to transformers rated 600 volts and less as well.

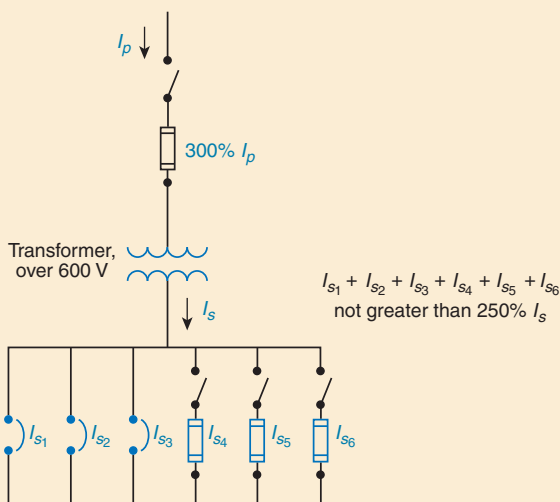

For Note 3 of Table 450.3(A), a supervised location is where maintenance of the equipment is performed by personnel who have received safety training and are familiar with proper operation of the equipment and aware of the hazards associated with it. See Article 100 for the definition of a *qualified person*.

For Note 4 of the table, an *electronically actuated fuse* responds to a signal from an electronic control rather than heat from a current. See the definition in Article 100, Part II, Over 600 Volts, Nominal.

The ratings or settings obtained from Table 450.3(A) are based on the type of protective device (fuse, electronic fuse, or circuit breaker), transformer-rated current and impedance, and primary and secondary voltages. According to

**EXHIBIT 450.1** A transformer rated over 600 volts with a secondary rated over 600 volts, with secondary protection consisting of six circuit breakers. The sum of the ratings of the circuit breakers is not permitted to exceed 300 percent of the rated secondary current, according to Table 450.3(A), Note 2.

**EXHIBIT 450.2** A transformer rated over 600 volts with a secondary rated over 600 volts, with secondary protection consisting of fuses and circuit breakers. The sum of the ratings of all the overcurrent devices is not permitted to exceed the rating permitted for fuses, according to Table 450.3(A), Note 2.

Table 450.3(A), the maximum ratings or settings of an overcurrent protective device for transformers rated over 600 volts are separated into two broad categories: *any location* (or unsupervised) and *supervised locations only*.

The first category for over 600-volt transformers is not limited by location and is referred to as *any location*. The maximum ratings or settings for overcurrent devices permitted in the *any location* row are applicable to all unsupervised locations. An *any location* transformer installation must be provided with overcurrent protection in both the primary and secondary circuit. The user may select the *any location* row even if the location qualifies for the *supervised locations only* category, because the requirements for the *any location* row are the same as or exceed the *supervised locations only* row. See Exhibit 450.3 for an example of an installation using circuit breakers on the primary and the secondary for an over 600-volt transformer with 6 percent impedance.

The second category for over 600-volt transformers is

**EXHIBIT 450.3** A transformer with 6 percent impedance and rated over 600 volts using circuit-breaker protection for both the primary and the secondary. For the transformer in this exhibit, both the primary and the secondary voltages are over 600 volts, according to Table 450.3(A).

*supervised locations only*. The maximum ratings or settings for overcurrent devices permitted in the *supervised locations only* rows are strictly limited to the conditions explained in Note 3 of Table 450.3(A). If the location of a transformer does not qualify as a supervised location, it is necessary to select the general rows of *any location* in Table 450.3(A). The installation shown in Exhibit 450.3, for example, fulfills the requirements of both *any location* and *supervised locations only*.

Part VIII, Supervised Industrial Installations, in Article 240, Overcurrent Protection, contains overcurrent protection requirements for feeders and feeder taps associated with transformers. Also, requirements for the overcurrent protection of transformer secondary conductors are found in 240.4(F).

**(B) Transformers 600 Volts, Nominal, or Less.** Overcurrent protection shall be provided in accordance with Table 450.3(B).

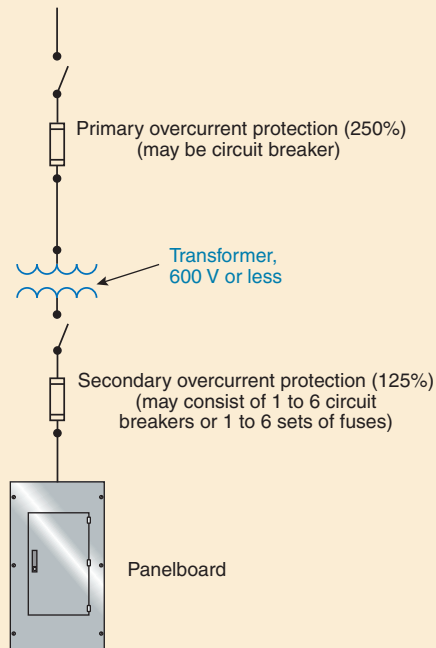

The ratings or settings of the overcurrent protective device obtained from Table 450.3(B) are based on the transformer-rated current and whether secondary protection is provided. According to Table 450.3(B), the maximum ratings or settings of overcurrent protective devices for transformers rated 600 volts and less are separated into two categories: *primary only protection* and *primary and secondary protection*.

According to Table 450.3(B), transformers with currents of 9 amperes or more must be protected by either of two methods. Method 1 requires primary protection only and is set at not more than 125 percent of the primary side current rating. Method 2 requires secondary side overcurrent protection to be set at not more than 125 percent, provided the primary side overcurrent protection is set at not more than 250 percent of the primary side current rating.

An example of *primary only protection* is shown in Exhibit 450.4. An example of *primary and secondary protection* is shown in Exhibit 450.5. For overcurrent protection of motor control circuit transformers, see 430.72(C).

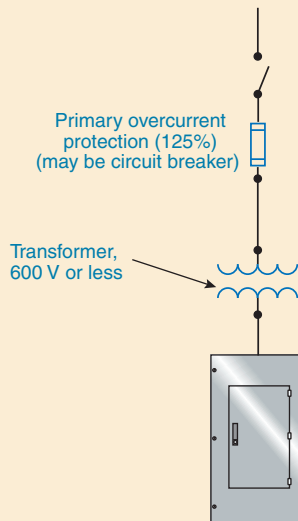

Questions frequently arise as to whether the overcurrent protection required for transformers, as specified in 450.3,

Primary and Secondary Overcurrent Protection

**EXHIBIT 450.5** A transformer (9 amperes or more) rated 600 volts or less and protected by a combination of primary and secondary overcurrent protection, according to Table 450.3(B).

Primary Overcurrent Protection Only

**EXHIBIT 450.4** A transformer (with currents of 9 amperes or more) rated 600 volts or less with only primary overcurrent protection, according to Table 450.3(B).

provides satisfactory protection for the primary and secondary conductors. Where polyphase transformers are involved, primary and secondary conductors are usually not properly protected. The rules in 450.3 are intended to protect the transformer alone. The primary overcurrent device provides short-circuit protection for the primary conductors and a degree of overload protection for the transformer, and secondary overcurrent devices prevent the transformer and secondary conductors from being overloaded. The transformer is considered the point of supply, and the conductors it supplies must be protected in accordance with their ampacity.

Section 240.4(F) permits the secondary circuit conductors from a transformer to be protected by overcurrent devices in the primary circuit conductors of the transformer only in two special cases. The first case is a transformer with a 2-wire primary and a 2-wire secondary, provided the transformer primary is protected in accordance with 450.3. The second case is a 3-phase, delta-delta-connected transformer having a 3-wire, single-voltage secondary, provided its primary is protected in accordance with 450.3. Where the primary feeder to the transformer incorporates overcurrent protective devices rated (or set) at a level not to exceed those prescribed herein, it is not necessary to duplicate them at the transformer.

**TABLE 450.3(A) Maximum Rating or Setting of Overcurrent Protection for Transformers Over 600 Volts (as a Percentage of Transformer-Rated Current)**

Location Limitations	Transformer Rated Impedance	Primary Protection over 600 Volts		Secondary Protection (See Note 2.)		
		Circuit Breaker (See Note 4.)	Fuse Rating	Over 600 Volts		600 Volts or Less
				Circuit Breaker (See Note 4.)	Fuse Rating	Circuit Breaker or Fuse Rating
Any location	Not more than 6%	600% (See Note 1.)	300% (See Note 1.)	300% (See Note 1.)	250% (See Note 1.)	125% (See Note 1.)
	More than 6% and not more than 10%	400% (See Note 1.)	300% (See Note 1.)	250% (See Note 1.)	225% (See Note 1.)	125% (See Note 1.)
Supervised locations only (See Note 3.)	Any	300% (See Note 1.)	250% (See Note 1.)	Not required	Not required	Not required
	Not more than 6%	600%	300%	300% (See Note 5.)	250% (See Note 5.)	250% (See Note 5.)
	More than 6% and not more than 10%	400%	300%	250% (See Note 5.)	225% (See Note 5.)	250% (See Note 5.)

## Notes:

- Where the required fuse rating or circuit breaker setting does not correspond to a standard rating or setting, a higher rating or setting that does not exceed the next higher standard rating or setting shall be permitted.
- Where secondary overcurrent protection is required, the secondary overcurrent device shall be permitted to consist of not more than six circuit breakers or six sets of fuses grouped in one location. Where multiple overcurrent devices are utilized, the total of all the device ratings shall not exceed the allowed value of a single overcurrent device. If both circuit breakers and fuses are used as the overcurrent device, the total of the device ratings shall not exceed that allowed for fuses.
- A supervised location is a location where conditions of maintenance and supervision ensure that only qualified persons monitor and service the transformer installation.
- Electronically actuated fuses that may be set to open at a specific current shall be set in accordance with settings for circuit breakers.
- A transformer equipped with a coordinated thermal overload protection by the manufacturer shall be permitted to have separate secondary protection omitted.

**TABLE 450.3(B) Maximum Rating or Setting of Overcurrent Protection for Transformers 600 Volts and Less (as a Percentage of Transformer-Rated Current)**

Protection Method	Primary Protection			Secondary Protection (See Note 2.)	
	Currents of 9 Amperes or More	Currents Less Than 9 Amperes	Currents Less Than 2 Amperes	Currents of 9 Amperes or More	Currents Less Than 9 Amperes
Primary only protection	125% (See Note 1.)	167%	300%	Not required	Not required
Primary and secondary protection	250% (See Note 3.)	250% (See Note 3.)	250% (See Note 3.)	125% (See Note 1.)	167%

## Notes:

- Where 125 percent of this current does not correspond to a standard rating of a fuse or nonadjustable circuit breaker, a higher rating that does not exceed the next higher standard rating shall be permitted.
- Where secondary overcurrent protection is required, the secondary overcurrent device shall be permitted to consist of not more than six circuit breakers or six sets of fuses grouped in one location. Where multiple overcurrent devices are utilized, the total of all the device ratings shall not exceed the allowed value of a single overcurrent device.
- A transformer equipped with coordinated thermal overload protection by the manufacturer and arranged to interrupt the primary current shall be permitted to have primary overcurrent protection rated or set at a current value that is not more than six times the rated current of the transformer for transformers having not more than 6 percent impedance and not more than four times the rated current of the transformer for transformers having more than 6 percent but not more than 10 percent impedance.

*Exception: Where the transformer is installed as a motor control circuit transformer in accordance with 430.72(C)(1) through (C)(6).*

**(C) Voltage Transformers.** Voltage transformers installed indoors or enclosed shall be protected with primary fuses.

Informational Note: For protection of instrument circuits including voltage transformers, see 408.52.

#### 450.4 Autotransformers 600 Volts, Nominal, or Less

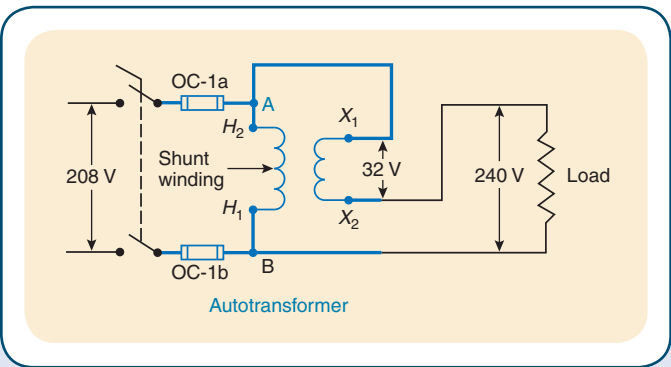

**(A) Overcurrent Protection.** Each autotransformer 600 volts, nominal, or less shall be protected by an individual overcurrent device installed in series with each ungrounded input conductor. Such overcurrent device shall be rated or set at not more than 125 percent of the rated full-load input current of the autotransformer. Where this calculation does not correspond to a standard rating of a fuse or nonadjustable circuit breaker and the rated input current is 9 amperes or more, the next higher standard rating described in 240.6 shall be permitted. An overcurrent device shall not be installed in series with the shunt winding (the winding common to both the input and the output circuits) of the autotransformer between Points A and B as shown in Figure 450.4.

**FIGURE 450.4** Autotransformer.

Because of the voltage feedback problem that may occur, an overcurrent device is not permitted between points A and B in Figure 450.4.

Exhibit 450.6 provides an example of overcurrent protection for an autotransformer. It shows a 2-winding, single-phase transformer connected to boost a 208-volt supply to 240 volts. The autotransformer is provided with a 2-pole disconnect switch with both overcurrent devices (OC-1a and OC-1b) located on the supply side of the autotransformer. If an overcurrent device were located between points A and B and this overcurrent device opened, the full 208-volt supply voltage would be applied across the 32-volt secondary winding in series with the load. Under those conditions, a higher-than-normal voltage would appear across the primary

**EXHIBIT 450.6** A disconnect switch with overcurrent devices properly connected to protect an autotransformer and located to meet the requirements of 450.4(A), last sentence.

winding. If the load impedance were very low, this voltage could approach  $208/32 \times 208 = 1352$  volts.

*Exception: Where the rated input current of the autotransformer is less than 9 amperes, an overcurrent device rated or set at not more than 167 percent of the input current shall be permitted.*

**(B) Transformer Field-Connected as an Autotransformer.** A transformer field-connected as an autotransformer shall be identified for use at elevated voltage.

The requirement in 450.4(B) is necessary because of the dielectric voltage withstand test requirements applied to transformers. The test is conducted at 2500 volts for windings rated 250 volts or less and at 4000 volts for higher-rated windings. A transformer intended for buck or boost operation would require that the test for the low-voltage winding be based on the sum of the primary and secondary voltage ratings.

Informational Note: For information on permitted uses of autotransformers, see 210.9 and 215.11.

#### 450.5 Grounding Autotransformers

Grounding autotransformers covered in this section are zig-zag or T-connected transformers connected to 3-phase, 3-wire ungrounded systems for the purpose of creating a 3-phase, 4-wire distribution system or providing a neutral point for grounding purposes. Such transformers shall have a continuous per-phase current rating and a continuous neutral current rating. Zig-zag connected transformers shall not be installed on the load side of any system grounding connection, including those made in accordance with 250.24(B), 250.30(A)(1), or 250.32(B) Exception.

Section 450.5 prohibits the installation of grounding autotransformers on the load side of a supply system grounding connection. This restriction applies to services, to separately derived systems, and to feeders and branch circuits that supply separate buildings or structures. Where a zigzag transformer is used to create a neutral reference point on a circuit that is supplied from a grounded system, the current from a line-to-ground fault is shared through the supply system transformer and the zigzag transformer.

Where the rating of the circuit in which the line-to-ground fault occurs exceeds the rating of the circuit in which the zigzag transformer is used, the shared ground-fault current through the zigzag transformer has the potential to cause serious damage to the transformer. For instance, a zigzag transformer is installed on an existing 50-ampere, 3-phase, 3-wire branch circuit to create a neutral. The branch circuit is derived from a grounded wye service, from which large capacity, 800-ampere and 1000-ampere feeders are also supplied. A line-to-ground fault in one of these feeder circuits can result in serious damage to the zigzag transformer as a result of its sharing the fault current with the system supply transformer.

**Informational Note:** The phase current in a grounding autotransformer is one-third the neutral current.

**(A) Three-Phase, 4-Wire System.** A grounding autotransformer used to create a 3-phase, 4-wire distribution system from a 3-phase, 3-wire ungrounded system shall conform to 450.5(A)(1) through (A)(4).

**(1) Connections.** The transformer shall be directly connected to the ungrounded phase conductors and shall not be switched or provided with overcurrent protection that is independent of the main switch and common-trip overcurrent protection for the 3-phase, 4-wire system.

**(2) Overcurrent Protection.** An overcurrent sensing device shall be provided that will cause the main switch or common-trip overcurrent protection referred to in 450.5(A)(1) to open if the load on the autotransformer reaches or exceeds 125 percent of its continuous current per-phase or neutral rating. Delayed tripping for temporary overcurrents sensed at the autotransformer overcurrent device shall be permitted for the purpose of allowing proper operation of branch or feeder protective devices on the 4-wire system.

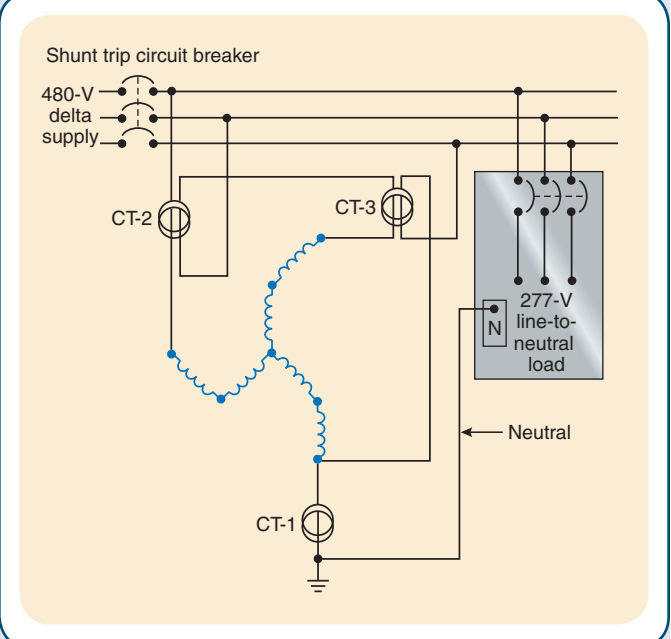

**(3) Transformer Fault Sensing.** A fault-sensing system that causes the opening of a main switch or common-trip overcurrent device for the 3-phase, 4-wire system shall be provided to guard against single-phasing or internal faults.

**Informational Note:** This can be accomplished by the use of two subtractive-connected donut-type current transformers

installed to sense and signal when an unbalance occurs in the line current to the autotransformer of 50 percent or more of rated current.

**(4) Rating.** The autotransformer shall have a continuous neutral-current rating that is sufficient to handle the maximum possible neutral unbalanced load current of the 4-wire system.

Exhibit 450.7 illustrates the proper method of protecting a grounding autotransformer used to provide a neutral for a 3-phase system where necessary to supply a group of single-phase, line-to-neutral loads. Separate overcurrent protection is not provided for the autotransformer, because there will be no control of the system line-to-neutral voltages if the autotransformer becomes disconnected. Consequently, simultaneous interruption of the power supply to all the line-to-neutral loads is necessary whenever the grounding autotransformer is switched off.

**EXHIBIT 450.7** A zigzag autotransformer used to establish a neutral connection for a 480Y/277-volt, 3-phase ungrounded system to supply single-phase line-to-neutral loads.

CT-1 is connected to an overload relay responsive to excess neutral current being supplied. See Section 450.5(A)(2). CT-2 and CT-3 are connected to differential-type fault-current sensing relays responsive to an unbalance of neutral current among the three phases of the grounding autotransformer (indicating an internal fault). All three relays are to be arranged to trip the circuit breaker located upstream of both the autotransformer and the line-to-neutral connected loads.

**(B) Ground Reference for Fault Protection Devices.** A grounding autotransformer used to make available a specified magnitude of ground-fault current for operation of a ground-responsive protective device on a 3-phase, 3-wire ungrounded system shall conform to 450.5(B)(1) and (B)(2).

**(1) Rating.** The autotransformer shall have a continuous neutral-current rating sufficient for the specified ground-fault current.

**(2) Overcurrent Protection.** Overcurrent protection shall comply with (a) and (b).

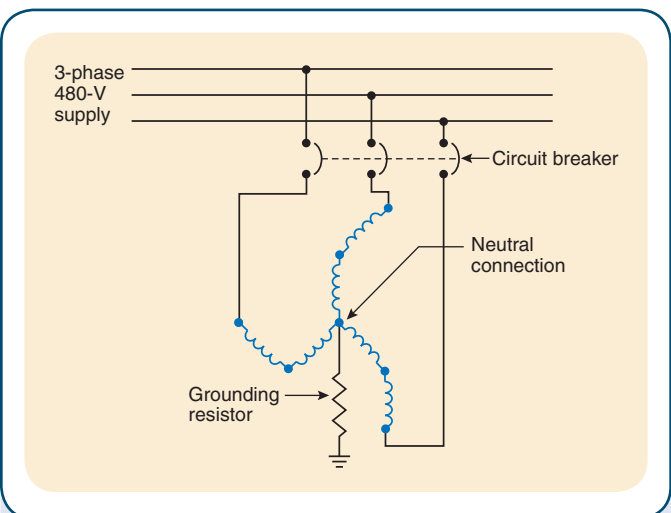

(a) *Operation and Interrupting Rating.* An overcurrent protective device having an interrupting rating in compliance with 110.9 and that will open simultaneously all ungrounded conductors when it operates shall be applied in the grounding autotransformer branch circuit.

(b) *Ampere Rating.* The overcurrent protection shall be rated or set at a current not exceeding 125 percent of the autotransformer continuous per-phase current rating or 42 percent of the continuous-current rating of any series-connected devices in the autotransformer neutral connection. Delayed tripping for temporary overcurrents to permit the proper operation of ground-responsive tripping devices on the main system shall be permitted but shall not exceed values that would be more than the short-time current rating of the grounding autotransformer or any series connected devices in the neutral connection thereto.

*Exception: For high-impedance grounded systems covered in 250.36, where the maximum ground-fault current is designed to be not more than 10 amperes, and where the grounding autotransformer and the grounding impedance are rated for continuous duty, an overcurrent device rated not more than 20 amperes that will simultaneously open all ungrounded conductors shall be permitted to be installed on the line side of the grounding autotransformer.*

In high-impedance grounded systems, the currents are low enough that finding overcurrent devices rated at 125 percent of a typical 5-ampere system was not practical.

Exhibit 450.8 illustrates the proper method of protecting a grounding autotransformer where it is used as a ground reference for fault protective devices. The overcurrent protective device is to have a rating (or setting) not in excess of 125 percent of the rated phase current of the autotransformer (42 percent of the neutral current rating) and not more than 42 percent of the continuous current rating of the neutral grounding resistor or other current-carrying device in the neutral connection, as specified in 450.5(B)(2).

**EXHIBIT 450.8** A zigzag autotransformer used to establish a reference ground-fault current for fault-protective-device operation or for damping transitory overvoltage surges.

**(C) Ground Reference for Damping Transitory Overvoltages.** A grounding autotransformer used to limit transitory overvoltages shall be of suitable rating and connected in accordance with 450.5(A)(1).

For installations involving a high-resistance grounding package, the functional performance of the installation parallels that described in 450.5(B), differing only in that the magnitude of available ground-fault current would likely be a lower value. It would be appropriate to employ the connections displayed in Exhibit 450.8 and to conform to the overcurrent protection requirements prescribed in 450.5(B)(2).

With any of the grounding autotransformer applications covered by 450.5(A), (B), or (C), the use of a ganged 3-pole switching interrupter for connecting and disconnecting the autotransformer accomplishes simultaneous connection (and disconnection) of the three line terminals. If, at any time, one or two of the line connections to the autotransformer were to open, which could occur if the protective devices were single pole, the grounding autotransformer would cease to function in the desired fashion and would act as a high-inductive-reactance connection between the electrical system and ground. The latter connection is prone to create high-value transitory overvoltages, line-to-ground.

## 450.6 Secondary Ties

As used in this article, a secondary tie is a circuit operating at 600 volts, nominal, or less between phases that connects two power sources or power supply points, such as the secondaries of two transformers. The tie shall be permitted to consist of one or more conductors per phase or neutral. Conductors

connecting the secondaries of transformers in accordance with 450.7 shall not be considered secondary ties.

As used in this section, the word *transformer* means a transformer or a bank of transformers operating as a unit.

**(A) Tie Circuits.** Tie circuits shall be provided with overcurrent protection at each end as required in Parts I, II, and VIII of Article 240.

Under the conditions described in 450.6(A)(1) and 450.6(A)(2), the overcurrent protection shall be permitted to be in accordance with 450.6(A)(3).

**(1) Loads at Transformer Supply Points Only.** Where all loads are connected at the transformer supply points at each end of the tie and overcurrent protection is not provided in accordance with Parts I, II, and VIII of Article 240, the rated ampacity of the tie shall not be less than 67 percent of the rated secondary current of the highest rated transformer supplying the secondary tie system.

**(2) Loads Connected Between Transformer Supply Points.** Where load is connected to the tie at any point between transformer supply points and overcurrent protection is not provided in accordance with Parts I, II, and VIII of Article 240, the rated ampacity of the tie shall not be less than 100 percent of the rated secondary current of the highest rated transformer supplying the secondary tie system.

*Exception: Tie circuits comprised of multiple conductors per phase shall be permitted to be sized and protected in accordance with 450.6(A)(4).*

**(3) Tie Circuit Protection.** Under the conditions described in 450.6(A)(1) and (A)(2), both supply ends of each ungrounded tie conductor shall be equipped with a protective device that opens at a predetermined temperature of the tie conductor under short-circuit conditions. This protection shall consist of one of the following: (1) a fusible link cable connector, terminal, or lug, commonly known as a limiter, each being of a size corresponding with that of the conductor and of construction and characteristics according to the operating voltage and the type of insulation on the tie conductors or (2) automatic circuit breakers actuated by devices having comparable time–current characteristics.

**(4) Interconnection of Phase Conductors Between Transformer Supply Points.** Where the tie consists of more than one conductor per phase or neutral, the conductors of each phase or neutral shall comply with one of the following provisions.

(a) *Interconnected.* The conductors shall be interconnected in order to establish a load supply point, and the protective device specified in 450.6(A)(3) shall be provided in

each ungrounded tie conductor at this point on both sides of the interconnection. The means of interconnection shall have an ampacity not less than the load to be served.

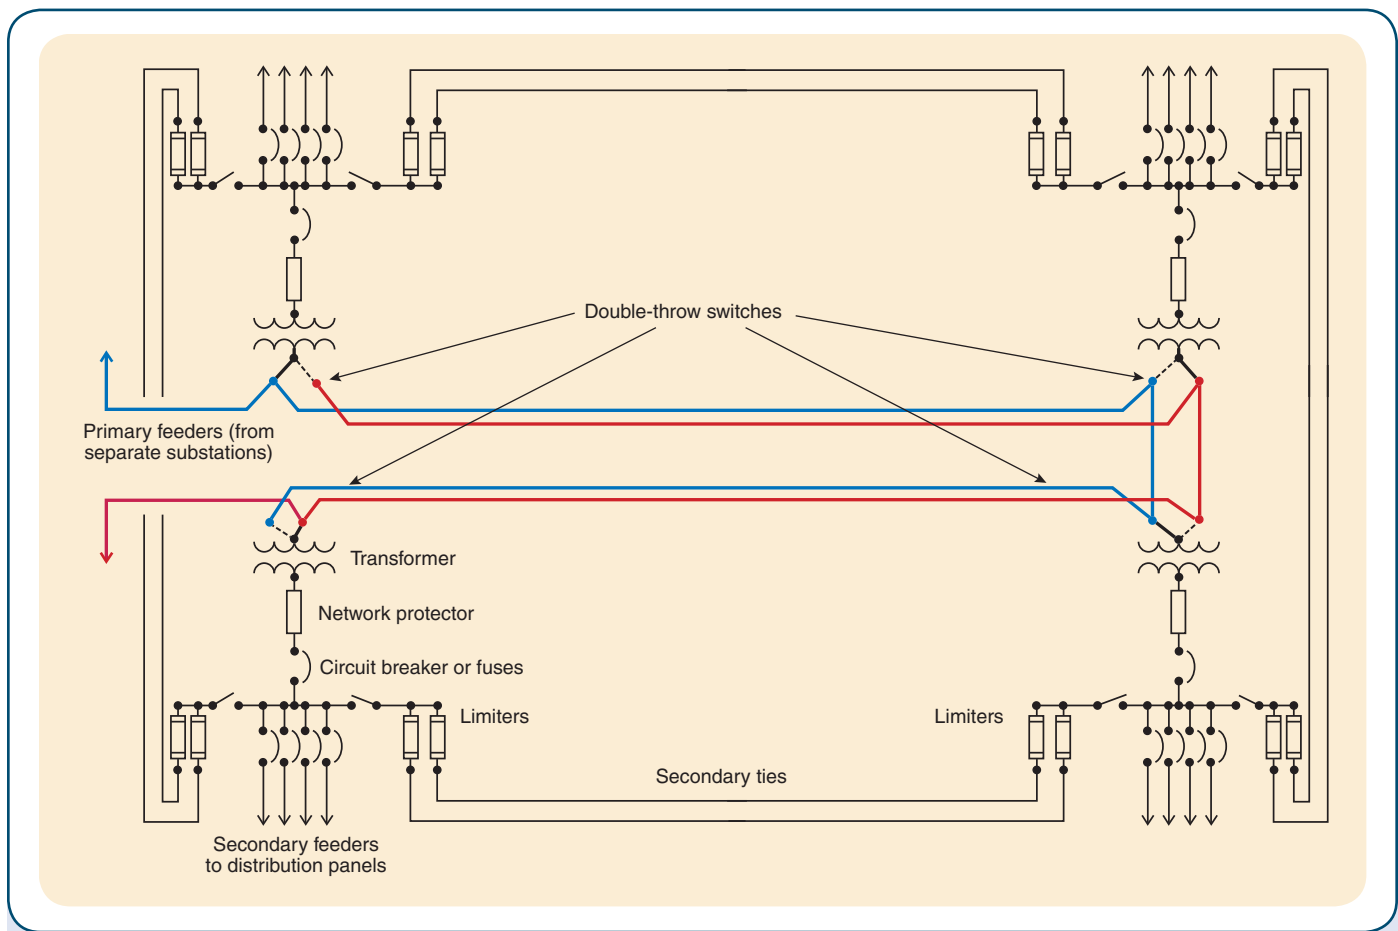

(b) *Not Interconnected.* The loads shall be connected to one or more individual conductors of a paralleled conductor tie without interconnecting the conductors of each phase or neutral and without the protection specified in 450.6(A)(3) at load connection points. Where this is done, the tie conductors of each phase or neutral shall have a combined capacity ampacity of not less than 133 percent of the rated secondary current of the highest rated transformer supplying the secondary tie system, the total load of such taps shall not exceed the rated secondary current of the highest rated transformer, and the loads shall be equally divided on each phase and on the individual conductors of each phase as far as practicable.

**(5) Tie Circuit Control.** Where the operating voltage exceeds 150 volts to ground, secondary ties provided with limiters shall have a switch at each end that, when open, de-energizes the associated tie conductors and limiters. The current rating of the switch shall not be less than the rated current ampacity of the conductors connected to the switch. It shall be capable of interrupting its rated current, and it shall be constructed so that it will not open under the magnetic forces resulting from short-circuit current.

**(B) Overcurrent Protection for Secondary Connections.** Where secondary ties are used, an overcurrent device rated or set at not more than 250 percent of the rated secondary current of the transformers shall be provided in the secondary connections of each transformer supplying the tie system. In addition, an automatic circuit breaker actuated by a reverse-current relay set to open the circuit at not more than the rated secondary current of the transformer shall be provided in the secondary connection of each transformer.

The requirements of 450.6 apply specifically to network systems for power distribution commonly employed where the load density is high and reliability of service is important. Such a system is illustrated in Exhibit 450.9. This type of distribution system introduces a variety of problems not encountered in the more common radial-type distribution system and must be designed by experienced electrical engineers. Exhibit 450.9 shows a typical 3-phase network system for an industrial plant fed by two primary feeders, preferably from separate substations, energized at any standard voltage up to 34,500 volts. Each of the transformers is supplied by the two primary feeders, which are arranged by means of a double-throw switch at the transformer so that the transformer may be supplied by either feeder.

Each of the network transformers is rated in the range of 300 to 1000 kilovolt-amperes (kVA) and is required to be

**EXHIBIT 450.9** A typical 3-phase network system for an industrial plant fed by two primary feeders.

protected as illustrated in Exhibit 450.10. The primary and secondary protection is in accordance with 450.3, but an additional protective device must be provided on the secondary side. This protective device is known as a *network protector* and consists of a circuit breaker and a reverse-current relay. The network protector operates on reverse current to prevent power from being fed back into the transformer through the secondary ties if a fault were to occur in the transformer or a primary feeder. The reverse-current relay is set to trip the circuit breaker at a current value not more than the rated secondary current of the transformer. The relay is not designed to trip the circuit breaker in the event of an overload on the secondary of the transformer.

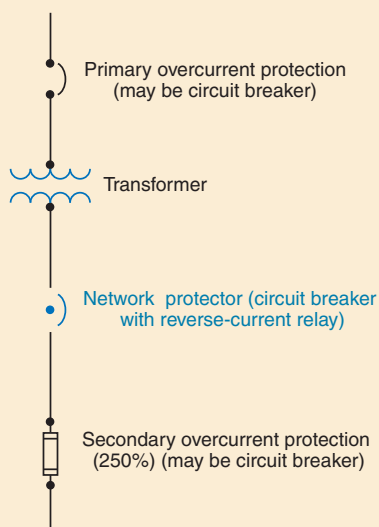

The secondary ties shown in Exhibit 450.9 must be protected at each end with an overcurrent device, in accordance with 450.6(A)(3). The overcurrent device most commonly provided for this purpose is a special type of fuse known as a *current limiter* and illustrated in Exhibit 450.11. This high-interrupting-capacity device is designed to provide short-circuit protection only for the secondary ties, which will

open safely before temperatures damaging to the cable insulation are reached. See 240.2 for the definition of *current-limiting overcurrent protective device* and its accompanying commentary. The secondary ties form a closed loop equipped with switching devices so that any part of the loop may be isolated when repairs are needed or a current limiter must be replaced.

**(C) Grounding.** Where the secondary tie system is grounded, each transformer secondary supplying the tie system shall be grounded in accordance with the requirements of 250.30 for separately derived systems.

### 450.7 Parallel Operation

Transformers shall be permitted to be operated in parallel and switched as a unit, provided the overcurrent protection for each transformer meets the requirements of 450.3(A) for primary and secondary protective devices over 600 volts, or 450.3(B) for primary and secondary protective devices 600 volts or less.

**EXHIBIT 450.10** Primary and secondary overcurrent protection for a transformer in a network system, showing a network protector (an automatic circuit breaker actuated by a reverse-current relay).

**EXHIBIT 450.11** A current limiter (a special type of high-interrupting-capacity fuse). (Courtesy of Ferraz Shawmut)

Parallel operation of transformers that are not switched as a unit can present dangerous backfeed situations for workers performing electrical maintenance. Appropriate lockout/

tagout procedures must be implemented during maintenance of electrical equipment operated or connected in parallel. See *NFPA 70E, Standard for Electrical Safety in the Workplace*, for safety-related work practices and appropriate lockout/tagout procedures.

### 450.8 Guarding

Transformers shall be guarded as specified in 450.8(A) through (D).

**(A) Mechanical Protection.** Appropriate provisions shall be made to minimize the possibility of damage to transformers from external causes where the transformers are exposed to physical damage.

One method of providing mechanical protection is to strategically place bollards around the transformer. This practice provides a degree of protection from vehicles.

**(B) Case or Enclosure.** Dry-type transformers shall be provided with a noncombustible moisture-resistant case or enclosure that provides protection against the accidental insertion of foreign objects.

**(C) Exposed Energized Parts.** Switches or other equipment operating at 600 volts, nominal, or less and serving only equipment within a transformer enclosure shall be permitted to be installed in the transformer enclosure if accessible to qualified persons only. All energized parts shall be guarded in accordance with 110.27 and 110.34.

**(D) Voltage Warning.** The operating voltage of exposed live parts of transformer installations shall be indicated by signs or visible markings on the equipment or structures.

### 450.9 Ventilation

The ventilation shall be adequate to dispose of the transformer full-load losses without creating a temperature rise that is in excess of the transformer rating.

Informational Note No. 1: See ANSI/IEEE C57.12.00-1993, *General Requirements for Liquid-Immersed Distribution, Power, and Regulating Transformers*, and ANSI/IEEE C57.12.01-1989, *General Requirements for Dry-Type Distribution and Power Transformers*.

Informational Note No. 2: Additional losses may occur in some transformers where nonsinusoidal currents are present, resulting in increased heat in the transformer above its rating. See ANSI/IEEE C57.110-1993, *Recommended Practice for Establishing Transformer Capability When Supplying Nonsinusoidal Load Currents*, where transformers are utilized with nonlinear loads.

Transformers with ventilating openings shall be installed so that the ventilating openings are not blocked by walls or other obstructions. The required clearances shall be clearly marked on the transformer.

Section 450.9 is intended to clarify that transformers are not permitted to be installed directly against walls or other obstructions that block openings for ventilation and that the required clearances should be clearly marked on the transformer (see 450.11).

Informational Note No. 2 following 450.9 warns of increased heating of transformers. See the commentary following 450.3, Informational Note No. 2, and the commentary following 310.15(B)(4) for additional information concerning nonlinear loads.

### 450.10 Grounding

Where grounded, exposed non-current-carrying metal parts of transformer installations, including fences, guards, and so forth, shall be grounded and bonded under the conditions and in the manner specified for electrical equipment and other exposed metal parts in Parts V, VI, and VII of Article 250.

### 450.11 Marking

Each transformer shall be provided with a nameplate giving the name of the manufacturer, rated kilovolt-amperes, frequency, primary and secondary voltage, impedance of transformers 25 kVA and larger, required clearances for transformers with ventilating openings, and the amount and kind of insulating liquid where used. In addition, the nameplate of each dry-type transformer shall include the temperature class for the insulation system.

The information given on a transformer nameplate is necessary to determine whether special precautions must be used pertaining to clearances for ventilation, overcurrent protection, or liquid confinement.

### 450.12 Terminal Wiring Space

The minimum wire-bending space at fixed, 600-volt and below terminals of transformer line and load connections shall be as required in 312.6. Wiring space for pigtail connections shall conform to Table 314.16(B).

The requirement in 450.12 ensures adequate wire-bending space at fixed terminals of transformer line and load connections rated 600 volts or less, because these are points of maximum mechanical and electrical stress on the conductor insulation.

### 450.13 Accessibility

All transformers and transformer vaults shall be readily accessible to qualified personnel for inspection and maintenance or shall meet the requirements of 450.13(A) or 450.13(B).

Transformers are not accessible if wiring methods or other equipment obstruct the access of a worker or prevent removal of the covers for inspection or maintenance. Practical clearance considerations required for removal and replacement of the transformer are also important.

**(A) Open Installations.** Dry-type transformers 600 volts, nominal, or less, located in the open on walls, columns, or structures, shall not be required to be readily accessible.

**(B) Hollow Space Installations.** Dry-type transformers 600 volts, nominal, or less and not exceeding 50 kVA shall be permitted in hollow spaces of buildings not permanently closed in by structure, provided they meet the ventilation requirements of 450.9 and separation from combustible materials requirements of 450.21(A). Transformers so installed shall not be required to be readily accessible.

Section 450.13(B) permits the installation of dry-type transformers rated 600 volts or less and not exceeding 50 kVA in hollow spaces of hung ceiling areas, provided these spaces are fire resistant, ventilated, and accessible. According to 300.22(C)(3), transformers are permitted to be installed in hollow spaces where the space is used for environmental air, provided the transformer is in a metal enclosure (ventilated or nonventilated) and the transformer is suitable for the ambient air temperature within the hollow space.

### 450.14 Disconnecting Means

Transformers, other than Class 2 or Class 3 transformers, shall have a disconnecting means located either in sight of the transformer or in a remote location. Where located in a remote location, the disconnecting means shall be lockable, and the location shall be field marked on the transformer.

This requirement is new in the 2011 *Code* to require a disconnecting means for a transformer. This requirement is intended to enhance safety for the qualified worker required to maintain the transformer. This enhanced safety is especially needed in installations utilizing the requirements of 240.21(B)(3) where there may be several transformers in different locations all tapped from one feeder and it may be impractical to de-energize the feeder to work on one of the transformers. The disconnect is required to be located within

sight from the transformer, but may be in a remote location if it is lockable. The location of any remote disconnect is required to be marked on the transformer.

## II. Specific Provisions Applicable to Different Types of Transformers

### 450.21 Dry-Type Transformers Installed Indoors

**(A) Not over 112½ kVA.** Dry-type transformers installed indoors and rated 112½ kVA or less shall have a separation of at least 300 mm (12 in.) from combustible material unless separated from the combustible material by a fire-resistant, heat-insulated barrier.

*Exception: This rule shall not apply to transformers rated for 600 volts, nominal, or less that are completely enclosed, with or without ventilating openings.*

**(B) Over 112½ kVA.** Individual dry-type transformers of more than 112½ kVA rating shall be installed in a transformer room of fire-resistant construction. Unless specified otherwise in this article, the term *fire resistant* means a construction having a minimum fire rating of 1 hour.

*Exception No. 1: Transformers with Class 155 or higher insulation systems and separated from combustible material by a fire-resistant, heat-insulating barrier or by not less than 1.83 m (6 ft) horizontally and 3.7 m (12 ft) vertically.*

*Exception No. 2: Transformers with Class 155 or higher insulation systems and completely enclosed except for ventilating openings.*

Dry-type transformers with a Class 155 or higher insulation system rating are not required to be installed in transformer rooms or vaults if space separation or a fire-resistant heat-insulating barrier is provided. Although these units are designed for higher operating temperatures, the need for a transformer vault is mitigated by the fire-resistant characteristics of high-temperature insulations.

Further information on specific transformer class insulation systems may be found in UL 1561, *Dry-Type General Purpose and Power Transformers*.

Informational Note: See ANSI/ASTM E119-1995, *Method for Fire Tests of Building Construction and Materials*, and NFPA 251-2006, *Standard Methods of Tests of Fire Resistance of Building Construction and Materials*.

**(C) Over 35,000 Volts.** Dry-type transformers rated over 35,000 volts shall be installed in a vault complying with Part III of this article.

Dry-type transformers depend on the surrounding air for adequate ventilation and, where rated 112½ kVA or less, are not required to be installed in a fire-resistant transformer room but must comply with 450.9.

Dry-type transformers, or gas-filled or less-flammable liquid-insulated transformers (see 450.23), installed indoors with a primary voltage of not more than 35,000 volts are commonly used because a transformer vault is not required.

For the same reason, askarel-filled transformers have been extensively used indoors in the past. Askarel, which contains polychlorinated biphenyl (PCB), is no longer being manufactured. Acceptable substitutes that comply with 450.23 are readily available.

Exhibit 450.12 shows a dry-type transformer with the outside casing in place and with the latest core and coil design for a typical dry-type power transformer rated at 1000 kVA, 13,800 volts to 480 volts, 3-phase, 60 Hz. This transformer has a high-voltage and low-voltage flange for connection to switchgear and a high-voltage, 2-position (double-throw), 3-pole-load air-break switch that may be attached to the case and arranged as a selector switch for connection of the transformer primary to either of two feeder sources.

**EXHIBIT 450.12** A dry-type transformer with a core and coil design rated at 1000 kVA, 13,800 volts to 480 volts, 3-phase, 60 Hz. Note cooling fans beneath each winding. (Courtesy of Schneider Electric)

Dry-type transformers rated 112½ kVA or less require 12 in. of separation from combustible material or separation by fire-resistant barriers. Transformers rated less than

600 volts and completely enclosed, except for ventilating openings, are exempt from this requirement unless the manufacturer's installation instructions specify clearance distances. Noncombustible insulations used in transformers, such as mica, porcelain, and glass, which can withstand high temperatures, have permitted the application of larger dry-type transformers. Combustible materials, however, such as varnishes, may have been used with those insulations, and, under short-circuit conditions, flames can escape from the transformer enclosure. Transformers rated over 112½ kVA must be located in fire-resistant transformer rooms or vaults unless either of the exceptions to 450.21(B) applies.

### 450.22 Dry-Type Transformers Installed Outdoors

Dry-type transformers installed outdoors shall have a weatherproof enclosure.

Transformers exceeding 112½ kVA shall not be located within 300 mm (12 in.) of combustible materials of buildings unless the transformer has Class 155 insulation systems or higher and is completely enclosed except for ventilating openings.

### 450.23 Less-Flammable Liquid-Insulated Transformers

Transformers insulated with listed less-flammable liquids that have a fire point of not less than 300°C shall be permitted to be installed in accordance with 450.23(A) or 450.23(B).

**(A) Indoor Installations.** Indoor installations shall be permitted in accordance with one of the following:

- (1) In Type I or Type II buildings, in areas where all of the following requirements are met:
  - a. The transformer is rated 35,000 volts or less.
  - b. No combustible materials are stored.
  - c. A liquid confinement area is provided.
  - d. The installation complies with all restrictions provided for in the listing of the liquid.
- (2) With an automatic fire extinguishing system and a liquid confinement area, provided the transformer is rated 35,000 volts or less
- (3) In accordance with 450.26

**(B) Outdoor Installations.** Less-flammable liquid-filled transformers shall be permitted to be installed outdoors, attached to, adjacent to, or on the roof of buildings, where installed in accordance with (1) or (2):

- (1) For Type I and Type II buildings, the installation shall comply with all restrictions provided for in the listing of the liquid.

Informational Note: Installations adjacent to combustible material, fire escapes, or door and window openings may require additional safeguards such as those listed in 450.27.

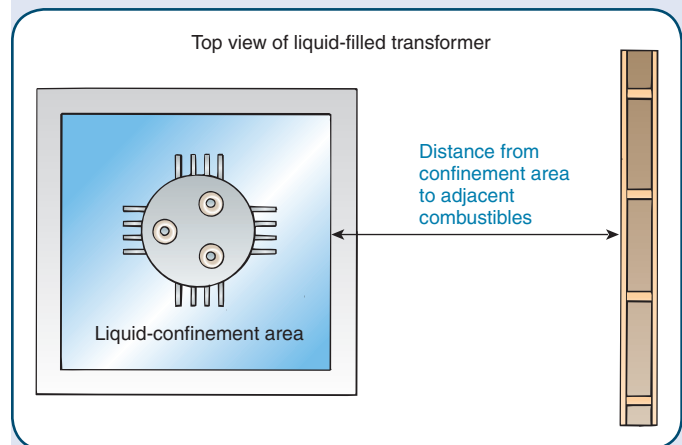

- (2) In accordance with 450.27.

Informational Note No. 1: As used in this section, *Type I and Type II buildings* refers to Type I and Type II building construction as defined in NFPA 220-2009, *Standard on Types of Building Construction*. *Combustible materials* refers to those materials not classified as noncombustible or limited-combustible as defined in NFPA 220-2009.

Informational Note No. 2: See definition of *Listed* in Article 100.

Two listing agencies — FM Global and Underwriters Laboratories Inc. — list less-flammable liquids for transformers. These liquids have a fire point of at least 300°C.

The FM Global listing is based on the use of a Factory Mutual Research-approved less-flammable fluid in a transformer tank that meets certain criteria. Pressure-relief devices must be provided. FM Global also recommends the use of enhanced electrical protection. Spacing from adjacent combustibles must be provided, based on the fluid capacity of the transformer tank, as illustrated in Exhibit 450.13. In the event of a leak, the liquid confinement area is intended to prevent transformer dielectric fluid from spreading beyond the vicinity of the transformer. Further information on applications may be found in the Factory Mutual Loss Prevention Data Sheet 5-4/14-8.

**EXHIBIT 450.13** A transformer tank containing an FM Global-listed less-flammable fluid, where the spacing from adjacent combustibles to the liquid confinement area is based on the capacity of the tank.

The Underwriters Laboratories Inc. listing is based on UL requirements that no tank rupture or noted fluid leakage occur during low- and high-current arcing fault tests. Further information may be obtained from the *UL Gas and Oil Equipment Directory*, under Transformer Fluids (EOVK), or from the manufacturer.

The requirements in 450.23 refer to buildings of Types I and II construction. The table in Informative Annex E is a summary of the requirements for construction types. The arabic numbers at the top of the fire resistance rating columns reflect the fire resistance ratings of the following building elements: exterior bearing walls; columns, beams, girders, trusses and arches, supporting bearing walls, columns, or loads from more than one floor; and the floor construction.

For example, a building of Type I, 443 construction has 4-hour fire-resistance-rated exterior bearing walls; 4-hour fire-resistance-rated columns, beams, girders, trusses, or arches; and 3-hour fire-resistance-rated floor construction. Whether a building is of Type I, Type II, or other type is determined by the requirements of the building construction code adopted by a jurisdiction.

#### 450.24 Nonflammable Fluid-Insulated Transformers

Transformers insulated with a dielectric fluid identified as nonflammable shall be permitted to be installed indoors or outdoors. Such transformers installed indoors and rated over 35,000 volts shall be installed in a vault. Such transformers installed indoors shall be furnished with a liquid confinement area and a pressure-relief vent. The transformers shall be furnished with a means for absorbing any gases generated by arcing inside the tank, or the pressure-relief vent shall be connected to a chimney or flue that will carry such gases to an environmentally safe area.

Informational Note: Safety may be increased if fire hazard analyses are performed for such transformer installations.

For the purposes of this section, a nonflammable dielectric fluid is one that does not have a flash point or fire point and is not flammable in air.

Section 450.24 requires a liquid confinement area and a pressure-relief vent for nonflammable fluid-insulated transformers. The liquid confinement area is intended to limit the extent of a spill if the tank leaks or ruptures. If a means for absorbing gases generated by arcing within the transformer is not provided, the pressure-relief vent must be connected to a chimney or flue that vents to an environmentally safe area.

The need for a gas absorption system or a chimney or flue that vents to an environmentally safe area is due to concerns about products generated during arcing. The high arc temperatures may cause the insulating medium to break down, resulting in the formation and emission of toxic or corrosive compounds.

#### 450.25 Askarel-Insulated Transformers Installed Indoors

Askarel-insulated transformers installed indoors and rated over 25 kVA shall be furnished with a pressure-relief vent. Where installed in a poorly ventilated place, they shall be furnished with a means for absorbing any gases generated by arcing inside the case, or the pressure-relief vent shall be connected to a chimney or flue that carries such gases outside the building. Askarel-insulated transformers rated over 35,000 volts shall be installed in a vault.

Askarel-insulated transformers are no longer manufactured. The information in the *Code* is for reference and for the modification of existing askarel-insulated installations.

#### 450.26 Oil-Insulated Transformers Installed Indoors

Oil-insulated transformers installed indoors shall be installed in a vault constructed as specified in Part III of this article.

*Exception No. 1: Where the total capacity does not exceed 112½ kVA, the vault specified in Part III of this article shall be permitted to be constructed of reinforced concrete that is not less than 100 mm (4 in.) thick.*

*Exception No. 2: Where the nominal voltage does not exceed 600, a vault shall not be required if suitable arrangements are made to prevent a transformer oil fire from igniting other materials and the total capacity in one location does not exceed 10 kVA in a section of the building classified as combustible or 75 kVA where the surrounding structure is classified as fire-resistant construction.*

*Exception No. 3: Electric furnace transformers that have a total rating not exceeding 75 kVA shall be permitted to be installed without a vault in a building or room of fire-resistant construction, provided suitable arrangements are made to prevent a transformer oil fire from spreading to other combustible material.*

*Exception No. 4: A transformer that has a total rating not exceeding 75 kVA and a supply voltage of 600 volts or less that is an integral part of charged-particle-accelerating equipment shall be permitted to be installed without a vault in a building or room of noncombustible or fire-resistant construction, provided suitable arrangements are made to prevent a transformer oil fire from spreading to other combustible material.*

*Exception No. 5: Transformers shall be permitted to be installed in a detached building that does not comply with Part III of this article if neither the building nor its contents present a fire hazard to any other building or property, and*

*if the building is used only in supplying electric service and the interior is accessible only to qualified persons.*

*Exception No. 6: Oil-insulated transformers shall be permitted to be used without a vault in portable and mobile surface mining equipment (such as electric excavators) if each of the following conditions is met:*

- (a) *Provision is made for draining leaking fluid to the ground.*
- (b) *Safe egress is provided for personnel.*
- (c) *A minimum 6-mm (1/4-in.) steel barrier is provided for personnel protection.*

### 450.27 Oil-Insulated Transformers Installed Outdoors

Combustible material, combustible buildings, and parts of buildings, fire escapes, and door and window openings shall be safeguarded from fires originating in oil-insulated transformers installed on roofs, attached to or adjacent to a building or combustible material.

In cases where the transformer installation presents a fire hazard, one or more of the following safeguards shall be applied according to the degree of hazard involved:

- (1) Space separations
- (2) Fire-resistant barriers
- (3) Automatic fire suppression systems
- (4) Enclosures that confine the oil of a ruptured transformer tank

Oil enclosures shall be permitted to consist of fire-resistant dikes, curbed areas or basins, or trenches filled with coarse, crushed stone. Oil enclosures shall be provided with trapped drains where the exposure and the quantity of oil involved are such that removal of oil is important.

**Informational Note:** For additional information on transformers installed on poles or structures or under ground, see ANSI C2-2007, *National Electrical Safety Code*.

### 450.28 Modification of Transformers

When modifications are made to a transformer in an existing installation that change the type of the transformer with respect to Part II of this article, such transformer shall be marked to show the type of insulating liquid installed, and the modified transformer installation shall comply with the applicable requirements for that type of transformer.

An existing askarel-insulated transformer may have the askarel replaced with either oil or a less-flammable liquid. Where such a modification takes place, the completed installation must have the same degree of safety as a new installation. For example, replacement of askarel with oil in an indoor installation without a vault may not be acceptable

(see 450.26 and its exceptions). The same is true if the replacement liquid is a less-flammable liquid (see 450.23). Additional safety precautions may be necessary to compensate for the different fire characteristics of the new dielectric fluid.

## III. Transformer Vaults

### 450.41 Location

Vaults shall be located where they can be ventilated to the outside air without using flues or ducts wherever such an arrangement is practicable.

### 450.42 Walls, Roofs, and Floors

The walls and roofs of vaults shall be constructed of materials that have adequate structural strength for the conditions with a minimum fire resistance of 3 hours. The floors of vaults in contact with the earth shall be of concrete that is not less than 100 mm (4 in.) thick, but where the vault is constructed with a vacant space or other stories below it, the floor shall have adequate structural strength for the load imposed thereon and a minimum fire resistance of 3 hours. For the purposes of this section, studs and wallboard construction shall not be acceptable.

*Exception: Where transformers are protected with automatic sprinkler, water spray, carbon dioxide, or halon, construction of 1-hour rating shall be permitted.*

**Informational Note No. 1:** For additional information, see ANSI/ASTM E119-1995, *Method for Fire Tests of Building Construction and Materials*, and NFPA 251-2006, *Standard Methods of Tests of Fire Resistance of Building Construction and Materials*.

**Informational Note No. 2:** A typical 3-hour construction is 150 mm (6 in.) thick reinforced concrete.

Vaults are intended primarily as passive fire protection. The need for vaults is dictated by the combustibility of the dielectric media and the size of the transformer. Transformers insulated with mineral oil have the greatest need for passive protection, to prevent the spread of burning oil to other combustible materials.

Although construction of a 3-hour-rated wall may be possible using studs and wallboard, this construction method is not permitted for transformer vaults because of the concern for containing projectiles created in a transformer explosion. A reduction in fire-resistance rating from 3 hours to 1 hour is permitted for vaults equipped with an automatic fire suppression system.

Askarel is no longer manufactured as a transformer-insulating fluid. Section 450.25 does not require existing

askarel-insulated transformers of 35,000 volts or less to be installed in vaults, because askarel is considered a noncombustible fluid. Transformers with a listed less-flammable liquid insulation may be installed without a vault, as permitted in 450.23. See the commentary following 450.23(B)(2), which relates to Type I and Type II building construction.

#### 450.43 Doorways

Vault doorways shall be protected in accordance with 450.43(A), (B), and (C).

**(A) Type of Door.** Each doorway leading into a vault from the building interior shall be provided with a tight-fitting door that has a minimum fire rating of 3 hours. The authority having jurisdiction shall be permitted to require such a door for an exterior wall opening where conditions warrant.

*Exception: Where transformers are protected with automatic sprinkler, water spray, carbon dioxide, or halon, construction of 1-hour rating shall be permitted.*

Informational Note: For additional information, see NFPA 80-2010, *Standard for Fire Doors and Other Opening Protectives*.

**(B) Sills.** A door sill or curb that is of sufficient height to confine the oil from the largest transformer within the vault shall be provided, and in no case shall the height be less than 100 mm (4 in.).

**(C) Locks.** Doors shall be equipped with locks, and doors shall be kept locked, access being allowed only to qualified persons. Personnel doors shall swing out and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.

Section 450.43 requires transformer vault doors to be locked but prohibits the use of conventional rotation-type door knobs. An injured worker attempting to escape from a transformer vault may not be able to operate a rotating-type door knob but would be able to escape through a door equipped with panic-type hardware.

#### 450.45 Ventilation Openings

Where required by 450.9, openings for ventilation shall be provided in accordance with 450.45(A) through (F).

**(A) Location.** Ventilation openings shall be located as far as possible from doors, windows, fire escapes, and combustible material.

**(B) Arrangement.** A vault ventilated by natural circulation of air shall be permitted to have roughly half of the total area

of openings required for ventilation in one or more openings near the floor and the remainder in one or more openings in the roof or in the sidewalls near the roof, or all of the area required for ventilation shall be permitted in one or more openings in or near the roof.

**(C) Size.** For a vault ventilated by natural circulation of air to an outdoor area, the combined net area of all ventilating openings, after deducting the area occupied by screens, gratings, or louvers, shall not be less than 1900 mm<sup>2</sup> (3 in.<sup>2</sup>) per kVA of transformer capacity in service, and in no case shall the net area be less than 0.1 m<sup>2</sup> (1 ft<sup>2</sup>) for any capacity under 50 kVA.

**(D) Covering.** Ventilation openings shall be covered with durable gratings, screens, or louvers, according to the treatment required in order to avoid unsafe conditions.

**(E) Dampers.** All ventilation openings to the indoors shall be provided with automatic closing fire dampers that operate in response to a vault fire. Such dampers shall possess a standard fire rating of not less than 1½ hours.

Informational Note: See ANSI/UL 555-1995, *Standard for Fire Dampers*.

**(F) Ducts.** Ventilating ducts shall be constructed of fire-resistant material.

#### 450.46 Drainage

Where practicable, vaults containing more than 100 kVA transformer capacity shall be provided with a drain or other means that will carry off any accumulation of oil or water in the vault unless local conditions make this impracticable. The floor shall be pitched to the drain where provided.

#### 450.47 Water Pipes and Accessories

Any pipe or duct system foreign to the electrical installation shall not enter or pass through a transformer vault. Piping or other facilities provided for vault fire protection, or for transformer cooling, shall not be considered foreign to the electrical installation.

Section 450.47 permits automatic sprinkler protection for transformer vaults. Piping or ductwork for cooling of the transformer is also permitted to be installed in a transformer vault. No other piping or ductwork is permitted to enter or pass through a transformer vault.

#### 450.48 Storage in Vaults

Materials shall not be stored in transformer vaults.

#### I. General

##### 455.1 Scope

This article covers the installation and use of phase converters.

A *phase converter* is an electrical device that converts single-phase electrical power to 3-phase for the operation of equipment that normally operates from a 3-phase electrical supply. Phase converters are of two types: *static*, with no moving parts, and *rotary*, with an internal rotor that must be rotating before a load is applied (see 455.2 for definitions of *rotary-phase converter* and *static-phase converter*).

Phase converters are most commonly used to supply 3-phase motor loads in locations where only single-phase power is available from the local utility. Electrical installations on farms and in other remote or rural areas are examples of such locations. Although their most common loads are motors, phase converters are increasingly used to supply

such loads as cellular telephone and other communication transmitter sites.

##### 455.2 Definitions

**Manufactured Phase.** The manufactured or derived phase originates at the phase converter and is not solidly connected to either of the single-phase input conductors.

**Phase Converter.** An electrical device that converts single-phase power to 3-phase electric power.

Informational Note: Phase converters have characteristics that modify the starting torque and locked-rotor current of motors served, and consideration is required in selecting a phase converter for a specific load.

**Rotary-Phase Converter.** A device that consists of a rotary transformer and capacitor panel(s) that permits the operation of 3-phase loads from a single-phase supply.

**Static-Phase Converter.** A device without rotating parts, sized for a given 3-phase load to permit operation from a single-phase supply.

##### 455.3 Other Articles

Phase converters shall comply with this article and with the applicable provisions of other articles of this *Code*.

##### 455.4 Marking

Each phase converter shall be provided with a permanent nameplate indicating the following:

- (1) Manufacturer's name
- (2) Rated input and output voltages
- (3) Frequency
- (4) Rated single-phase input full-load amperes
- (5) Rated minimum and maximum single load in kilovolt-amperes (kVA) or horsepower
- (6) Maximum total load in kilovolt-amperes (kVA) or horsepower
- (7) For a rotary-phase converter, 3-phase amperes at full load

##### 455.5 Equipment Grounding Connection

A means for attachment of an equipment grounding conductor termination in accordance with 250.8 shall be provided.

##### 455.6 Conductors

**(A) Ampacity.** The ampacity of the single-phase supply conductors shall be determined by 455.6(A)(1) or (A)(2).

Informational Note: Single-phase conductors sized to prevent a voltage drop not exceeding 3 percent from the source of supply to the phase converter may help ensure proper starting and operation of motor loads.

**(1) Variable Loads.** Where the loads to be supplied are variable, the conductor ampacity shall not be less than 125 percent of the phase converter nameplate single-phase input full-load amperes.

**(2) Fixed Loads.** Where the phase converter supplies specific fixed loads, and the conductor ampacity is less than 125 percent of the phase converter nameplate single-phase input full-load amperes, the conductors shall have an ampacity not less than 250 percent of the sum of the full-load, 3-phase current rating of the motors and other loads served where the input and output voltages of the phase converter are identical. Where the input and output voltages of the phase converter are different, the current as determined by this section shall be multiplied by the ratio of output to input voltage.

**(B) Manufactured Phase Marking.** The manufactured phase conductors shall be identified in all accessible locations with a distinctive marking. The marking shall be consistent throughout the system and premises.

### 455.7 Overcurrent Protection

The single-phase supply conductors and phase converter shall be protected from overcurrent by 455.7(A) or (B). Where the required fuse or nonadjustable circuit breaker rating or settings of adjustable circuit breakers do not correspond to a standard rating or setting, a higher rating or setting that does not exceed the next higher standard rating shall be permitted.

**(A) Variable Loads.** Where the loads to be supplied are variable, overcurrent protection shall be set at not more than 125 percent of the phase converter nameplate single-phase input full-load amperes.

**(B) Fixed Loads.** Where the phase converter supplies specific fixed loads and the conductors are sized in accordance with 455.6(A)(2), the conductors shall be protected in accordance with their ampacity. The overcurrent protection determined from this section shall not exceed 125 percent of the phase converter nameplate single-phase input amperes.

### 455.8 Disconnecting Means

Means shall be provided to disconnect simultaneously all ungrounded single-phase supply conductors to the phase converter.

**(A) Location.** The disconnecting means shall be readily accessible and located in sight from the phase converter.

**(B) Type.** The disconnecting means shall be a switch rated in horsepower, a circuit breaker, or a molded-case switch. Where only nonmotor loads are served, an ampere-rated switch shall be permitted.

**(C) Rating.** The ampere rating of the disconnecting means shall not be less than 115 percent of the rated maximum single-phase input full-load amperes or, for specific fixed loads, shall be permitted to be selected from 455.8(C)(1) or (C)(2).

**(1) Current Rated Disconnect.** The disconnecting means shall be a circuit breaker or molded-case switch with an ampere rating not less than 250 percent of the sum of the following:

- (1) Full-load, 3-phase current ratings of the motors
- (2) Other loads served

**(2) Horsepower Rated Disconnect.** The disconnecting means shall be a switch with a horsepower rating. The equivalent locked rotor current of the horsepower rating of the switch shall not be less than 200 percent of the sum of the following:

- (1) Nonmotor loads
- (2) The 3-phase, locked-rotor current of the largest motor as determined from Table 430.251(B)
- (3) The full-load current of all other 3-phase motors operating at the same time

**(D) Voltage Ratios.** The calculations in 455.8(C) shall apply directly where the input and output voltages of the phase converter are identical. Where the input and output voltages of the phase converter are different, the current shall be multiplied by the ratio of the output to input voltage.

### 455.9 Connection of Single-Phase Loads

Where single-phase loads are connected on the load side of a phase converter, they shall not be connected to the manufactured phase.

### 455.10 Terminal Housings

A terminal housing in accordance with the provisions of 430.12 shall be provided on a phase converter.

## II. Specific Provisions Applicable to Different Types of Phase Converters

### 455.20 Disconnecting Means

The single-phase disconnecting means for the input of a static phase converter shall be permitted to serve as the disconnecting means for the phase converter and a single load if the load is within sight of the disconnecting means.

### 455.21 Start-Up

Power to the utilization equipment shall not be supplied until the rotary-phase converter has been started.

### 455.22 Power Interruption

Utilization equipment supplied by a rotary-phase converter shall be controlled in such a manner that power to the equipment will be disconnected in the event of a power interruption.

Informational Note: Magnetic motor starters, magnetic contactors, and similar devices, with manual or time delay restarting for the load, provide restarting after power interruption.

### 455.23 Capacitors

Capacitors that are not an integral part of the rotary-phase conversion system but are installed for a motor load shall be connected to the line side of that motor overload protective device.

### 460.1 Scope

This article covers the installation of capacitors on electrical circuits.

Surge capacitors or capacitors included as a component part of other apparatus and conforming with the requirements of such apparatus are excluded from these requirements.

This article also covers the installation of capacitors in hazardous (classified) locations as modified by Articles 501 through 503.

### 460.2 Enclosing and Guarding

**(A) Containing More Than 11 L (3 gal) of Flammable Liquid.** Capacitors containing more than 11 L (3 gal) of flammable liquid shall be enclosed in vaults or outdoor fenced enclosures complying with Article 110, Part III. This limit shall apply to any single unit in an installation of capacitors.

**(B) Accidental Contact.** Where capacitors are accessible to unauthorized and unqualified persons, they shall be enclosed, located, or guarded so that persons cannot come into accidental contact or bring conducting materials into accidental contact with exposed energized parts, terminals, or buses associated with them. However, no additional guarding is required for enclosures accessible only to authorized and qualified persons.

## I. 600 Volts, Nominal, and Under

### 460.6 Discharge of Stored Energy

Capacitors shall be provided with a means of discharging stored energy.

**(A) Time of Discharge.** The residual voltage of a capacitor shall be reduced to 50 volts, nominal, or less within 1 minute after the capacitor is disconnected from the source of supply.

**(B) Means of Discharge.** The discharge circuit shall be either permanently connected to the terminals of the capacitor or capacitor bank or provided with automatic means of connecting it to the terminals of the capacitor bank on removal of voltage from the line. Manual means of switching or connecting the discharge circuit shall not be used.

### 460.8 Conductors

**(A) Ampacity.** The ampacity of capacitor circuit conductors shall not be less than 135 percent of the rated current of the capacitor. The ampacity of conductors that connect a capacitor to the terminals of a motor or to motor circuit conductors shall not be less than one-third the ampacity of the

motor circuit conductors and in no case less than 135 percent of the rated current of the capacitor.

**(B) Overcurrent Protection.** An overcurrent device shall be provided in each ungrounded conductor for each capacitor bank. The rating or setting of the overcurrent device shall be as low as practicable.

Except as permitted in the exception to 460.8(B), it is intended that the overcurrent device be separate from the overcurrent device protecting any other equipment or conductor. See Exhibit 460.1, diagrams (a) and (b).

*Exception: A separate overcurrent device shall not be required for a capacitor connected on the load side of a motor overload protective device.*

**(C) Disconnecting Means.** A disconnecting means shall be provided in each ungrounded conductor for each capacitor bank and shall meet the following requirements:

- (1) The disconnecting means shall open all ungrounded conductors simultaneously.
- (2) The disconnecting means shall be permitted to disconnect the capacitor from the line as a regular operating procedure.
- (3) The rating of the disconnecting means shall not be less than 135 percent of the rated current of the capacitor.

*Exception: A separate disconnecting means shall not be required where a capacitor is connected on the load side of a motor controller.*

Capacitors are rated in reactive kilovolt-amperes, or kilovars, which is abbreviated “kVAR.” Sometimes capacitors are rated in kilovolt amperes capacitive (kVAc). Both ratings are synonymous. The kVAR rating shows how many reactive kilovolt-amperes the capacitor will supply to cancel out the reactive kilovolt-amperes caused by inductance. For example, a 20-kVAR capacitor will cancel out 20 kVAR of inductive reactive kilovolt-amperes.

The basic capacitor is 3-phase and delta-connected internally, but single-phase and 2-phase units are also available. The capacitors are constructed with built-in fuses for short-circuit protection and discharge resistors that reduce the voltage to a 50-volt crest or less when disconnected from the power supply. This occurs within 1 minute on 600-volt units and within 5 minutes on 2400- and 4160-volt units.

The capacitor circuit conductors and disconnecting means must have an ampacity not less than 135 percent of the rated current of the capacitor. The reason is that all ca-

pacitors are manufactured with a tolerance of zero percent to 15 percent, so a 100-kVAR capacitor may actually draw a current equivalent to that of a 115-kVAR capacitor. In addition, the current drawn by a capacitor varies directly with the line voltage, and any variation in the line voltage from a pure sine wave form causes the capacitor to draw an increased current. Considering these several factors, the increased current can amount to 135 percent of the rated current of the capacitor.

The current corresponding to the kVAR rating of a 3-phase capacitor,  $I_c$ , is computed from the following formula:

$$I_c = \frac{\text{kVAR} \times 1000}{1.73 \times \text{volts}}$$

The ampacity of the conductors and the switching device is then determined by multiplying  $I_c$  by 1.35. The most effective power factor correction is obtained where the individual capacitors are connected closest to the inductive load.

Capacitor manufacturers publish tables in which the required capacitor value is obtained by referring to the speed and the horsepower of the motor. These values improve the motor power factor to approximately 95 percent. To improve a plant power factor, capacitor manufacturers also publish tables to assist in calculating the total kVAR rating of capacitors required to improve the power factor to any desired value.

Care should be given to using capacitors where harmonic-producing loads are present. Adding capacitors to an electrical system can place the system in a harmonic resonance condition. The harmonic loads can excite the electrical system at the harmonic resonance frequency and cause overcurrent and overvoltage conditions. If capacitors are to be placed on electrical systems with harmonic loads, an engineering study that evaluates the size and placement of capacitors and the reactive impedance and load of the system should be conducted. Capacitors may need a reactor placed in series with them to help detune the electrical system from a harmonic resonance condition.

## 460.9 Rating or Setting of Motor Overload Device

Where a motor installation includes a capacitor connected on the load side of the motor overload device, the rating or setting of the motor overload device shall be based on the improved power factor of the motor circuit.

The effect of the capacitor shall be disregarded in determining the motor circuit conductor rating in accordance with 430.22.

Where a capacitor is connected on the load side of the motor overload relays [see Exhibit 460.1, diagram (a)], the

line current will be reduced due to an improved power factor, which must be taken into account when selecting the rating of a motor overload device. A value lower than that specified in 430.32 should be used for proper protection of the motor.

### 460.10 Grounding

Capacitor cases shall be connected to the equipment grounding conductor.

*Exception: Capacitor cases shall not be connected to the equipment grounding conductor where the capacitor units are supported on a structure designed to operate at other than ground potential.*

### 460.12 Marking

Each capacitor shall be provided with a nameplate giving the name of the manufacturer, rated voltage, frequency, kilovar or amperes, number of phases, and, if filled with a combustible liquid, the volume of liquid. Where filled with a nonflammable liquid, the nameplate shall so state. The nameplate shall also indicate whether a capacitor has a discharge device inside the case.

## II. Over 600 Volts, Nominal

### 460.24 Switching

**(A) Load Current.** Group-operated switches shall be used for capacitor switching and shall be capable of the following:

- (1) Carrying continuously not less than 135 percent of the rated current of the capacitor installation
- (2) Interrupting the maximum continuous load current of each capacitor, capacitor bank, or capacitor installation that will be switched as a unit
- (3) Withstanding the maximum inrush current, including contributions from adjacent capacitor installations
- (4) Carrying currents due to faults on capacitor side of switch

**(B) Isolation.**

**(1) General.** A means shall be installed to isolate from all sources of voltage each capacitor, capacitor bank, or capacitor installation that will be removed from service as a unit. The isolating means shall provide a visible gap in the electrical circuit adequate for the operating voltage.

**(2) Isolating or Disconnecting Switches with No Interrupting Rating.** Isolating or disconnecting switches (with no interrupting rating) shall be interlocked with the load-interrupting device or shall be provided with prominently

displayed caution signs in accordance with 490.22 to prevent switching load current.

**(C) Additional Requirements for Series Capacitors.** The proper switching sequence shall be ensured by use of one of the following:

- (1) Mechanically sequenced isolating and bypass switches
- (2) Interlocks
- (3) Switching procedure prominently displayed at the switching location

### 460.25 Overcurrent Protection

**(A) Provided to Detect and Interrupt Fault Current.** A means shall be provided to detect and interrupt fault current likely to cause dangerous pressure within an individual capacitor.

**(B) Single Pole or Multipole Devices.** Single-pole or multipole devices shall be permitted for this purpose.

**(C) Protected Individually or in Groups.** Capacitors shall be permitted to be protected individually or in groups.

**(D) Protective Devices Rated or Adjusted.** Protective devices for capacitors or capacitor equipment shall be rated or adjusted to operate within the limits of the safe zone for individual capacitors. If the protective devices are rated or adjusted to operate within the limits for Zone 1 or Zone 2, the capacitors shall be enclosed or isolated.

In no event shall the rating or adjustment of the protective devices exceed the maximum limit of Zone 2.

*Informational Note: For definitions of Safe Zone, Zone 1, and Zone 2, see ANSI/IEEE 18-1992, Shunt Power Capacitors.*

### 460.26 Identification

Each capacitor shall be provided with a permanent nameplate giving the manufacturer's name, rated voltage, frequency, kilovar or amperes, number of phases, and the volume of liquid identified as flammable, if such is the case.

### 460.27 Grounding

Capacitor cases shall be connected to the equipment grounding conductor. If the capacitor neutral point is connected to a grounding electrode conductor, the connection shall be made in accordance with Part III of Article 250.

*Exception: Capacitor cases shall not be connected to the equipment grounding conductor where the capacitor units are supported on a structure designed to operate at other than ground potential.*

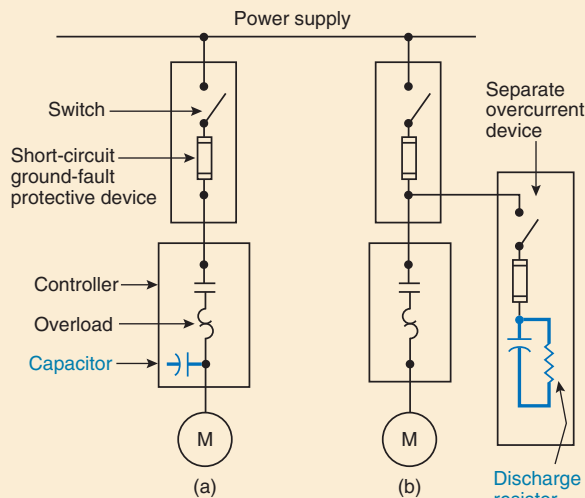

### 460.28 Means for Discharge

**(A) Means to Reduce the Residual Voltage.** A means shall be provided to reduce the residual voltage of a capacitor to 50 volts or less within 5 minutes after the capacitor is disconnected from the source of supply.

**(B) Connection to Terminals.** A discharge circuit shall be either permanently connected to the terminals of the capacitor or provided with automatic means of connecting it to the terminals of the capacitor bank after disconnection of the capacitor from the source of supply. The windings of motors, transformers, or other equipment directly connected to capacitors without a switch or overcurrent device interposed shall meet the requirements of 460.28(A).

Means are required to drain off the stored charge in a capacitor after the supply circuit has been opened. Otherwise, a person servicing the equipment could receive a severe shock, or damage could occur to the equipment.

Exhibit 460.1, diagram (a), shows a method in which capacitors are connected in a motor circuit so that they may be switched with the motor. In this arrangement, the stored charge drains off through the windings when the circuit is opened. Diagram (b) shows another arrangement in which the capacitor is connected to the line side of the motor starter contacts. An automatic discharge device and a separate disconnecting means are required. As shown in Exhibit 460.2, capacitors are often equipped with built-in resistors to drain off the stored charge, although this type

**EXHIBIT 460.1** Methods of connecting capacitors in induction motor circuit for power factor correction.

**EXHIBIT 460.2** Power factor correction capacitors with internal discharge resistors (blue) and overcurrent protection. (Courtesy of GE Energy)

of capacitor is not needed where connected as shown in Exhibit 460.1, diagram (a).

### I. 600 Volts, Nominal, and Under

#### 470.1 Scope

This article covers the installation of separate resistors and reactors on electrical circuits.

*Exception: Resistors and reactors that are component parts of other apparatus.*

This article also covers the installation of resistors and reactors in hazardous (classified) locations as modified by Articles 501 through 504.

Resistors are made in many sizes and shapes and for different purposes. They may be wire or ribbon wound, form wound, edgewise wound, cast grid, punched steel grid, or box resistors. They may be mounted in the open or in ventilated metal boxes or cabinets, depending on their use and location. Because they give off heat, resistors must be guarded and located at safe distances from combustible materials. Where mounted on switchboards or installed in control panels, they are not required to have additional guards.

Current-limiting reactors are installed to limit the amount of current that can flow in a circuit when a short circuit occurs. Reactors can be divided into two classes: those with iron cores and those with no magnetic materials in the windings. Either type may be air cooled or oil immersed.

Mechanical stresses exist between adjacent air-core reactors due to their external fields, and the manufacturer's recommendations should be followed in spacing and bracing units and fastening supporting insulators.

Saturable reactors may be used for theater dimming [see 520.25(A) and commentary]. These reactors have, in addition to the ac winding, an auxiliary winding connected line-to-line or line-to-ground, to neutralize charging current and prevent a voltage rise. Those reactors used on high-voltage systems may be oil immersed.

## 470.2 Location

Resistors and reactors shall not be placed where exposed to physical damage.

## 470.3 Space Separation

A thermal barrier shall be required if the space between the resistors and reactors and any combustible material is less than 305 mm (12 in.).

## 470.4 Conductor Insulation

Insulated conductors used for connections between resistance elements and controllers shall be suitable for an operating temperature of not less than 90°C (194°F).

*Exception: Other conductor insulations shall be permitted for motor starting service.*

# II. Over 600 Volts, Nominal

## 470.18 General

**(A) Protected Against Physical Damage.** Resistors and reactors shall be protected against physical damage.

**(B) Isolated by Enclosure or Elevation.** Resistors and reactors shall be isolated by enclosure or elevation to protect personnel from accidental contact with energized parts.

**(C) Combustible Materials.** Resistors and reactors shall not be installed in close enough proximity to combustible materials to constitute a fire hazard and shall have a clearance of not less than 305 mm (12 in.) from combustible materials.

**(D) Clearances.** Clearances from resistors and reactors to grounded surfaces shall be adequate for the voltage involved.

Informational Note: See Article 490.

**(E) Temperature Rise from Induced Circulating Currents.** Metallic enclosures of reactors and adjacent metal parts shall be installed so that the temperature rise from induced circulating currents is not hazardous to personnel or does not constitute a fire hazard.

## 470.19 Grounding

Resistor and reactor cases or enclosures shall be connected to the equipment grounding conductor.

*Exception: Resistor or reactor cases or enclosures supported on a structure designed to operate at other than ground potential shall not be connected to the equipment grounding conductor.*

## 470.20 Oil-Filled Reactors

Installation of oil-filled reactors, in addition to the above requirements, shall comply with applicable requirements of Article 450.

- 480.10 Vents
  - (A) Vented Cells
  - (B) Sealed Cells

### 480.1 Scope

The provisions of this article shall apply to all stationary installations of storage batteries.

There are many types of batteries. The two most common types of storage cells are the *lead-acid* type and the *alkali* (nickel-cadmium) type. A lead-acid cell consists of a positive plate, usually lead peroxide (a semisolid compound) mounted on a framework or grid for support, and a negative plate, made of sponge lead mounted on a grid. Grids are generally made of a lead alloy, such as lead-calcium, lead-antimony, or lead-selenium. The electrolyte is sulfuric acid and distilled water.

Lead-acid cells may be of the vented or sealed (valve-regulated) type. Under normal charging conditions, the vented type will liberate gases: hydrogen at the negative plate and oxygen at the positive plate. The valve-regulated type provides a means to recombine this gas, thus minimizing emissions from the cell.

In the alkali, or nickel-cadmium, battery the principal active material in the positive plate is nickelous hydroxide; in the negative plate, it is cadmium hydroxide. The electrolyte is potassium hydroxide (an alkali).

In stationary installations, nickel-cadmium cells are generally of the vented type and liberate hydrogen and oxygen during normal charging. Hermetically sealed nickel-cadmium cells are sometimes used, but they require special charging equipment to prevent gas emissions.

### 480.2 Definitions

**Battery System.** Interconnected battery subsystems consisting of one or more storage batteries and battery chargers, and can include inverters, converters, and associated electrical equipment.

This definition was added in the 2011 *Code*. The term *battery system* is used in several places within Article 480. This definition is suitable for all types of batteries, including

lead-acid batteries. The “system” consists of all of the major components that are necessary to supply the desired output. A battery system can actually consist of multiple “batteries.” A battery system will always contain, as a minimum, one or more batteries and one or more battery chargers. Other equipment, such as inverters, converters, and electrical equipment, may or may not always be present.

**Nominal Battery Voltage.** The voltage of a battery based on the number and type of cells in the battery.

**Informational Note:** The most common nominal cell voltages are 2 volts per cell for the lead-acid systems, 1.2 volts per cell for alkali systems, and 4 volts per cell for Li-ion systems. Nominal voltages might vary with different chemistries.

**Sealed Cell or Battery.** A cell or battery that has no provision for the routine addition of water or electrolyte or for external measurement of electrolyte specific gravity and might contain pressure relief venting.

**Storage Battery.** A battery comprised of one or more rechargeable cells of the lead-acid, nickel-cadmium, or other rechargeable electrochemical types.

### 480.3 Wiring and Equipment Supplied from Batteries

Wiring and equipment supplied from storage batteries shall be subject to the applicable provisions of this *Code* applying to wiring and equipment operating at the same voltage, unless otherwise permitted by 480.4.

### 480.4 Overcurrent Protection for Prime Movers

Overcurrent protection shall not be required for conductors from a battery rated less than 50 volts if the battery provides power for starting, ignition, or control of prime movers. Section 300.3 shall not apply to these conductors.

The overcurrent protection requirements of Article 240 do not apply to field-installed conductors used for starting, ignition, or control of prime movers, provided that the supply source for these conductors is a battery rated less than 50 volts. In addition, the requirement to use single conductors only in conjunction with a Chapter 3 wiring method is not applicable to battery-powered conductors. For example, if it were necessary at a generator location to extend the conductors from the battery to the prime mover starting solenoid, these conductors would not be required to have overcurrent protection and could be run as open, single conductors.

### 480.5 Disconnecting Means

A disconnecting means shall be provided for all ungrounded conductors derived from a stationary battery system over 50 volts. A disconnecting means shall be readily accessible and located within sight of the battery system.

A battery disconnecting means is needed to allow the battery to be disconnected for maintenance. This requirement also correlates with 240.21(H), which addresses the location of overcurrent protection devices for battery conductors.

Informational Note: See 240.21(H) for information on the location of the overcurrent device for battery conductors.

### 480.6 Insulation of Batteries Not Over 250 Volts

This section shall apply to storage batteries having cells connected so as to operate at a nominal battery voltage of not over 250 volts.

**(A) Vented Lead-Acid Batteries.** Cells and multi-cell batteries with covers sealed to containers of nonconductive, heat-resistant material shall not require additional insulating support.

**(B) Vented Alkaline-Type Batteries.** Cells with covers sealed to jars of nonconductive, heat-resistant material shall require no additional insulation support. Cells in jars of conductive material shall be installed in trays of nonconductive material with not more than 20 cells (24 volts, nominal) in the series circuit in any one tray.

**(C) Rubber Jars.** Cells in rubber or composition containers shall require no additional insulating support where the total nominal voltage of all cells in series does not exceed 150 volts. Where the total voltage exceeds 150 volts, batteries shall be sectionalized into groups of 150 volts or less, and each group shall have the individual cells installed in trays or on racks.

**(D) Sealed Cells or Batteries.** Sealed cells and multicompart ment sealed batteries constructed of nonconductive, heat-resistant material shall not require additional insulating support. Batteries constructed of a conducting container shall have insulating support if a voltage is present between the container and ground.

### 480.7 Insulation of Batteries of over 250 Volts

The provisions of 480.6 shall apply to storage batteries having the cells connected so as to operate at a nominal voltage exceeding 250 volts, and, in addition, the provisions of this section shall also apply to such batteries. Cells shall be in-

stalled in groups having a total nominal voltage of not over 250 volts. Insulation, which can be air, shall be provided between groups and shall have a minimum separation between live battery parts of opposite polarity of 50 mm (2 in.) for battery voltages not exceeding 600 volts.

### 480.8 Racks and Trays

Racks and trays shall comply with 480.8(A) and (B).

**(A) Racks.** Racks, as required in this article, are rigid frames designed to support cells or trays. They shall be substantial and be made of one of the following:

- (1) Metal, treated so as to be resistant to deteriorating action by the electrolyte and provided with nonconducting members directly supporting the cells or with continuous insulating material other than paint on conducting members
- (2) Other construction such as fiberglass or other suitable nonconductive materials

**(B) Trays.** Trays are frames, such as crates or shallow boxes usually of wood or other nonconductive material, constructed or treated so as to be resistant to deteriorating action by the electrolyte.

### 480.9 Battery Locations

Battery locations shall conform to 480.9(A), (B), and (C).

**(A) Ventilation.** Provisions shall be made for sufficient diffusion and ventilation of the gases from the battery to prevent the accumulation of an explosive mixture.

Compliance with 480.9(A) is necessary to prevent classification of a battery location as a hazardous (classified) location, in accordance with Article 500.

The intent of 480.9(A) is not to mandate mechanical ventilation. Hydrogen disperses rapidly and requires little air movement to prevent accumulation. Unrestricted natural air movement in the vicinity of the battery, together with normal air changes for occupied spaces or heat removal, normally is sufficient. If the space is confined, mechanical ventilation may be required in the vicinity of the battery.

Hydrogen is lighter than air and tends to concentrate at ceiling level, so some form of ventilation should be provided at the upper portion of the structure. Ventilation can be a fan, roof ridge vent, or louvered area.

Although valve-regulated batteries are often referred to as “sealed,” they actually emit very small quantities of hydrogen gas under normal operation and are capable of liberating large quantities of explosive gases if overcharged. These batteries therefore require the same amount of ventilation as their vented counterparts.

**(B) Live Parts.** Guarding of live parts shall comply with 110.27.

Batteries should be located in clean, dry rooms and be arranged to provide sufficient work space for inspection and maintenance. Provisions must also be made for adequate ventilation, to prevent an accumulation of an explosive mixture of the gases from the batteries.

The fumes given off by some storage batteries are very corrosive; therefore, wiring and its insulation must be of a type that withstands corrosive action [see 310.10(G)]. Special precautions are necessary to ensure that all metalwork (metal raceways, metal racks, etc.) is designed or treated to be corrosion resistant. The battery racks shown in Exhibit 480.1 are coated with a nonmetallic outer covering as required by 480.8(A) that insulates and provides protection against the corrosive action of fumes from charging batteries and any electrolyte that may escape from the cells. Manufacturers sometimes suggest that aluminum or plastic conduit be used to withstand the corrosive battery fumes, or, if steel conduit is used, that it be zinc coated and corrosion protected with a coating of an asphaltum-type paint (see 300.6).

**EXHIBIT 480.1** A well-arranged battery room with batteries installed on corrosion-resistant racks. (Courtesy of the International Association of Electrical Inspectors)

Overcharging heats a battery and causes gassing and loss of water. A battery should not be allowed to reach temperatures over 110°F, because heat causes a shedding of active materials from the plates, which will eventually form a sediment buildup in the bottom of the case and short-circuit the plates and the cell. Because mixtures of oxygen and hydrogen are highly explosive, flame or sparks should never be allowed near a cell, especially if the filler cap is removed.

**(C) Working Space.** Working space about the battery systems shall comply with 110.26. Working clearance shall be measured from the edge of the battery rack.

### 480.10 Vents

**(A) Vented Cells.** Each vented cell shall be equipped with a flame arrester that is designed to prevent destruction of the cell due to ignition of gases within the cell by an external spark or flame under normal operating conditions.

**(B) Sealed Cells.** Sealed battery or cells shall be equipped with a pressure-release vent to prevent excessive accumulation of gas pressure, or the battery or cell shall be designed to prevent scatter of cell parts in event of a cell explosion.

## I. General

### 490.1 Scope

This article covers the general requirements for equipment operating at more than 600 volts, nominal.

Informational Note No. 1: See NFPA 70E-2009, *Standard for Electrical Safety in the Workplace*, for electrical safety requirements for employee workplaces.

Informational Note No. 2: For further information on hazard signs and labels, see ANSI Z535.4-1998, *Product Signs and Safety Labels*.

### 490.2 Definition

**High Voltage.** For the purposes of this article, more than 600 volts, nominal.

### 490.3 Oil-Filled Equipment

Installation of electrical equipment, other than transformers covered in Article 450, containing more than 38 L (10 gal) of flammable oil per unit shall meet the requirements of Parts II and III of Article 450.

## II. Equipment — Specific Provisions

### 490.21 Circuit-Interrupting Devices

#### (A) Circuit Breakers.

##### (1) Location.

(a) Circuit breakers installed indoors shall be mounted either in metal-enclosed units or fire-resistant cell-mounted units, or they shall be permitted to be open-mounted in locations accessible to qualified persons only.

(b) Circuit breakers used to control oil-filled transformers in a vault shall either be located outside the transformer vault or be capable of operation from outside the vault.

(c) Oil circuit breakers shall be arranged or located so that adjacent readily combustible structures or materials are safeguarded in an approved manner.

**(2) Operating Characteristics.** Circuit breakers shall have the following equipment or operating characteristics:

- (1) An accessible mechanical or other identified means for manual tripping, independent of control power
- (2) Be release free (trip free)
- (3) If capable of being opened or closed manually while energized, main contacts that operate independently of the speed of the manual operation
- (4) A mechanical position indicator at the circuit breaker to show the open or closed position of the main contacts
- (5) A means of indicating the open and closed position of the breaker at the point(s) from which they may be operated

**(3) Nameplate.** A circuit breaker shall have a permanent and legible nameplate showing manufacturer's name or trademark, manufacturer's type or identification number, continuous current rating, interrupting rating in megavolt-

amperes (MVA) or amperes, and maximum voltage rating. Modification of a circuit breaker affecting its rating(s) shall be accompanied by an appropriate change of nameplate information.

**(4) Rating.** Circuit breakers shall have the following ratings:

- (1) The continuous current rating of a circuit breaker shall not be less than the maximum continuous current through the circuit breaker.
- (2) The interrupting rating of a circuit breaker shall not be less than the maximum fault current the circuit breaker will be required to interrupt, including contributions from all connected sources of energy.
- (3) The closing rating of a circuit breaker shall not be less than the maximum asymmetrical fault current into which the circuit breaker can be closed.
- (4) The momentary rating of a circuit breaker shall not be less than the maximum asymmetrical fault current at the point of installation.
- (5) The rated maximum voltage of a circuit breaker shall not be less than the maximum circuit voltage.

**(B) Power Fuses and Fuseholders.**

**(1) Use.** Where fuses are used to protect conductors and equipment, a fuse shall be placed in each ungrounded conductor. Two power fuses shall be permitted to be used in parallel to protect the same load if both fuses have identical ratings and both fuses are installed in an identified common mounting with electrical connections that divide the current equally. Power fuses of the vented type shall not be used indoors, underground, or in metal enclosures unless identified for the use.

**(2) Interrupting Rating.** The interrupting rating of power fuses shall not be less than the maximum fault current the fuse is required to interrupt, including contributions from all connected sources of energy.

**(3) Voltage Rating.** The maximum voltage rating of power fuses shall not be less than the maximum circuit voltage. Fuses having a minimum recommended operating voltage shall not be applied below this voltage.

**(4) Identification of Fuse Mountings and Fuse Units.** Fuse mountings and fuse units shall have permanent and legible nameplates showing the manufacturer's type or designation, continuous current rating, interrupting current rating, and maximum voltage rating.

**(5) Fuses.** Fuses that expel flame in opening the circuit shall be designed or arranged so that they function properly without hazard to persons or property.

**(6) Fuseholders.** Fuseholders shall be designed or installed so that they are de-energized while a fuse is being replaced.

*Exception: Fuses and fuseholders designed to permit fuse replacement by qualified persons using equipment designed for the purpose without de-energizing the fuseholder shall be permitted.*

**(7) High-Voltage Fuses.** Metal-enclosed switchgear and substations that utilize high-voltage fuses shall be provided with a gang-operated disconnecting switch. Isolation of the fuses from the circuit shall be provided by either connecting a switch between the source and the fuses or providing roll-out switch and fuse-type construction. The switch shall be of the load-interrupter type, unless mechanically or electrically interlocked with a load-interrupting device arranged to reduce the load to the interrupting capability of the switch.

*Exception: More than one switch shall be permitted as the disconnecting means for one set of fuses where the switches are installed to provide connection to more than one set of supply conductors. The switches shall be mechanically or electrically interlocked to permit access to the fuses only when all switches are open. A conspicuous sign shall be placed at the fuses identifying the presence of more than one source.*

**(C) Distribution Cutouts and Fuse Links — Expulsion Type.**

**(1) Installation.** Cutouts shall be located so that they may be readily and safely operated and re-fused, and so that the exhaust of the fuses does not endanger persons. Distribution cutouts shall not be used indoors, underground, or in metal enclosures.

**(2) Operation.** Where fused cutouts are not suitable to interrupt the circuit manually while carrying full load, an approved means shall be installed to interrupt the entire load. Unless the fused cutouts are interlocked with the switch to prevent opening of the cutouts under load, a conspicuous sign shall be placed at such cutouts identifying that they shall not be operated under load.

**(3) Interrupting Rating.** The interrupting rating of distribution cutouts shall not be less than the maximum fault current the cutout is required to interrupt, including contributions from all connected sources of energy.

**(4) Voltage Rating.** The maximum voltage rating of cutouts shall not be less than the maximum circuit voltage.

**(5) Identification.** Distribution cutouts shall have on their body, door, or fuse tube a permanent and legible nameplate

or identification showing the manufacturer's type or designation, continuous current rating, maximum voltage rating, and interrupting rating.

**(6) Fuse Links.** Fuse links shall have a permanent and legible identification showing continuous current rating and type.

**(7) Structure Mounted Outdoors.** The height of cutouts mounted outdoors on structures shall provide safe clearance between lowest energized parts (open or closed position) and standing surfaces, in accordance with 110.34(E).

**(D) Oil-Filled Cutouts.**

**(1) Continuous Current Rating.** The continuous current rating of oil-filled cutouts shall not be less than the maximum continuous current through the cutout.

**(2) Interrupting Rating.** The interrupting rating of oil-filled cutouts shall not be less than the maximum fault current the oil-filled cutout is required to interrupt, including contributions from all connected sources of energy.

**(3) Voltage Rating.** The maximum voltage rating of oil-filled cutouts shall not be less than the maximum circuit voltage.

**(4) Fault Closing Rating.** Oil-filled cutouts shall have a fault closing rating not less than the maximum asymmetrical fault current that can occur at the cutout location, unless suitable interlocks or operating procedures preclude the possibility of closing into a fault.

**(5) Identification.** Oil-filled cutouts shall have a permanent and legible nameplate showing the rated continuous current, rated maximum voltage, and rated interrupting current.

**(6) Fuse Links.** Fuse links shall have a permanent and legible identification showing the rated continuous current.

**(7) Location.** Cutouts shall be located so that they are readily and safely accessible for re-fusing, with the top of the cutout not over 1.5 m (5 ft) above the floor or platform.

**(8) Enclosure.** Suitable barriers or enclosures shall be provided to prevent contact with nonshielded cables or energized parts of oil-filled cutouts.

**(E) Load Interrupters.** Load-interrupter switches shall be permitted if suitable fuses or circuit breakers are used in conjunction with these devices to interrupt fault currents. Where these devices are used in combination, they shall be coordinated electrically so that they will safely withstand the

effects of closing, carrying, or interrupting all possible currents up to the assigned maximum short-circuit rating.

Where more than one switch is installed with interconnected load terminals to provide for alternate connection to different supply conductors, each switch shall be provided with a conspicuous sign identifying this hazard.

**(1) Continuous Current Rating.** The continuous current rating of interrupter switches shall equal or exceed the maximum continuous current at the point of installation.

**(2) Voltage Rating.** The maximum voltage rating of interrupter switches shall equal or exceed the maximum circuit voltage.

**(3) Identification.** Interrupter switches shall have a permanent and legible nameplate including the following information: manufacturer's type or designation, continuous current rating, interrupting current rating, fault closing rating, maximum voltage rating.

**(4) Switching of Conductors.** The switching mechanism shall be arranged to be operated from a location where the operator is not exposed to energized parts and shall be arranged to open all ungrounded conductors of the circuit simultaneously with one operation. Switches shall be arranged to be locked in the open position. Metal-enclosed switches shall be operable from outside the enclosure.

**(5) Stored Energy for Opening.** The stored-energy operator shall be permitted to be left in the uncharged position after the switch has been closed if a single movement of the operating handle charges the operator and opens the switch.

**(6) Supply Terminals.** The supply terminals of fused interrupter switches shall be installed at the top of the switch enclosure, or, if the terminals are located elsewhere, the equipment shall have barriers installed so as to prevent persons from accidentally contacting energized parts or dropping tools or fuses into energized parts.

See Exhibits 490.1 and 490.2 for an example of a fused interrupter switch and the fuseholder components.

## 490.22 Isolating Means

Means shall be provided to completely isolate an item of equipment from all ungrounded conductors. The use of isolating switches shall not be required where there are other ways of de-energizing the equipment for inspection and repairs, such as draw-out-type metal-enclosed switchgear units and removable truck panels.

**EXHIBIT 490.1** Group-operated interrupter-switch and power-fuse combination rated at 13.8 kV, 600 amperes continuous and interrupting, 40,000 amperes momentary, 40,000 amperes fault closing. (Courtesy of S&C Electric Co.)

**EXHIBIT 490.2** Components of the indoor solid-material (SM) power fuseholder (boric-acid arc-extinguishing type) with a 14.4 kV, 400E-ampere maximum, 40,000-ampere rms asymmetrical interrupting rating. Shown here are the spring and cable assembly, refill unit, holder, and snuffler. (Courtesy of S&C Electric Co.)

Isolating switches not interlocked with an approved circuit-interrupting device shall be provided with a sign warning against opening them under load.

A fuseholder and fuse, designed for the purpose, shall be permitted as an isolating switch.

#### 490.23 Voltage Regulators

Proper switching sequence for regulators shall be ensured by use of one of the following:

- (1) Mechanically sequenced regulator bypass switch(es)
- (2) Mechanical interlocks
- (3) Switching procedure prominently displayed at the switching location

#### 490.24 Minimum Space Separation

In field-fabricated installations, the minimum air separation between bare live conductors and between such conductors and adjacent grounded surfaces shall not be less than the values given in Table 490.24. These values shall not apply to interior portions or exterior terminals of equipment designed, manufactured, and tested in accordance with accepted national standards.

### III. Equipment — Metal-Enclosed Power Switchgear and Industrial Control Assemblies

#### 490.30 General

This part covers assemblies of metal-enclosed power switchgear and industrial control, including but not limited to switches, interrupting devices and their control, metering, protection and regulating equipment, where an integral part of the assembly, with associated interconnections and supporting structures. This part also includes metal-enclosed power switchgear assemblies that form a part of unit substations, power centers, or similar equipment.

For the control and protection of feeders, Exhibit 490.3 illustrates a typical example of metal-enclosed switchgear. This industrial unit substation includes a high-voltage disconnect switch, transformer, and low-voltage switchgear with a fully functioning ground-fault relay protection system.

Indicator instruments, such as voltmeters, ammeters, wattmeters, and protective relays, may be mounted on the panel doors as desired. This switchgear affords a high degree of safety because all live parts are metal-enclosed, and interlocks are provided for safe operation.

#### 490.31 Arrangement of Devices in Assemblies

Arrangement of devices in assemblies shall be such that individual components can safely perform their intended

TABLE 490.24 Minimum Clearance of Live Parts

Nominal Voltage Rating (kV)	Minimum Clearance of Live Parts									
	Impulse Withstand, Basic Impulse Level B.I.L. (kV)		Phase-to-Phase				Phase-to-Ground

46	—	200	—	—	460	18	—	—	335	13
	—	250	—	—	535	21	—	—	435	17
69	—	250	—	—	535	21	—	—	435	17
	—	350	—	—	790	31	—	—	635	25
115	—	550	—	—	1350	53	—	—	1070	42
138	—	550	—	—	1350	53	—	—	1070	42
	—	650	—	—	1605	63	—	—	1270	50
161	—	650	—	—	1605	63	—	—	1270	50
	—	750	—	—	1830	72	—	—	1475	58
230	—	750	—	—	1830	72	—	—	1475	58
	—	900	—	—	2265	89	—	—	1805	71
	—	1050	—	—	2670	105	—	—	2110	83

Note: The values given are the minimum clearance for rigid parts and bare conductors under favorable service conditions. They shall be increased for conductor movement or under unfavorable service conditions or wherever space limitations permit. The selection of the associated impulse withstand voltage for a particular system voltage is determined by the characteristics of the surge protective equipment.

**EXHIBIT 490.3** An assembly of metal-enclosed switchgear transformer and low-voltage equipment. (Courtesy of Schneider Electric)

function without adversely affecting the safe operation of other components in the assembly.

### 490.32 Guarding of High-Voltage Energized Parts Within a Compartment

Where access for other than visual inspection is required to a compartment that contains energized high-voltage parts, barriers shall be provided to prevent accidental contact by persons, tools, or other equipment with energized parts. Exposed live parts shall only be permitted in compartments accessible to qualified persons. Fuses and fuseholders designed to enable future replacement without de-energizing the fuseholder shall only be permitted for use by qualified persons.

An example of a high-voltage pad-mounted transformer and enclosure that may contain primary and secondary switches or circuit breakers is shown in Exhibit 490.4.

**EXHIBIT 490.4** Open view of a tamperproof pad-mount transformer for loop-feed application with load-break elbow connectors. The high-voltage compartment on the left has bayonet fusing and a load-break transformer on/off switch, which are both hot-stick operated. (Courtesy of Schneider Electric)

### 490.33 Guarding of Energized Parts Operating at 600 Volts, Nominal, or Less Within Compartments

Energized bare parts mounted on doors shall be guarded where the door must be opened for maintenance of equipment or removal of draw-out equipment.

### 490.34 Clearance for Cable Conductors Entering Enclosure

The unobstructed space opposite terminals or opposite raceways or cables entering a switchgear or control assembly shall be adequate for the type of conductor and method of termination.

### 490.35 Accessibility of Energized Parts

**(A) High-Voltage Equipment.** Doors that would provide unqualified persons access to high-voltage energized parts shall be locked.

**(B) Control Equipment.** Where operating at 600 volts, nominal, or less, control equipment, relays, motors, and the like shall not be installed in compartments with exposed high-voltage energized parts or high-voltage wiring, unless either of the following conditions is met:

- (1) The access means is interlocked with the high-voltage switch or disconnecting means to prevent the access means from being opened or removed.
- (2) The high-voltage switch or disconnecting means is in the isolating position.

**(C) High-Voltage Instruments or Control Transformers and Space Heaters.** High-voltage instrument or control transformers and space heaters shall be permitted to be installed in the high-voltage compartment without access restrictions beyond those that apply to the high-voltage compartment generally.

### 490.36 Grounding

Frames of switchgear and control assemblies shall be connected to an equipment grounding conductor or, where permitted, the grounded conductor.

### 490.37 Grounding of Devices

The metal cases or frames, or both, such as instruments, relays, meters, and instrument and control transformers, located in or on switchgear or control, shall be connected to an equipment grounding conductor or, where permitted, the grounded conductor.

### 490.38 Door Stops and Cover Plates

External hinged doors or covers shall be provided with stops to hold them in the open position. Cover plates intended to be removed for inspection of energized parts or wiring shall be equipped with lifting handles and shall not exceed 1.1 m<sup>2</sup> (12 ft<sup>2</sup>) in area or 27 kg (60 lb) in weight, unless they are hinged and bolted or locked.

### 490.39 Gas Discharge from Interrupting Devices

Gas discharged during operating of interrupting devices shall be directed so as not to endanger personnel.

### 490.40 Visual Inspection Windows

Windows intended for visual inspection of disconnecting switches or other devices shall be of suitable transparent material.

### 490.41 Location of Industrial Control Equipment

Routinely operated industrial control equipment shall meet the requirements of (A) unless infrequently operated, as covered in 490.41(B).

**(A) Control and Instrument Transfer Switch Handles or Push Buttons.** Control and instrument transfer switch handles or push buttons shall be in a readily accessible location at an elevation of not over 2.0 m (6 ft 7 in.).

*Exception: Operating handles requiring more than 23 kg (50 lb) of force shall be located no higher than 1.7 m (66 in.) in either the open or closed position.*

**(B) Infrequently Operated Devices.** Where operating handles for such devices as draw-out fuses, fused potential or control transformers and their primary disconnects, and bus transfer and isolating switches are only operated infrequently, the handles shall be permitted to be located where they are safely operable and serviceable from a portable platform.

#### 490.42 Interlocks — Interrupter Switches

Interrupter switches equipped with stored energy mechanisms shall have mechanical interlocks to prevent access to the switch compartment unless the stored energy mechanism is in the discharged or blocked position.

#### 490.43 Stored Energy for Opening

The stored energy operator shall be permitted to be left in the uncharged position after the switch has been closed if a single movement of the operating handle charges the operator and opens the switch.

#### 490.44 Fused Interrupter Switches

**(A) Supply Terminals.** The supply terminals of fused interrupter switches shall be installed at the top of the switch enclosure or, if the terminals are located elsewhere, the equipment shall have barriers installed so as to prevent persons from accidentally contacting energized parts or dropping tools or fuses into energized parts.

**(B) Backfeed.** Where fuses can be energized by backfeed, a sign shall be placed on the enclosure door identifying this hazard.

**(C) Switching Mechanism.** The switching mechanism shall be arranged to be operated from a location outside the enclosure where the operator is not exposed to energized parts and shall be arranged to open all ungrounded conductors of the circuit simultaneously with one operation. Switches shall be capable of being locked in the open position. The provisions for locking shall remain in place with or without the lock installed.

#### 490.45 Circuit Breakers — Interlocks

**(A) Circuit Breakers.** Circuit breakers equipped with stored energy mechanisms shall be designed to prevent the release of the stored energy unless the mechanism has been fully charged.

**(B) Mechanical Interlocks.** Mechanical interlocks shall be provided in the housing to prevent the complete withdrawal of the circuit breaker from the housing when the stored energy mechanism is in the fully charged position, unless a suitable device is provided to block the closing function of the circuit breaker before complete withdrawal.

#### 490.46 Circuit Breaker Locking

Circuit breakers shall be capable of being locked in the open position or, if they are installed in a drawout mechanism, that mechanism shall be capable of being locked in such a position that the mechanism cannot be moved into the connected position. In either case, the provision for locking shall remain in place with or without the lock.

#### 490.47 Metal-Enclosed and Metal-Clad Service Equipment

Metal-enclosed and metal-clad switchgear installed as high-voltage service equipment shall include a ground bus for the connection of service cable shields and to facilitate the attachment of safety grounds for personnel protection. This bus shall be extended into the compartment where the service conductors are terminated.

Section 490.47 requires metal-enclosed and metal-clad switchgear to include a ground bus for the service cable shields. It also provides a location for the connection of safety grounds for personnel protection during servicing of the equipment. The bus must extend to the compartment where the service conductor terminals are located.

### IV. Mobile and Portable Equipment

#### 490.51 General

**(A) Covered.** The provisions of this part shall apply to installations and use of high-voltage power distribution and utilization equipment that is portable, mobile, or both, such as substations and switch houses mounted on skids, trailers, or cars; mobile shovels; draglines; cranes; hoists; drills; dredges; compressors; pumps; conveyors; underground excavators; and the like.

**(B) Other Requirements.** The requirements of this part shall be additional to, or amendatory of, those prescribed in Articles 100 through 725 of this *Code*. Special attention shall be paid to Article 250.

**(C) Protection.** Adequate enclosures, guarding, or both, shall be provided to protect portable and mobile equipment from physical damage.

**(D) Disconnecting Means.** Disconnecting means shall be installed for mobile and portable high-voltage equipment according to the requirements of Part VIII of Article 230 and shall disconnect all ungrounded conductors.

#### 490.52 Overcurrent Protection

Motors driving single or multiple dc generators supplying a system operating on a cyclic load basis do not require overload protection, provided that the thermal rating of the ac

drive motor cannot be exceeded under any operating condition. The branch-circuit protective device(s) shall provide short-circuit and locked-rotor protection and shall be permitted to be external to the equipment.

#### 490.53 Enclosures

All energized switching and control parts shall be enclosed in grounded metal cabinets or enclosures. These cabinets or enclosures shall be marked “DANGER — HIGH VOLTAGE — KEEP OUT” and shall be locked so that only authorized and qualified persons can enter. Circuit breakers and protective equipment shall have the operating means projecting through the metal cabinet or enclosure so these units can be reset without opening locked doors. With doors closed, reasonable safe access for normal operation of these units shall be provided.

#### 490.54 Collector Rings

The collector ring assemblies on revolving-type machines (shovels, draglines, etc.) shall be guarded to prevent accidental contact with energized parts by personnel on or off the machine.

#### 490.55 Power Cable Connections to Mobile Machines

A metallic enclosure shall be provided on the mobile machine for enclosing the terminals of the power cable. The enclosure shall include terminal connections to the machine frame for the equipment grounding conductor. Ungrounded conductors shall be attached to insulators or be terminated in approved high-voltage cable couplers (which include equipment grounding conductor connectors) of proper voltage and ampere rating. The method of cable termination used shall prevent any strain or pull on the cable from stressing the electrical connections. The enclosure shall have provision for locking so that only authorized and qualified persons may open it and shall be marked as follows:

DANGER — HIGH VOLTAGE — KEEP OUT.

#### 490.56 High-Voltage Portable Cable for Main Power Supply

Flexible high-voltage cable supplying power to portable or mobile equipment shall comply with Article 250 and Article 400, Part III.

### V. Electrode-Type Boilers

#### 490.70 General

The provisions of this part shall apply to boilers operating over 600 volts, nominal, in which heat is generated by the passage of current between electrodes through the liquid being heated.

#### 490.71 Electrical Supply System

Electrode-type boilers shall be supplied only from a 3-phase, 4-wire solidly grounded wye system, or from isolating transformers arranged to provide such a system. Control circuit voltages shall not exceed 150 volts, shall be supplied from a grounded system, and shall have the controls in the ungrounded conductor.

#### 490.72 Branch-Circuit Requirements

**(A) Rating.** Each boiler shall be supplied from an individual branch circuit rated not less than 100 percent of the total load.

**(B) Common-Trip Fault-Interrupting Device.** The circuit shall be protected by a 3-phase, common-trip fault-interrupting device, which shall be permitted to automatically reclose the circuit upon removal of an overload condition but shall not reclose after a fault condition.

**(C) Phase-Fault Protection.** Phase-fault protection shall be provided in each phase, consisting of a separate phase-overcurrent relay connected to a separate current transformer in the phase.

**(D) Ground Current Detection.** Means shall be provided for detection of the sum of the neutral conductor and equipment grounding conductor currents and shall trip the circuit-interrupting device if the sum of those currents exceeds the greater of 5 amperes or 7½ percent of the boiler full-load current for 10 seconds or exceeds an instantaneous value of 25 percent of the boiler full-load current.

**(E) Grounded Neutral Conductor.** The grounded neutral conductor shall be as follows:

- (1) Connected to the pressure vessel containing the electrodes
- (2) Insulated for not less than 600 volts
- (3) Have not less than the ampacity of the largest ungrounded branch-circuit conductor
- (4) Installed with the ungrounded conductors in the same raceway, cable, or cable tray, or, where installed as open conductors, in close proximity to the ungrounded conductors
- (5) Not used for any other circuit

#### 490.73 Pressure and Temperature Limit Control

Each boiler shall be equipped with a means to limit the maximum temperature, pressure, or both, by directly or indirectly interrupting all current flow through the electrodes. Such means shall be in addition to the temperature, pressure, or both, regulating systems and pressure relief or safety valves.

**490.74 Bonding**

All exposed non–current-carrying metal parts of the boiler and associated exposed metal structures or equipment shall be bonded to the pressure vessel or to the neutral conductor

to which the vessel is connected in accordance with 250.102, except the ampacity of the bonding jumper shall not be less than the ampacity of the neutral conductor.

Informational Note: Text that is followed by a reference in brackets has been extracted from NFPA 497-2008, *Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*, and NFPA 499-2008, *Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installation in Chemical Process Areas*. Only editorial changes were made to the extracted text to make it consistent with this *Code*.

### 500.1 Scope — Articles 500 Through 504

Articles 500 through 504 cover the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Divisions 1 and 2; Class II, Divisions 1 and 2; and Class III, Divisions 1 and 2 locations where fire or explosion hazards may exist due to flammable gases, flammable liquid-produced vapors, combustible liquid-produced vapors, combustible dusts, or ignitable fibers/flyings.

Hazardous locations are sometimes referred to as classified locations. Article 500 of the *NEC* uses the term *Hazardous (Classified) Locations* as its title. Some codes or standards use one term, some use the other, and some use both. It has been debated that because an area had been classified, all areas described in this *Code* as “hazardous locations” should be described as “classified locations” or “classified areas.” Some prefer not to use the term *hazardous*, and others prefer not to use the term *classified*. As used in NFPA codes and standards and the *NEC*, the terms are interchangeable.

Hazardous (classified) locations, if properly treated, are not necessarily any more dangerous to work in than other areas or locations. The term *hazardous* is maintained in the *NEC* because it provides, by its very name, a degree of warning.

Articles 500 through 506 cover the requirements for electrical installations in locations classified as hazardous locations due to the materials handled, processed, or stored in those locations. Some of the most common materials encountered in hazardous locations are flammable and combustible liquids. A flammable liquid is one that has a flash point below 100°F, while a combustible liquid has a flash point at or above 100°F. A flammable or combustible liquid

must be at its flash point before an explosion can occur. No. 1-D diesel fuel oil and kerosene, with flash points higher than 100°F, are considered combustible liquids and do not emit flammable vapors unless heated above their flash points.

Article 500 is limited to locations classified as Class I, Class II, or Class III, Division 1 or 2. Class I, Class II, and Class III are further addressed in Articles 501, 502, and 503, respectively. Article 505 contains the requirements for using the Class I, Zone 0, 1, and 2 method of area classification, and Article 506 contains the requirements using the classification of Zones 20, 21, and 22. Article 504 for intrinsically safe systems is used for both methods (Division and Zone) of area classification.

The *Code* does not classify areas where the manufacture, transportation, storage, or use of explosive materials, such as ammunition, dynamite, and blasting powder, occurs. Areas where such materials are present are not considered hazardous locations in accordance with Article 500. However, many organizations responsible for the safety of such areas require equipment and wiring methods suitable for hazardous locations as part of many safety precautions, even though the equipment and wiring have not been investigated for such locations. The logic is that hazardous location equipment and wiring methods are safer than ordinary location equipment and wiring methods. Further information on these locations can be found in NFPA 495, *Explosive Materials Code*.

For information on hazardous locations in general, including background on the classification of areas, equipment protection systems, ignition sources, static electricity and lightning, and requirements that apply outside the United States, see *Electrical Installations in Hazardous Locations*, by Peter J. Schram and Mark W. Earley. This book is available from NFPA.

Informational Note No. 1: The unique hazards associated with explosives, pyrotechnics, and blasting agents are not addressed in this article.

Informational Note No. 2: For the requirements for electrical and electronic equipment and wiring for all voltages in Zone 0, Zone 1, and Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors or flammable liquids, refer to Article 505.

Informational Note No. 3: For the requirements for electrical and electronic equipment and wiring for all voltages in Zone 20, Zone 21, and Zone 22 hazardous (classified) locations where fire or explosion hazards may exist due to combustible dusts or ignitable fibers/flyings, refer to Article 506.

## 500.2 Definitions

For purposes of Articles 500 through 504 and Articles 510 through 516, the following definitions apply.

**Associated Nonincendive Field Wiring Apparatus.** Apparatus in which the circuits are not necessarily nonincendive themselves but that affect the energy in nonincendive field wiring circuits and are relied upon to maintain nonincendive energy levels. Associated nonincendive field wiring apparatus may be either of the following:

- (1) Electrical apparatus that has an alternative type of protection for use in the appropriate hazardous (classified) location
- (2) Electrical apparatus not so protected that shall not be used in a hazardous (classified) location

Informational Note: Associated nonincendive field wiring apparatus has designated associated nonincendive field wiring apparatus connections for nonincendive field wiring apparatus and may also have connections for other electrical apparatus.

**Combustible Dust.** Any finely divided solid material that is 420 microns (0.017 in.) or smaller in diameter (material passing a U.S. No. 40 Standard Sieve) and presents a fire or explosion hazard when dispersed and ignited in air. [499, 2008]

**Combustible Gas Detection System.** A protection technique utilizing stationary gas detectors in industrial establishments.

**Control Drawing.** A drawing or other document provided by the manufacturer of the intrinsically safe or associated apparatus, or of the nonincendive field wiring apparatus or associated nonincendive field wiring apparatus, that details the allowed interconnections between the intrinsically safe and associated apparatus or between the nonincendive field wiring apparatus or associated nonincendive field wiring apparatus.

**Dust-Ignitionproof.** Equipment enclosed in a manner that excludes dusts and does not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure.

Informational Note: For further information on dust-ignitionproof enclosures, see Type 9 enclosure in ANSI/NEMA 250-1991, *Enclosures for Electrical Equipment*, and ANSI/UL 1203-1994, *Explosionproof and Dust-Ignitionproof Electrical Equipment for Hazardous (Classified) Locations*.

**Dusttight.** Enclosures constructed so that dust will not enter under specified test conditions.

Informational Note: See ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations*.

**Electrical and Electronic Equipment.** Materials, fittings, devices, appliances, and the like that are part of, or in connection with, an electrical installation.

Informational Note: Portable or transportable equipment having self-contained power supplies, such as battery-operated equipment, could potentially become an ignition source in hazardous (classified) locations. See ISA-RP12.12.03-2002, *Recommended Practice for Portable Electronic Products Suitable for Use in Class I and II, Division 2, Zone 2 and Class III, Division 1 and 2 Hazardous (Classified) Locations*.

**Explosionproof Equipment.** Equipment enclosed in a case that is capable of withstanding an explosion of a specified gas or vapor that may occur within it and of preventing the ignition of a specified gas or vapor surrounding the enclosure by sparks, flashes, or explosion of the gas or vapor within, and that operates at such an external temperature that a surrounding flammable atmosphere will not be ignited thereby.

Informational Note: For further information, see ANSI/UL 1203-1994, *Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations*.

**Hermetically Sealed.** Equipment sealed against the entrance of an external atmosphere where the seal is made by fusion, for example, soldering, brazing, welding, or the fusion of glass to metal.

Informational Note: For further information, see ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Division 1 and 2 Hazardous (Classified) Locations*.

**Nonincendive Circuit.** A circuit, other than field wiring, in which any arc or thermal effect produced under intended operating conditions of the equipment is not capable, under specified test conditions, of igniting the flammable gas–air, vapor–air, or dust–air mixture.

A nonincendive circuit employs a protection technique that prevents electrical circuits from causing a fire or explosion in a hazardous location. Section 500.7(F) permits this protection technique only for Division 2 areas of Class I or Class II locations and for Division 1 or 2 areas of Class III locations. Nonincendive circuits and equipment are tested or evaluated essentially in the same way that intrinsically safe circuits and equipment are tested and evaluated, except that abnormal conditions are not considered. Because of its definition, a nonincendive circuit is a low-energy circuit.

Informational Note: Conditions are described in ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations*.

**Nonincendive Component.** A component having contacts for making or breaking an incendive circuit and the contacting mechanism is constructed so that the component is inca-

pable of igniting the specified flammable gas–air or vapor–air mixture. The housing of a nonincendive component is not intended to exclude the flammable atmosphere or contain an explosion.

Informational Note: For further information, see ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations*.

**Nonincendive Equipment.** Equipment having electrical/electronic circuitry that is incapable, under normal operating conditions, of causing ignition of a specified flammable gas–air, vapor–air, or dust–air mixture due to arcing or thermal means.

Informational Note: For further information, see ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations*.

**Nonincendive Field Wiring.** Wiring that enters or leaves an equipment enclosure and, under normal operating conditions of the equipment, is not capable, due to arcing or thermal effects, of igniting the flammable gas–air, vapor–air, or dust–air mixture. Normal operation includes opening, shorting, or grounding the field wiring.

Although nonincendive circuits and equipment may have been evaluated and listed as nonincendive, field wiring is not generally evaluated by a testing laboratory. Field wiring meeting this definition requires limitations of energy on the wiring under conditions such as opening, shorting, or grounding. For example, stored energy in the form of mutual inductance or capacitance could be released during an opening, shorting, or grounding of nonincendive field wiring, thus defeating the purpose of this protection technique. Further information regarding nonincendive protection techniques is found in the 500.2 definitions of *nonincendive circuit*, *nonincendive component*, *nonincendive equipment*, and *nonincendive field wiring apparatus*.

**Nonincendive Field Wiring Apparatus.** Apparatus intended to be connected to nonincendive field wiring.

Informational Note: For further information, see ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations*.

**Oil Immersion.** Electrical equipment immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

Informational Note: For further information, see ANSI/UL 698-1995, *Industrial Control Equipment for Use in Hazardous (Classified) Locations*.

**Purged and Pressurized.** The process of (1) purging, supplying an enclosure with a protective gas at a sufficient flow and positive pressure to reduce the concentration of any flammable gas or vapor initially present to an acceptable level; and (2) pressurization, supplying an enclosure with a protective gas with or without continuous flow at sufficient pressure to prevent the entrance of a flammable gas or vapor, a combustible dust, or an ignitable fiber.

Informational Note: For further information, see ANSI/NFPA 496-2008, *Purged and Pressurized Enclosures for Electrical Equipment*.

**Unclassified Locations.** Locations determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; Zone 20; Zone 21; Zone 22; or any combination thereof.

### 500.3 Other Articles

Except as modified in Articles 500 through 504, all other applicable rules contained in this *Code* shall apply to electrical equipment and wiring installed in hazardous (classified) locations.

The first four chapters of the *Code* cover general installation requirements for all electrical equipment and wiring (see 90.3). Materials and equipment installed in a hazardous location must also be suitable for environmental conditions such as rain, snow, ice, altitude, and heat; protected from any deteriorating effects on conductors and equipment; and have an interrupting rating sufficient for the nominal circuit voltage and available fault current, just to name a few.

Requirements in Articles 500 through 506 amend or modify the general installation rules to ensure the integrity of electrical installations and to minimize the possibility of electrical equipment being an ignition source in the volatile or potentially volatile environments covered in these articles. Examples of how the hazardous location articles of Chapter 5 modify the general requirements are found in the wiring method requirements of 501.10, 502.10, and 503.10. These sections of the *Code* limit the wiring methods that can be used in Class I, Class II, and Class III locations in order to provide the highest degree of protection against physical damage. The installation of any wiring methods allowed by Articles 500 through 506 must be in accordance with the Chapter 3 article that governs that particular wiring method and with any modifications in Articles 500 through 517.

### 500.4 General

**(A) Documentation.** All areas designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to de-

sign, install, inspect, maintain, or operate electrical equipment at the location.

One type of documentation consists of area classification drawings. Once the hazardous area has been classified and the hazardous area diagram has been developed, the materials and installation methods of the *NEC* are used to construct the electrical system in the classified area. This approach provides the necessary information for installers, service personnel, and authorities having jurisdiction to ensure that electrical equipment installed or maintained in classified areas is of the proper type. See the informational note to 505.4(A) for a list of documents containing examples of classification drawings.

**(B) Reference Standards.** Important information relating to topics covered in Chapter 5 may be found in other publications.

Informational Note No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with the standards of the National Fire Protection Association (NFPA), the American Petroleum Institute (API), and the International Society of Automation (ISA), that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

Informational Note No. 2: For further information on the classification of locations, see NFPA 30-2008, *Flammable and Combustible Liquids Code*; NFPA 32-2007, *Standard for Drycleaning Plants*; NFPA 33-2011, *Standard for Spray Application Using Flammable or Combustible Materials*; NFPA 34-2011, *Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids*; NFPA 35-2005, *Standard for the Manufacture of Organic Coatings*; NFPA 36-2009, *Standard for Solvent Extraction Plants*; NFPA 45-2011, *Standard on Fire Protection for Laboratories Using Chemicals*; NFPA 55-2010, *Compressed Gases and Cryogenic Fluids Code*; NFPA 58-2011, *Liquefied Petroleum Gas Code*; NFPA 59-2008, *Utility LP-Gas Plant Code*; NFPA 497-2008, *Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*; NFPA 499-2008, *Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*; NFPA 820-2008, *Standard for Fire Protection in Wastewater Treatment and Collection Facilities*; ANSI/API RP500-1997, *Recommended Practice for Classification of Locations of Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2*; ISA-12.10-1988, *Area Classification in Hazardous (Classified) Dust Locations*.

Informational Note No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see NFPA 77-2007, *Recommended Practice on Static Electricity*; NFPA 780-2011, *Standard for the Installation of Lightning Protection Systems*; and API RP 2003-1998, *Protection Against Ignitions Arising Out of Static Lightning and Stray Currents*.

Informational Note No. 4: For further information on ventilation, see NFPA 30-2008, *Flammable and Combustible Liquids Code*; and API RP 500-1997, *Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2*.

Informational Note No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil- and gas-producing platforms, see ANSI/API RP 14F-1999, *Recommended Practice for Design and Installation of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class I, Division 1 and Division 2 Locations*.

The standards referenced in Articles 500 through 517 are essential for proper application of those articles. In addition to the documents listed in the informational notes to 500.4(B), the following NFPA codes, standards, and recommended practices include valuable information on hazardous locations in specific applications, occupancies, or industries:

NFPA 30A, *Code for Motor Fuel Dispensing Facilities and Repair Garages*

NFPA 51, *Standard for the Design and Installation of Oxygen–Fuel Gas Systems for Welding, Cutting, and Allied Processes*

NFPA 51A, *Standard for Acetylene Cylinder Charging Plants*

NFPA 52, *Vehicular Gaseous Fuel Systems Code*

NFPA 54, *Natural Fuel Gas Code*

NFPA 59A, *Standard for the Production, Storage, and Handling of Liquefied Natural Gas (LNG)*

NFPA 61, *Standard for the Prevention of Fires and Dust Explosions in Agricultural and Food Processing Facilities*

NFPA 85, *Boiler and Combustion Systems Hazards Code*

NFPA 88A, *Standard for Parking Structures*

NFPA 99, *Standard for Health Care Facilities*

NFPA 407, *Standard for Aircraft Fuel Servicing*

NFPA 409, *Standard on Aircraft Hangars*

NFPA 495, *Explosive Materials Code*

NFPA 496, *Standard for Purged and Pressurized Enclosures for Electrical Equipment*

NFPA 654, *Standard for the Prevention of Fire and Dust Explosions from the Manufacturing, Processing, and Handling of Combustible Particulate Solids*

NFPA 655, *Standard for Prevention of Sulfur Fires and Explosions*

## 500.5 Classifications of Locations

**(A) Classifications of Locations.** Locations shall be classified depending on the properties of the flammable gas, flammable liquid-produced vapor, combustible-liquid produced vapors, combustible dusts, or fibers/flyings that may be present, and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified. Each room, section, or area shall be considered individually in determining its classification.

Informational Note: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in a reduced level of classification or in an unclassified location and, thus, to reduce the amount of special equipment required.

Rooms and areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation may be classified as “unclassified” locations.

The *NEC* does not classify specific Class I, II, and III locations. NFPA technical committees and the American Petroleum Institute (API), among other organizations with experience and expertise in working with flammable liquids, gases, vapors, dusts, fibers and flyings inherent to a process or present under abnormal conditions of operation, determine the parameters, distances, and degrees of hazard associated with classified locations. Some of this information has been extracted from other NFPA and API documents and is included in Articles 511 through 517 of the *Code*.

In some facilities, an expert or team of experts, which may include a process engineer, a mechanical engineer, a safety engineer, and operations personnel, will use the information developed in those NFPA standards and apply it to their specific equipment and process and, depending on the materials and physical equipment and locations (for example, possible leaks at flanges, machinery seals), decide on the area classification, and produce the hazardous area diagram. See the commentary for 500.4(A). Common sense and good judgment must prevail in classifying an area that is likely to become hazardous and in determining those portions of the premises to be classified Division 1 or Division 2.

Informational Note: For further information regarding classification and ventilation of areas involving ammonia, see ANSI/ASHRAE 15-1994, *Safety Code for Mechanical Refrigeration*, and ANSI/CGA G2.1-1989, *Safety Requirements for the Storage and Handling of Anhydrous Ammonia*.

Because pyrophoric materials ignite spontaneously upon contact with air, the use of electrical equipment suitable for

hazardous locations will not prevent ignition of these materials. Instead, the process containment system should be designed to prevent contact between pyrophoric material and air.

**(B) Class I Locations.** Class I locations are those in which flammable gases, flammable liquid–produced vapors, or combustible liquid–produced vapors are or may be present in the air in quantities sufficient to produce explosive or ignitable mixtures. Class I locations shall include those specified in 500.5(B)(1) and (B)(2).

Class I locations, which involve the handling of a volatile flammable liquid or a flammable gas, are common in many cities and towns. Gas stations and propane filling stations are two examples of this type of location. The public interacts daily with these Class I locations without incident. Exhibit 500.1 shows another type of a Class I location, which is a station that dispenses compressed natural gas (CNG). Each of these types of dispensing facilities is covered under Article 514.

**EXHIBIT 500.1** A CNG filling station, which is a Class I location.

**(1) Class I, Division 1.** A Class I, Division 1 location is a location

- (1) In which ignitable concentrations of flammable gases, flammable liquid–produced vapors, or combustible liquid–produced vapors can exist under normal operating conditions, or
- (2) In which ignitable concentrations of such flammable gases, flammable liquid–produced vapors, or combusti-

ble liquids above their flash points may exist frequently because of repair or maintenance operations or because of leakage, or

- (3) In which breakdown or faulty operation of equipment or processes might release ignitable concentrations of flammable gases, flammable liquid–produced vapors, or combustible liquid–produced vapors and might also cause simultaneous failure of electrical equipment in such a way as to directly cause the electrical equipment to become a source of ignition.

Informational Note No. 1: This classification usually includes the following locations:

- (1) Where volatile flammable liquids or liquefied flammable gases are transferred from one container to another
- (2) Interiors of spray booths and areas in the vicinity of spraying and painting operations where volatile flammable solvents are used
- (3) Locations containing open tanks or vats of volatile flammable liquids
- (4) Drying rooms or compartments for the evaporation of flammable solvents
- (5) Locations containing fat- and oil-extraction equipment using volatile flammable solvents
- (6) Portions of cleaning and dyeing plants where flammable liquids are used
- (7) Gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape
- (8) Inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids
- (9) The interiors of refrigerators and freezers in which volatile flammable materials are stored in open, lightly stoppered, or easily ruptured containers
- (10) All other locations where ignitable concentrations of flammable vapors or gases are likely to occur in the course of normal operations

Informational Note No. 2: In some Division 1 locations, ignitable concentrations of flammable gases or vapors may be present continuously or for long periods of time. Examples include the following:

- (1) The inside of inadequately vented enclosures containing instruments normally venting flammable gases or vapors to the interior of the enclosure
- (2) The inside of vented tanks containing volatile flammable liquids
- (3) The area between the inner and outer roof sections of a floating roof tank containing volatile flammable fluids
- (4) Inadequately ventilated areas within spraying or coating operations using volatile flammable fluids
- (5) The interior of an exhaust duct that is used to vent ignitable concentrations of gases or vapors

Experience has demonstrated the prudence of avoiding the installation of instrumentation or other electrical equipment in these particular areas altogether or where it cannot be avoided because it is essential to the process and other

locations are not feasible [see 500.5(A), Informational Note] using electrical equipment or instrumentation approved for the specific application or consisting of intrinsically safe systems as described in Article 504.

Informational Note No. 2 describes locations that are defined in 500.5(B)(1) as Class I, Division 1 locations. These locations are Class I, Zone 0 locations in accordance with 505.5(B)(1).

**(2) Class I, Division 2.** A Class I, Division 2 location is a location

- (1) In which volatile flammable gases, flammable liquid-produced vapors, or combustible liquid-produced vapors are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems or in case of abnormal operation of equipment, or
- (2) In which ignitable concentrations of flammable gases, flammable liquid-produced vapors, or combustible liquid-produced vapors are normally prevented by positive mechanical ventilation and which might become hazardous through failure or abnormal operation of the ventilating equipment, or
- (3) That is adjacent to a Class I, Division 1 location, and to which ignitable concentrations of flammable gases, flammable liquid-produced vapors, or combustible liquid-produced vapors above their flash points might occasionally be communicated unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

Informational Note No. 1: This classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used but that, in the judgment of the authority having jurisdiction, would become hazardous only in case of an accident or of some unusual operating condition. The quantity of flammable material that might escape in case of accident, the adequacy of ventilating equipment, the total area involved, and the record of the industry or business with respect to explosions or fires are all factors that merit consideration in determining the classification and extent of each location.

Informational Note No. 2: Piping without valves, checks, meters, and similar devices would not ordinarily introduce a hazardous condition even though used for flammable liquids or gases. Depending on factors such as the quantity and size of the containers and ventilation, locations used for the storage of flammable liquids or liquefied or compressed gases in sealed containers may be considered either hazardous (classified) or unclassified locations. See NFPA 30-2008, *Flammable and Combustible Liquids Code*, and NFPA 58-2011, *Liquefied Petroleum Gas Code*.

**(C) Class II Locations.** Class II locations are those that are hazardous because of the presence of combustible dust. Class II locations shall include those specified in 500.5(C)(1) and (C)(2).

**(1) Class II, Division 1.** A Class II, Division 1 location is a location

- (1) In which combustible dust is in the air under normal operating conditions in quantities sufficient to produce explosive or ignitable mixtures, or
- (2) Where mechanical failure or abnormal operation of machinery or equipment might cause such explosive or ignitable mixtures to be produced, and might also provide a source of ignition through simultaneous failure of electrical equipment, through operation of protection devices, or from other causes, or
- (3) In which Group E combustible dusts may be present in quantities sufficient to be hazardous.

Informational Note: Dusts containing magnesium or aluminum are particularly hazardous, and the use of extreme precaution is necessary to avoid ignition and explosion.

Section 500.5(C)(1) clarifies the conditions that would require a space to be classified as Class II, Division 1. Group E dusts are particularly hazardous. Therefore, where these dusts may be present in sufficient quantity to be hazardous, under any condition the area will only be classified as a Division 1 location. There are no Class II, Division 2, Group E locations. The classification will be either Division 1 or non-hazardous.

**(2) Class II, Division 2.** A Class II, Division 2 location is a location

- (1) In which combustible dust due to abnormal operations may be present in the air in quantities sufficient to produce explosive or ignitable mixtures; or
- (2) Where combustible dust accumulations are present but are normally insufficient to interfere with the normal operation of electrical equipment or other apparatus, but could as a result of infrequent malfunctioning of handling or processing equipment become suspended in the air; or
- (3) In which combustible dust accumulations on, in, or in the vicinity of the electrical equipment could be sufficient to interfere with the safe dissipation of heat from electrical equipment, or could be ignitable by abnormal operation or failure of electrical equipment.

Informational Note No. 1: The quantity of combustible dust that may be present and the adequacy of dust removal systems are factors that merit consideration in determining the classification and may result in an unclassified area.

Informational Note No. 2: Where products such as seed are handled in a manner that produces low quantities of dust, the amount of dust deposited may not warrant classification.

**(D) Class III Locations.** Class III locations are those that are hazardous because of the presence of easily ignitable fibers or where materials producing combustible flyings are handled, manufactured, or used, but in which such fibers/flyings are not likely to be in suspension in the air in quantities sufficient to produce ignitable mixtures. Class III locations shall include those specified in 500.5(D)(1) and (D)(2).

**(1) Class III, Division 1.** A Class III, Division 1 location is a location in which easily ignitable fibers/flyings are handled, manufactured, or used.

Informational Note No. 1: Such locations usually include some parts of rayon, cotton, and other textile mills; combustible fibers/flyings manufacturing and processing plants; cotton gins and cotton-seed mills; flax-processing plants; clothing manufacturing plants; woodworking plants; and establishments and industries involving similar hazardous processes or conditions.

Informational Note No. 2: Easily ignitable fibers/flyings include rayon, cotton (including cotton linters and cotton waste), sisal or henequen, istle, jute, hemp, tow, cocoa fiber, oakum, baled waste kapok, Spanish moss, excelsior, and other materials of similar nature.

**(2) Class III, Division 2.** A Class III, Division 2 location is a location in which easily ignitable fibers/flyings are stored or handled other than in the process of manufacture.

Sections 500.5(B), (C), and (D) describe three classes of hazardous locations based on the type of material involved (gases and vapors — Class I, dusts — Class II, or fibers/flyings — Class III). Within each class are varying degrees of hazard, so each class is subdivided into two divisions that are based on the likelihood the material will be present. The requirements for Division 1 of each class are more stringent than those for Division 2.

If different types of material — such as a flammable gas and a combustible dust — exist in a process or location, the area must be classified as both a Class I and a Class II location, and protection must be provided for both hazards. Equipment that is identified for a Class I location may not be suitable for a Class II location and vice versa. Exhibit 500.2 shows a coal-handling operation classified as both a Class I (methane) and Class II (coal dust) location.

## 500.6 Material Groups

For purposes of testing, approval, and area classification, various air mixtures (not oxygen-enriched) shall be grouped in accordance with 500.6(A) and (B).

**EXHIBIT 500.2** A coal-handling operation classified as both a Class I and a Class II location. (Courtesy of Noel Williams)

Oxygen enrichment can drastically change the explosion characteristics of materials. It lowers minimum ignition energies, increases explosion pressures, and can reduce the maximum experimental safe gap, rendering both intrinsically safe and explosionproof equipment unsafe unless the equipment has been tested for the conditions involved.

*Exception: Equipment identified for a specific gas, vapor, or dust.*

Informational Note: This grouping is based on the characteristics of the materials. Facilities are available for testing and identifying equipment for use in the various atmospheric groups.

Determining the proper group classification for flammable gases, flammable liquid-produced vapors, or combustible liquid-produced vapors involves evaluating explosion pressures and maximum safe clearances between parts of a clamped joint under several conditions and comparison of the values obtained with those obtained for classified materials under the same test conditions. Although some work has been done on the classification of flammable materials on the basis of chemical structure, this method is not sufficiently refined or accurate enough to ensure proper classification of all flammable materials.

**(A) Class I Group Classifications.** Class I groups shall be according to 500.6(A)(1) through (A)(4).

Informational Note No. 1: Informational Note Nos. 2 and 3 apply to 500.6(A).

Informational Note No. 2: The explosion characteristics of air mixtures of gases or vapors vary with the specific material involved. For Class I locations, Groups A, B, C, and D,

the classification involves determinations of maximum explosion pressure and maximum safe clearance between parts of a clamped joint in an enclosure. It is necessary, therefore, that equipment be identified not only for class but also for the specific group of the gas or vapor that will be present.

Informational Note No. 3: Certain chemical atmospheres may have characteristics that require safeguards beyond those required for any of the Class I groups. Carbon disulfide is one of these chemicals because of its low ignition temperature (90°C) and the small joint clearance permitted to arrest its flame.

**(1) Group A.** Acetylene. [497:3.3.5.1.1]

**(2) Group B.** Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.45 mm or a minimum igniting current ratio (MIC ratio) less than or equal to 0.40. [497:3.3.5.1.2]

Informational Note: A typical Class I, Group B material is hydrogen.

*Exception No. 1: Group D equipment shall be permitted to be used for atmospheres containing butadiene, provided all conduit runs into explosionproof equipment are provided with explosionproof seals installed within 450 mm (18 in.) of the enclosure.*

*Exception No. 2: Group C equipment shall be permitted to be used for atmospheres containing allyl glycidyl ether, n-butyl glycidyl ether, ethylene oxide, propylene oxide, and acrolein, provided all conduit runs into explosionproof equipment are provided with explosionproof seals installed within 450 mm (18 in.) of the enclosure.*

The specific materials identified in Exception No. 1 and Exception No. 2 produce high pressures due to pressure piling in unsealed conduits. If all conduits are sealed, the volume of air and gas between the sealing fittings and the arcing contacts is limited, thereby minimizing the pressure that can build within the enclosure and the raceway.

**(3) Group C.** Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.45 mm and less than or equal to 0.75 mm, or a minimum igniting current ratio (MIC ratio) greater than 0.40 and less than or equal to 0.80. [497:3.3.5.1.3]

Informational Note: A typical Class I, Group C material is ethylene.

**(4) Group D.** Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.75 mm or a minimum igniting current ratio (MIC ratio) greater than 0.80. [497:3.3.5.1.4]

Informational Note No. 1: A typical Class I, Group D material is propane.

Informational Note No. 2: For classification of areas involving ammonia atmospheres, see ANSI/ASHRAE 15-1994, *Safety Code for Mechanical Refrigeration*, and ANSI/CGA G2.1-1989, *Safety Requirements for the Storage and Handling of Anhydrous Ammonia*.

Flammable gases, flammable liquid–produced vapors, and combustible liquid–produced vapors are separated into four Class I groups — A, B, C, and D (or three Class I zone groups — IIC, IIB, and IIA; see 505.6) depending on their properties. By grouping explosive mixtures that have similar igniting current ratios and maximum safe clearances between parts of a joint in an enclosure, equipment can be designed for the entire group rather than an individual chemical. The *Code* requirements for Class I locations do not vary for different kinds of gas or vapor contained in a group, except for the specific Group B chemicals in Exception No. 1 and Exception No. 2 to 500.6(A)(2). This method makes it easier to properly select equipment designed for use in the particular group involved.

Underwriters Laboratories Inc. and FM Approvals list electrical equipment suitable for use in all groups of Class I locations. Further information is available from the *UL Hazardous Locations Equipment Directory* and the *FM Approval Guide*. Other testing laboratories may also list equipment for hazardous locations for use in the United States. The acceptance of the listing agency is the responsibility of the authority having jurisdiction.

Several testing laboratories outside the United States also provide listing, approval, or certification of equipment for use in hazardous locations. However, they may not be testing and investigating the equipment for use in hazardous locations, as defined in Article 500. Some international laboratories certify equipment for installation where the classification is according to the IEC classification scheme covered in Articles 505 and 506. In addition, equipment that was certified to an IEC standard for use in another country may require modification in order to be used in a U.S. electrical system. Such modifications may compromise safety.

Commentary Table 500.1 is an alphabetical listing of selected combustible materials with their group classification and relevant physical properties. All the materials included in this table have been evaluated for the purpose of designating the appropriate gas group.

<sup>a</sup>Type is used to designate if the material is a gas, flammable liquid, or combustible liquid. (See 4.2.6 and 4.2.7 of NFPA 497.)

<sup>b</sup>Vapor pressure reflected in units of mm Hg at 25°C (77°F) unless stated otherwise.

<sup>c</sup>Class I, Zone Groups are based on 1996 IEC TR3 60079-20, *Electrical apparatus for explosive gas atmospheres — Part 20: Data for flammable gases and vapours, relating to the use of electrical apparatus*, which contains additional data on MESG and group classifications.

<sup>d</sup>Material has been classified by test.

<sup>e</sup>Where all conduit runs into explosionproof equipment are provided with explosionproof seals installed within 450 mm (18 in.) of the enclosure, equipment for the group classification shown in parentheses is permitted.

<sup>f</sup>For classification of areas involving ammonia, see ASHRAE 15, *Safety Code for Mechanical Refrigeration*, and ANSI/CGA G2.1, *Safety Requirements for the Storage and Handling of Anhydrous Ammonia*.

<sup>g</sup>Commercial grades of aliphatic hydrocarbon solvents are mixtures of several isomers of the same chemical formula (or molecular weight). The autoignition temperatures of the individual isomers are significantly different. The electrical equipment should be suitable for the AIT of the solvent mixture. (See A.4.4.2 of NFPA 497.)

<sup>h</sup>Certain chemicals have characteristics that require safeguards beyond those required for any of the above groups. Carbon disulfide is one of these chemicals because of its low autoignition temperature and the small joint clearance necessary to arrest its flame propagation.

<sup>i</sup>Petroleum naphtha is a saturated hydrocarbon mixture whose boiling range is 20°C to 135°C (68°F to 275°F). It is also known as benzine, ligroin, petroleum ether, and naphtha.

<sup>j</sup>Fuel and process gas mixtures found by test not to present hazards similar to those of hydrogen may be grouped based on the test results.

<sup>k</sup>Liquid type and flash point vary due to regional blending differences.

Source: NFPA 497-2008, *Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*, Table 4.4.2

This information is used to properly select electrical equipment for use in Class I locations. The combustible materials in Commentary Table 500.1 are classified into four Class I, division groups — A, B, C, and D — or three Class I, zone groups — IC, IIB, and IIA — depending on their properties. Commentary Table 500.1 is extracted from NFPA 497-2008, *Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*. NFPA 497 defines several of the relevant physical property terms contained in the column headings of this table.

**(B) Class II Group Classifications.** Class II groups shall be in accordance with 500.6(B)(1) through (B)(3).

**(1) Group E.** Atmospheres containing combustible metal dusts, including aluminum, magnesium, and their commercial alloys, or other combustible dusts whose particle size, abrasiveness, and conductivity present similar hazards in the use of electrical equipment. [499:3.3.4.1]

Informational Note: Certain metal dusts may have characteristics that require safeguards beyond those required for atmospheres containing the dusts of aluminum, magnesium, and their commercial alloys. For example, zirconium, thorium, and uranium dusts have extremely low ignition temperatures [as low as 20°C (68°F)] and minimum ignition energies lower than any material classified in any of the Class I or Class II groups.

**(2) Group F.** Atmospheres containing combustible carbonaceous dusts that have more than 8 percent total entrapped volatiles (see ASTM D 3175-02, *Standard Test Method for*

*Volatile Matter in the Analysis Sample for Coal and Coke*, for coal and coke dusts) or that have been sensitized by other materials so that they present an explosion hazard. Coal, carbon black, charcoal, and coke dusts are examples of carbonaceous dusts. [499:3.3.4.2]

Informational Note: Testing of specific dust samples, following established ASTM testing procedures, is a method used to identify the combustibility of a specific dust and the need to classify those locations containing that material as Group F.

**(3) Group G.** Atmospheres containing combustible dusts not included in Group E or F, including flour, grain, wood, plastic, and chemicals.

Informational Note No. 1: For additional information on group classification of Class II materials, see NFPA 499-2008, *Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*.

Informational Note No. 2: The explosion characteristics of air mixtures of dust vary with the materials involved. For Class II locations, Groups E, F, and G, the classification involves the tightness of the joints of assembly and shaft openings to prevent the entrance of dust in the dust-ignitionproof enclosure, the blanketing effect of layers of dust on the equipment that may cause overheating, and the ignition temperature of the dust. It is necessary, therefore, that equipment be identified not only for the class but also for the specific group of dust that will be present.

Informational Note No. 3: Certain dusts may require additional precautions due to chemical phenomena that can result in the generation of ignitable gases. See ANSI C2-2007, *National Electrical Safety Code*, Section 127A, Coal Handling Areas.

Section 500.6(B) separates combustible dusts into three Class II groups — E, F, and G — depending on their properties. Publication NMAB-353-4, *Classifications of Dusts Relative to Electrical Equipment in Class II Hazardous Locations*, published in 1982 by the Committee on Evaluation of Industrial Hazards, National Materials Advisory Board, Commission on Engineering and Technical Systems, National Research Council, and National Academy of Sciences, includes a description of the test methods used to determine the ignition temperatures and electrical resistivity of combustible dusts. The publication is available from the National Technical Information Service (NTIS), Springfield, VA 22151.

As in Class I locations, equipment must be approved not only for the class but also for the specific group, and high installation standards are essential initially and for subsequent additions or alterations.

Commentary Table 500.2 is an alphabetical listing of selected combustible materials with their group designation and relevant physical properties.

**COMMENTARY TABLE 500.2** Selected Combustible Materials

## Notes:

1. Normally, the minimum ignition temperature of a layer of a specific dust is lower than the minimum ignition temperature of a cloud of that dust. Since this is not universally true, the lower of the two minimum ignition temperatures is listed. If no symbol appears in the "Code" column, then the layer ignition temperature is shown. "CL" means the cloud ignition temperature is shown. "NL" means that no layer ignition temperature is available, and the cloud ignition temperature is shown. "M" signifies that the dust layer melts before it ignites; the cloud ignition temperature is shown. "S" signifies that the dust layer sublimates before it ignites; the cloud ignition temperature is shown.

2. Certain metal dusts may have characteristics that require safeguards beyond those required for atmospheres containing the dusts of aluminum, magnesium, and their commercial alloys. For example, zirconium and thorium dusts may ignite spontaneously in air, especially at elevated temperatures.

3. Due to the impurities found in coal, its ignition temperatures vary regionally and ignition temperatures are not available for all regions in which coal is mined.

Source: NFPA 499-2008, *Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*, Table 4.5.2.

All the materials included in this table have been evaluated for the purpose of designating the dust as a Group E, F, or G material. This information is used to properly select electrical equipment for use in Class II locations. Commentary Table 500.2 is extracted from NFPA 499-2008, *Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*. NFPA 499 defines several of the relevant physical property terms contained in the column headings of this table.

### 500.7 Protection Techniques

Section 500.7(A) through (L) shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations.

**(A) Explosionproof Equipment.** This protection technique shall be permitted for equipment in Class I, Division 1 or 2 locations.

**(B) Dust Ignitionproof.** This protection technique shall be permitted for equipment in Class II, Division 1 or 2 locations.

**(C) Dusttight.** This protection technique shall be permitted for equipment in Class II, Division 2 or Class III, Division 1 or 2 locations.

**(D) Purged and Pressurized.** This protection technique shall be permitted for equipment in any hazardous (classified) location for which it is identified.

NFPA 496, *Standard for Purged and Pressurized Enclosures for Electrical Equipment*, covers purged and pressurized enclosures for electrical equipment in Class I and Class II hazardous locations. In Class I locations, purged and pressurized enclosures are used to eliminate or reduce, within the enclosure, a Class I hazardous location classification. In Class II locations, pressurized enclosures prevent the entrance of dusts into an enclosure. Purged and pressurized enclosures make it possible for equipment that is not otherwise acceptable for Class I and Class II locations to be used in these locations.

Purging is the process of supplying an enclosure with a protective gas at a sufficient flow and positive pressure to reduce the initial concentration of any flammable gases, flammable liquid-produced vapors, or combustible liquid-produced vapors to an acceptable level.

Pressurization is the process of supplying an enclosure with a protective gas, with or without continuous flow, at sufficient pressure to prevent the entrance of a flammable

gas or vapor, a combustible dust, or an ignitable fiber. A combustible dust inside an enclosure cannot be reduced to a safe level by purging with a flow of protective gas in the same manner as with gases or vapors. Supplying a flow of air into the enclosure could stir up the dust that has accumulated inside the enclosure and therein create a dust cloud that could explode if an ignition source occurs. The enclosure must be opened, and the dust must be removed. Positive pressure then prevents dust from re-entering the clean enclosure. The types of pressurizing are as follows:

1. Type X reduces the classification within a protected enclosure from Division 1 or Zone 1 to unclassified.
2. Type Y reduces the classification within a protected enclosure from Division 1 to Division 2 or from Zone 1 to Zone 2.
3. Type Z reduces the classification within a protected enclosure from Division 2 or Zone 2 to unclassified.

Exhibit 500.3 shows a panel that uses the Type X purge and pressurization technique. The pressure regulator/filter on the side of the enclosure is for the purge gas supply connection. The integrated controller and vent are mounted on the side and bottom of the panel, respectively.

Field-installed devices and equipment, such as push-button controls and pilot lights, are permitted in purged and pressurized enclosures provided the conductor terminals are within the purged or pressurized atmosphere. Section 17.11

**EXHIBIT 500.3** A panel using Type X pressurization. (Courtesy of Pepperl and Fuchs, Inc.)

of NFPA 30-2008, *Flammable and Combustible Liquids Code*, and Section 4.6 of ANSI/API RP 500-1998, *Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2*, provide guidelines on what is considered adequate ventilation.

**(E) Intrinsic Safety.** This protection technique shall be permitted for equipment in Class I, Division 1 or 2; or Class II, Division 1 or 2; or Class III, Division 1 or 2 locations. The provisions of Articles 501 through 503 and Articles 510 through 516 shall not be considered applicable to such installations, except as required by Article 504, and installation of intrinsically safe apparatus and wiring shall be in accordance with the requirements of Article 504.

**(F) Nonincendive Circuit.** This protection technique shall be permitted for equipment in Class I, Division 2; Class II, Division 2; or Class III, Division 1 or 2 locations.

**(G) Nonincendive Equipment.** This protection technique shall be permitted for equipment in Class I, Division 2; Class II, Division 2; or Class III, Division 1 or 2 locations.

**(H) Nonincendive Component.** This protection technique shall be permitted for equipment in Class I, Division 2; Class II, Division 2; or Class III, Division 1 or 2 locations.

**(I) Oil Immersion.** This protection technique shall be permitted for current-interrupting contacts in Class I, Division 2 locations as described in 501.115(B)(1)(2).

**(J) Hermetically Sealed.** This protection technique shall be permitted for equipment in Class I, Division 2; Class II, Division 2; or Class III, Division 1 or 2 locations.

**(K) Combustible Gas Detection System.** A combustible gas detection system shall be permitted as a means of protection in industrial establishments with restricted public access and where the conditions of maintenance and supervision ensure that only qualified persons service the installation. Where such a system is installed, equipment specified in 500.7(K)(1), (K)(2), or (K)(3) shall be permitted.

The type of detection equipment, its listing, installation location(s), alarm and shutdown criteria, and calibration frequency shall be documented when combustible gas detectors are used as a protection technique.

Informational Note No. 1: For further information, see ANSI/ISA-60079-29-1, *Explosive Atmospheres - Part 29-1: Gas detectors - Performance requirements of detectors for flammable gases*, and ANSI/UL 2075, *Gas and Vapor Detectors and Sensors*.

Informational Note No. 2: For further information, see ANSI/API RP 500, *Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 or Division 2*.

Informational Note No. 3: For further information, see ANSI/ISA-60079-29-2, *Explosive Atmospheres - Part 29-2: Gas detectors - Selection, installation, use and maintenance of detectors for flammable gases and oxygen*.

Informational Note No. 4: For further information, see ISA-TR12.13.03, *Guide for Combustible Gas Detection as a Method of Protection*.

Although other installed equipment is permitted to be suitable for a division lower than the hazardous location, the combustible gas detection system is required to be listed for the initial hazardous area classification and to detect the specific gas or vapor.

**(1) Inadequate Ventilation.** In a Class I, Division 1 location that is so classified due to inadequate ventilation, electrical equipment suitable for Class I, Division 2 locations shall be permitted. Combustible gas detection equipment shall be listed for Class I, Division 1, for the appropriate material group, and for the detection of the specific gas or vapor to be encountered.

**(2) Interior of a Building.** In a building located in, or with an opening into, a Class I, Division 2 location where the interior does not contain a source of flammable gas or vapor, electrical equipment for unclassified locations shall be permitted. Combustible gas detection equipment shall be listed for Class I, Division 1 or Class I, Division 2, for the appropriate material group, and for the detection of the specific gas or vapor to be encountered.

**(3) Interior of a Control Panel.** In the interior of a control panel containing instrumentation utilizing or measuring flammable liquids, gases, or vapors, electrical equipment suitable for Class I, Division 2 locations shall be permitted. Combustible gas detection equipment shall be listed for Class I, Division 1, for the appropriate material group, and for the detection of the specific gas or vapor to be encountered.

**(L) Other Protection Techniques.** Other protection techniques used in equipment identified for use in hazardous (classified) locations.

Other protection techniques of listed equipment can be unique or a combination of protection techniques, such as listed attachment plugs for use in hazardous locations and listed battery-operated two-way radios, cell phones, flashlights, and lanterns.

### 500.8 Equipment

Articles 500 through 504 require equipment construction and installation that ensure safe performance under conditions of proper use and maintenance.

Informational Note No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to installation and maintenance.

Informational Note No. 2: Since there is no consistent relationship between explosion properties and ignition temperature, the two are independent requirements.

Informational Note No. 3: Low ambient conditions require special consideration. Explosionproof or dust-ignitionproof equipment may not be suitable for use at temperatures lower than  $-25^{\circ}\text{C}$  ( $-13^{\circ}\text{F}$ ) unless they are identified for low-temperature service. However, at low ambient temperatures, flammable concentrations of vapors may not exist in a location classified as Class I, Division 1 at normal ambient temperature.

At low ambient temperatures, such as those encountered in the Arctic, explosion pressures increase, the strengths of materials change, and the explosion pressure in explosionproof equipment may increase beyond the safe operating strength of the material. In addition, some sealing materials for sealing fittings may become brittle. However, the extent of the hazardous location may also change under low ambient conditions. The material may be used in a location where the temperature range is so low that no vapors are produced based on the flash point of the material involved.

**(A) Suitability.** Suitability of identified equipment shall be determined by one of the following:

- (1) Equipment listing or labeling
- (2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
- (3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment.

Informational Note: Additional documentation for equipment may include certificates demonstrating compliance with applicable equipment standards, indicating special conditions of use, and other pertinent information. Guidelines for certificates may be found in ANSI/ISA 12.00.02, *Certificate Standard for AEx Equipment for Hazardous (Classified) Locations*.

**(B) Approval for Class and Properties.**

(1) Equipment shall be identified not only for the class of location but also for the explosive, combustible, or ignitable properties of the specific gas, vapor, dust, or fibers/flyings that will be present. In addition, Class I equipment shall not have any exposed surface that operates at a temperature in excess of the ignition temperature of the specific gas or

vapor. Class II equipment shall not have an external temperature higher than that specified in 500.8(D)(2). Class III equipment shall not exceed the maximum surface temperatures specified in 503.5.

Informational Note: Luminaires and other heat-producing apparatus, switches, circuit breakers, and plugs and receptacles are potential sources of ignition and are investigated for suitability in classified locations. Such types of equipment, as well as cable terminations for entry into explosionproof enclosures, are available as listed for Class I, Division 2 locations. Fixed wiring, however, may utilize wiring methods that are not evaluated with respect to classified locations. Wiring products such as cable, raceways, boxes, and fittings, therefore, are not marked as being suitable for Class I, Division 2 locations. Also see 500.8(C)(6)(a).

(2) Equipment that has been identified for a Division 1 location shall be permitted in a Division 2 location of the same class, group, and temperature class and shall comply with (a) or (b) as applicable.

(a) Intrinsically safe apparatus having a control drawing requiring the installation of associated apparatus for a Division 1 installation shall be permitted to be installed in a Division 2 location if the same associated apparatus is used for the Division 2 installation.

(b) Equipment that is required to be explosionproof shall incorporate seals in accordance with 501.15(A) or (D) when the wiring methods of 501.10(B) are employed.

(3) Where specifically permitted in Articles 501 through 503, general-purpose equipment or equipment in general-purpose enclosures shall be permitted to be installed in Division 2 locations if the equipment does not constitute a source of ignition under normal operating conditions.

(4) Equipment that depends on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the equipment shall be identified for a Class I, Division 2 location even if installed in an unclassified location. Equipment installed in a Class I, Division 1 location shall be identified for the Class I, Division 1 location.

Informational Note: Equipment used for flow measurement is an example of equipment having a single compression seal, diaphragm, or tube.

(5) Unless otherwise specified, normal operating conditions for motors shall be assumed to be rated full-load steady conditions.

Normal condition for a motor is considered to be at steady full-load. Locked-rotor or other abnormal motor conditions,

such as single phasing, are not considered when evaluating motor-operating temperatures (internal and external) in Class I, Division 2 locations. However, such abnormal load conditions must be considered when evaluating the external temperatures of explosionproof motors for Class I, Division 1 locations and dust-ignitionproof motors for Class II, Division 1 locations. Awareness of the increase in temperature in some variable-speed motors is important when they are operated at a lower speed and are dependent on the fan for cooling.

(6) Where flammable gases, flammable liquid-produced vapors, combustible liquid-produced vapors, or combustible dusts are or may be present at the same time, the simultaneous presence of both shall be considered when determining the safe operating temperature of the electrical equipment.

Informational Note: The characteristics of various atmospheric mixtures of gases, vapors, and dusts depend on the specific material involved.

Examples of where special consideration may be necessary due to the simultaneous presence of flammable liquid and dust are at a coal-handling facility, where there is methane gas and coal dust, and in an automotive paint spray shop, where flammable paint and powdered metal flecks are sprayed.

(C) **Marking.** Equipment shall be marked to show the environment for which it has been evaluated. Unless otherwise specified or allowed in (C)(6), the marking shall include the information specified in (C)(1) through (C)(5).

(1) **Class.** The marking shall specify the class(es) for which the equipment is suitable.

(2) **Division.** The marking shall specify the division if the equipment is suitable for Division 2 only. Equipment suitable for Division 1 shall be permitted to omit the division marking.

Informational Note: Equipment not marked to indicate a division, or marked “Division 1” or “Div. 1,” is suitable for both Division 1 and 2 locations; see 500.8(B)(2). Equipment marked “Division 2” or “Div. 2” is suitable for Division 2 locations only.

(3) **Material Classification Group.** The marking shall specify the applicable material classification group(s) in accordance with 500.6.

*Exception: Fixed luminaires marked for use only in Class I, Division 2 or Class II, Division 2 locations shall not be required to indicate the group.*

(4) **Equipment Temperature.** The marking shall specify the temperature class or operating temperature at a 40°C ambient temperature, or at the higher ambient temperature if the equipment is rated and marked for an ambient temperature of greater than 40°C. The temperature class, if provided, shall be indicated using the temperature class (T Codes) shown in Table 500.8(C). Equipment for Class I and Class II shall be marked with the maximum safe operating temperature, as determined by simultaneous exposure to the combinations of Class I and Class II conditions.

The marked operating temperature or temperature range is normally referenced to a 40°C ambient. Unless the equipment is provided with thermally actuated sensors that limit the temperature to that marked on the equipment, operation in ambient temperatures higher than 40°C increases the operating temperature of the equipment. Many explosionproof and dust-ignitionproof motors are equipped with thermal protectors. In a similar manner, operation in ambient temperatures lower than 40°C usually reduces the operating temperature.

TABLE 500.8(C) Classification of Maximum Surface Temperature

Maximum Temperature		Temperature Class (T Code)
°C	°F	
450	842	T1
300	572	T2
280	536	T2A
260	500	T2B
230	446	T2C
215	419	T2D
200	392	T3
180	356	T3A
165	329	T3B
160	320	T3C
135	275	T4
120	248	T4A
100	212	T5
85	185	T6

*Exception: Equipment of the non-heat-producing type, such as junction boxes, conduit, and fittings, and equipment of the heat-producing type having a maximum temperature not more than 100°C shall not be required to have a marked operating temperature or temperature class.*

Informational Note: More than one marked temperature class or operating temperature, for gases and vapors, dusts, and different ambient temperatures, may appear.

**(5) Ambient Temperature Range.** Electrical equipment designed for use in the ambient temperature range between  $-25^{\circ}\text{C}$  to  $+40^{\circ}\text{C}$  shall require no ambient temperature marking. For equipment rated for a temperature range other than  $-25^{\circ}\text{C}$  to  $+40^{\circ}\text{C}$ , the marking shall specify the special range of ambient temperatures in degrees Celsius. The marking shall include either the symbol “Ta” or “Tamb.”

Informational Note: As an example, such a marking might be “ $-30^{\circ}\text{C} \leq \text{Ta} \leq +40^{\circ}\text{C}$ .”

**(6) Special Allowances.**

(a) *General-Purpose Equipment.* Fixed general-purpose equipment in Class I locations, other than fixed luminaires, that is acceptable for use in Class I, Division 2 locations shall not be required to be marked with the class, division, group, temperature class, or ambient temperature range.

Marking is not required for fixed general-purpose equipment, such as a squirrel-cage induction motor without brushes, switching mechanisms, or similar arc-producing devices. See 501.125(B) and its associated commentary for more information on motors in Class I, Division 2 locations.

(b) *Dusttight Equipment.* Fixed dusttight equipment, other than fixed luminaires, that is acceptable for use in Class II, Division 2 and Class III locations shall not be required to be marked with the class, division, group, temperature class, or ambient temperature range.

(c) *Associated Apparatus.* Associated intrinsically safe apparatus and associated nonincendive field wiring apparatus that are not protected by an alternative type of protection shall not be marked with the class, division, group, or temperature class. Associated intrinsically safe apparatus and associated nonincendive field wiring apparatus shall be marked with the class, division, and group of the apparatus to which it is to be connected.

(d) *Simple Apparatus.* “Simple apparatus” as defined in Article 504, shall not be required to be marked with class, division, group, temperature class, or ambient temperature range.

**(D) Temperature.**

**(1) Class I Temperature.** The temperature marking specified in 500.8(C) shall not exceed the ignition temperature of the specific gas or vapor to be encountered.

Informational Note: For information regarding ignition temperatures of gases and vapors, see NFPA 497-2008, *Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors, and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*.

The ignition temperature of a solid, liquid, or gaseous substance is the minimum temperature required to initiate or cause self-sustained combustion independent of the heating or heated element. The flash point is the minimum temperature at which a liquid gives off enough vapor to form an ignitable mixture with air. The ignition temperature and the flash point are unrelated properties, except that the flash point is always lower than the ignition temperature.

**(2) Class II Temperature.** The temperature marking specified in 500.8(C) shall be less than the ignition temperature of the specific dust to be encountered. For organic dusts that may dehydrate or carbonize, the temperature marking shall not exceed the lower of either the ignition temperature or  $165^{\circ}\text{C}$  ( $329^{\circ}\text{F}$ ).

Informational Note: See NFPA 499-2008, *Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*, for minimum ignition temperatures of specific dusts.

The ignition temperature for which equipment was approved prior to this requirement shall be assumed to be as shown in Table 500.8(D)(2).

**TABLE 500.8(D)(2) Class II Temperatures**

Class II Group	Equipment Not Subject to Overloading		Equipment (Such as Motors or Power Transformers) That May Be Overloaded			
			Normal Operation		Abnormal Operation	
	$^{\circ}\text{C}$	$^{\circ}\text{F}$	$^{\circ}\text{C}$	$^{\circ}\text{F}$	$^{\circ}\text{C}$	$^{\circ}\text{F}$
E	200	392	200	392	200	392
F	200	392	150	302	200	392
G	165	329	120	248	165	329

**(E) Threading.** The supply connection entry thread form shall be NPT or metric. Conduit and fittings shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosion-proof integrity of the conduit system where applicable. Equipment provided with threaded entries for field wiring connections shall be installed in accordance with 500.8(E)(1) or (E)(2) and with (E)(3).

**(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings.** For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used. All NPT threaded conduit and fittings shall be threaded

with a National (American) Standard Pipe Taper (NPT) thread.

NPT threaded entries into explosionproof equipment shall be made up with at least five threads fully engaged.

*Exception: For listed explosionproof equipment, joints with factory threaded NPT entries shall be made up with at least 4½ threads fully engaged.*

Informational Note No. 1: Thread specifications for male NPT threads are located in ANSI/ASME B1.20.1-1983, *Pipe Threads, General Purpose (Inch)*.

Informational Note No. 2: Female NPT threaded entries use a modified National Standard Pipe Taper (NPT) thread with thread form per ANSI/ASME B1.20.1-1983, *Pipe Threads, General Purpose (Inch)*. See ANSI/UL 1203, *Explosionproof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations*.

**(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings.** For equipment with metric threaded entries, listed conduit fittings or listed cable fittings shall be used. Such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT threaded fittings shall be provided with the equipment and shall be used for connection to conduit or NPT threaded fittings.

Metric threaded entries into explosionproof equipment shall have a class of fit of at least 6g/6H and shall be made up with at least five threads fully engaged for Group C and Group D, and at least eight threads fully engaged for Group A and Group B.

Informational Note: Threading specifications for metric threaded entries are located in ISO 965-1-1998, *ISO general purpose metric screw threads — Tolerances — Part 1: Principles and basic data*, and ISO 965-3-1998, *ISO general purpose metric screw threads — Tolerances — Part 3: Deviations for constructional screw threads*.

To ensure the integrity of the ground-fault current path of the conduit system, all conduit joints must be made up wrenchtight to prevent ignition-capable arcing between the conduit and the coupling, fitting, or enclosure underground-fault conditions. The use of a bonding jumper in lieu of a wrenchtight connection is not permitted.

The information on metric threads has been included to allow for safe electrical and mechanical connections where the enclosure is provided with metric threads and the raceway or cable has NPT threads. Listed conduit, conduit fittings, or cable fittings are required for NPT-threaded equipment and listed adapters and fittings are required for metric-threaded equipment. Similar to the thread engagement requirement for NPT entries, the class of fit and thread engagement requirements are now included for metric entries.

**(3) Unused Openings.** All unused openings shall be closed with listed metal close-up plugs. The plug engagement shall comply with 500.8(E)(1) or (E)(2).

**(F) Optical Fiber Cables.** Where an optical fiber cable contains conductors that are capable of carrying current (composite optical fiber cable), the optical fiber cable shall be installed in accordance with the requirements of Article 500, 501, 502, or 503, as applicable.

The requirements of Articles 500, 501, 502, or 503 apply even if the conductor is grounded.

## 500.9 Specific Occupancies

Articles 510 through 517 cover garages, aircraft hangars, motor fuel dispensing facilities, bulk storage plants, spray application, dipping and coating processes, and health care facilities.

## I. General

### 501.1 Scope

Article 501 covers the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Division 1 and 2 locations where fire or explosion hazards may exist due to flammable gases or vapors or flammable liquids.

**Informational Note:** For the requirements for electrical and electronic equipment and wiring for all voltages in **Zone 0**, Zone 1, or Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors or flammable liquids, refer to Article 505.

The most common Class I locations are those areas involved in the handling or processing of volatile flammable liquids such as gasoline, naphtha, benzene, diethyl ether, and acetone, or flammable gases such as hydrogen, methane, and propane.

Where ignitable concentrations (concentrations within the flammable or explosive limits) of flammable gases, flammable liquid-produced vapors or combustible liquid-produced vapors are present, atmospheres exist that are explosive when ignited by an arc, a spark, or high temperature. NFPA 497, *Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*, includes information on the explosive limits of flammable liquids and gases.

Hermetic sealing of all electrical equipment is impractical because equipment such as motors, conventional switches, and circuit breakers have movable parts that must be operated through the enclosing case; that is, the lever of a switch or the shaft of a motor must have sufficient clearance to operate freely. In addition, in many cases, it is necessary to have access to the inside of enclosures for installation, servicing, or alterations. Therefore, techniques such as explosionproof or intrinsic safety are often employed for electrical equipment.

All electrical equipment that may cause ignition-capable arcs or sparks should be kept out of Class I locations where practicable. If this is not practicable, such apparatus must be identified for the purpose and installed properly. The arc produced at the contacts of listed or labeled intrinsically safe equipment is not ignition-capable because the energy available is insufficient to cause ignition. An arc-induced ignition does not propagate from an explosion-proof enclosure.

It is practically impossible to make threaded conduit joints gastight. The conduit system and apparatus enclosure “breathe” due to temperature changes, and any flammable gases or vapors in the room may slowly enter the conduit or enclosure, creating an explosive mixture. Should an arc occur, an explosion could take place.

When an explosion occurs within the enclosure or conduit system, the burning mixture or hot gases must be sufficiently confined within the system to prevent ignition of any explosive mixture that might be present in the area outside the enclosure or conduit system. An enclosure must be designed with sufficient strength to withstand the maximum pressure generated by an internal explosion in order to prevent rupture and the release of burning or hot gases. The ability to withstand an internal explosion is one criterion by which explosionproof enclosures are evaluated.

During an explosion within an enclosure, gases escape through any paths or openings that exist, but the gases are sufficiently cooled if they are carried out through an opening that is long in proportion to its width; that is, the spiral path of at least five fully engaged threads of a screw-on type junction box cover, as illustrated in Exhibit 501.1, or a wide machined flange on the body of the enclosure and a similar

**EXHIBIT 501.1** Cooling of hot gases as they pass through the threads of a screw-type cover of an explosionproof junction box.

**EXHIBIT 501.2** Cooling of hot gases as they pass across a machine-flanged joint. The clearance between the machined surfaces is kept very small.

machined flange on the cover, as illustrated in Exhibit 501.2.

These machined flanges are ground so that when the cover is seated in place, the clearance between the two surfaces at no point exceeds, for example, 0.0015 in. The clearance between flat surfaces may increase somewhat under explosion conditions because the internal pressures created by the explosion tend to force the surfaces apart, as shown in Exhibit 501.3. The amount of increase in the joint clearance depends on the stiffness of the enclosure parts; the size, strength, and spacing of the bolts; and the explosion pressure. Simply measuring the joint width and clearance when there are no internal pressures does not indicate the actual clearances under the dynamic conditions of an explosion. Explosion tests are usually needed to demonstrate the acceptability of the design.

**EXHIBIT 501.3** Effect of internal explosion (bottom) on cover-to-body joint clearance in an explosionproof enclosure. (Courtesy of Underwriters Laboratories Inc.)

## 501.5 Zone Equipment

Equipment listed and marked in accordance with 505.9(C)(2) for use in **Zone 0**, 1, or 2 locations shall be permitted in Class I, Division 2 locations for the same gas and with a suitable temperature class. Equipment listed and marked in accordance with 505.9(C)(2) for use in **Zone 0** locations shall be permitted in Class I, Division 1 or Division 2 locations for the same gas and with a suitable temperature class.

## II. Wiring

### 501.10 Wiring Methods

Wiring methods shall comply with 501.10(A) or (B).

#### (A) Class I, Division 1.

**(1) General.** In Class I, Division 1 locations, the wiring methods in (a) through (d) shall be permitted.

(a) *Threaded rigid metal conduit or threaded steel intermediate metal conduit.*

Rigid metal conduit and intermediate metal conduit, in accordance with 500.8(E), must be threaded with an NPT standard conduit-cutting die that provides a  $\frac{3}{4}$ -in. taper per foot. For enclosures that are field-threaded, five full threads must be engaged, whereas for listed enclosures with factory-threaded NPT entries,  $4\frac{1}{2}$  threads must be fully engaged. Metric-threaded equipment is permitted by 500.8(E)(2), but must either be identified to indicate that metric threads are provided or be provided with listed adapters to allow the connection of NPT-threaded conduit or fittings to the equipment. Each joint must be made up wrenchtight at couplings

and unions, threaded hubs of junction boxes, device boxes, conduit bodies, and so on.

*Exception: Type PVC conduit and Type RTRC conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. The concrete encasement shall be permitted to be omitted where subject to the provisions of 514.8, Exception No. 2, and 515.8(A). Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non-current-carrying metal parts.*

This exception permits the use of Type PVC or RTRC conduit in some underground installations. If these rigid nonmetallic conduits (RNC) are used for underground wiring, threaded rigid metal conduit or threaded steel intermediate metal conduit must be used for the last 2 ft of the underground run to the point of emergence or to the point of connection to the aboveground raceway. The RNC, including any nonmetallic conduit elbows and fittings, must be located not less than 2 ft below grade. The conduit must also be encased in not less than 2 in. of concrete.

The requirements covering the use of RNC in underground locations per 514.8, Exception No. 2, and 515.8 do not require concrete encasement. These provisions are for specific occupancies where there has been considerable experience with underground nonmetallic conduit. The exception to 501.10(A)(1)(a) applies to other occupancies that have been classified as a Class I, Division 1 location.

If rigid nonmetallic conduit (Type PVC or RTRC) is

used, an equipment grounding conductor must be included and must be bonded to the metal raceways that extend from the underground RNC.

(b) Type MI cable **terminated with fittings** listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

Termination fittings used with Type MI cable must be listed for use in Class I, Division 1 hazardous locations. This means that MI cable fittings must be evaluated in accordance with an appropriate product standard or be tested for the specific use. A fitting that is approved must be acceptable to the authority having jurisdiction, who, in many cases, requires the use of listed equipment as a basis for approval. However, the term *approved* does not mandate product evaluation or listing. The requirement that fittings used with MI cables be specifically listed for use in the particular hazardous location class and group involved provides an objective basis for selecting the proper fitting.

Type MI cable fittings not investigated for use in hazardous locations may not be explosionproof and hence not suitable for Class I, Division 1 locations. As illustrated in Exhibit 501.4, Type MI cable fittings have a clamp-type joint that must be investigated to determine that it is explosionproof.

(c) *In industrial establishments with restricted public access*, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable listed for use in **Class I, Zone 1** or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, and a separate equipment grounding conductor(s) in accordance with 250.122, and **terminated with fittings** listed for the application.

**EXHIBIT 501.4** Type MI cable and fitting listed for use in hazardous locations. The screw-on pot contains field-installed sealing compound to seal the end of the cable. The threaded gland has threads for connection to explosionproof enclosures. (Courtesy of Tyco Thermal Controls)

Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.

Due to the potential for physical damage to Type MC cable, its application is limited to Type MC-HL cable that is listed specifically for use in Class I, Division 1 locations and installed at facilities that have full-time, qualified maintenance personnel. Qualified maintenance personnel are those who, in the course of regular maintenance procedures, would notice whether cables were damaged, would understand the associated hazards, and are able to de-energize the circuit to repair the installation.

(d) *In industrial establishments with restricted public access*, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type ITC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material, and terminated with fittings listed for the application, and installed in accordance with the provisions of Article 727.

Type ITC-HL cable has a gastight/vaportight continuous corrugated metallic sheath and a polymeric jacket and is listed for use in Class I, Division 1 locations. It is permitted to be used in industrial facilities that have specific conditions of operation. The conditions under which Type ITC cable can be used in Class I, Division 1 locations parallel those in 501.10(A)(1)(c) for Type MC-HL cable.

**(2) Flexible Connections.** Where necessary to employ flexible connections, as at motor terminals, flexible fittings listed for the location, or flexible cord in accordance with the provisions of 501.140 terminated with cord connectors listed for the location, shall be permitted.

Flexible connection fittings are available in lengths up to 3 ft for use in Class I, Division 1 locations. A flexible connection fitting consists of a deeply corrugated metallic tube with an internal nonmetallic tubular protective liner and an outer cover of metallic braid. A threaded fitting is securely attached to each end of the flexible tube. This type of flexible fitting is commonly used at motor connections, can withstand continuous vibration for long periods, is explosion-proof, and affords maximum protection to any enclosed conductors. Section 501.10(A)(2) also permits limited use of flexible cord in accordance with 501.140 for specific applications where flexibility of the wiring method is made necessary by the type of equipment being supplied.

**(3) Boxes and Fittings.** All boxes and fittings shall be approved for Class I, Division 1.

Exhibit 501.5 shows an explosionproof junction box with two hubs and a threaded opening for the screw-type cover. Unused openings must be effectively closed by inserting threaded metal plugs that engage at least five full threads [ $4\frac{1}{2}$  permitted in accordance with 500.8(E), Exception] and afford protection equivalent to that of the wall of the box.

**EXHIBIT 501.5** An explosionproof junction box with a screw-type cover. (Courtesy of O-Z/Gedney, a division of EGS Electrical Group)

## **(B) Class I, Division 2.**

**(1) General.** In Class I, Division 2 locations, the following wiring methods shall be permitted:

- (1) All wiring methods permitted in 501.10(A).
- 
- (2) Enclosed gasketed busways and enclosed gasketed wireways.
- (3) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, including installation in cable tray systems. The cable shall be terminated with listed fittings.
- (4) Type ITC and Type ITC-ER cable as permitted in 727.4 and terminated with listed fittings.
- (5) Type MC, MV, or TC cable, including installation in cable tray systems. The cable shall be terminated with listed fittings.
- (6) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where metallic conduit does not provide sufficient corrosion resistance, listed reinforced

thermosetting resin conduit (RTRC), factory elbows, and associated fittings, all marked with the suffix -XW, and Schedule 80 PVC conduit, factory elbows, and associated fittings shall be permitted.

Where seals are required for boundary conditions as defined in 501.15(A)(4), the Division 1 wiring method shall extend into the Division 2 area to the seal, which shall be located on the Division 2 side of the Division 1–Division 2 boundary.

Section 501.10(B)(1)(6) permits the use of reinforced thermosetting resin conduit (RTRC) in industrial establishments where metallic conduit could be subject to corrosion. When using this provision, the boundary seal must be on the Division 2 side of a Division 1–Division 2 boundary.

**(2) Flexible Connections.** Where provision must be made for limited flexibility, one or more of the following shall be permitted:

- (1) Listed flexible metal fittings.
- (2) Flexible metal conduit with listed fittings.
- (3) Liquidtight flexible metal conduit with listed fittings.
- (4) Liquidtight flexible nonmetallic conduit with listed fittings.
- (5) Flexible cord listed for extra-hard usage and terminated with listed fittings. A conductor for use as an equipment grounding conductor shall be included in the flexible cord.

Informational Note: See 501.30(B) for grounding requirements where flexible conduit is used.

Type AC cable is not a permitted wiring method because of concern about arcing between convolutions during ground-fault conditions.

**(3) Nonincendive Field Wiring.** Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit, provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.

Informational Note: Simple apparatus is defined in 504.2.

Separate nonincendive field wiring circuits shall be installed in accordance with one of the following:

- (1) In separate cables
- (2) In multiconductor cables where the conductors of each circuit are within a grounded metal shield

- (3) In multiconductor cables or in raceways, where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.)

Any wiring method suitable for ordinary locations may be used for nonincendive field wiring. The rules for the installation of nonincendive field wiring are specified in 501.10(B)(3). Although many low-voltage, low-energy circuits, including some communications circuits and thermocouple circuits, are of the nonincendive type, a Class 2 circuit, as defined in Article 725, is not necessarily nonincendive. Testing laboratories, such as FM Approvals and Underwriters Laboratories Inc., list many types of equipment that have nonincendive circuits intended for connection of nonincendive field wiring. For additional information, see the commentary following 501.105(B)(1), Exception, and the definitions of *nonincendive circuit* and *nonincendive field wiring* in 500.2.

**(4) Boxes and Fittings.** Boxes and fittings shall not be required to be explosionproof except as required by 501.105(B)(1), 501.115(B)(1), and 501.150(B)(1).

In Class I, Division 2 locations, boxes, fittings, and joints are not required to be explosionproof when they contain no arcing devices; or for lighting outlets or enclosures containing non-arcing devices (such as solid-state relays, solenoids, and control transformers), if the maximum operating temperature of any exposed surface does not exceed 80 percent of the ignition temperature. However, when a general-purpose enclosure is installed using rigid or intermediate metal conduit, a bonding jumper with proper fittings or bonding-type locknuts is required to be used between the enclosure and the raceway to ensure adequate bonding from the hazardous area to the point of grounding at the service equipment or separately derived system. See 501.30 for grounding and bonding requirements.

Where necessary, limited flexibility is provided through use of flexible metal conduit, liquidtight flexible conduit, and extra-hard-usage flexible cord, and the fittings are not required to be specifically approved for Class I locations. Also, where flexible conduit or liquidtight flexible conduit is used, internal or external bonding jumpers with proper fittings must be provided in accordance with 501.30(B), unless liquidtight flexible conduit is installed under the conditions described in 501.30(B), Exception.

Section 501.10(B)(1) permits a variety of cable types, cable tray systems, enclosed gasketed wireways, and enclosed gasketed busways, each with associated fittings. These are not required to be specifically listed or labeled for Class I, Division 2 locations. For example, if Type ITC or

MC cable is used, neither the cable nor the fittings need to be listed for use in hazardous locations.

### 501.15 Sealing and Drainage

Commentary Table 501.1 summarizes the sealing requirements of 501.15(A) through (F).

Seals in conduit and cable systems shall comply with 501.15(A) through (F). Sealing compound shall be used in Type MI cable termination fittings to exclude moisture and other fluids from the cable insulation.

Informational Note No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal and through conductors passing through the seal. See 501.15(E)(2). Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. See 501.15(C)(2).

Informational Note No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the strands of standard stranded conductors larger than 2 AWG. Special conductor constructions, for example, compacted strands or sealing of the individual strands, are means of reducing leakage and preventing the propagation of flames.

Because the sealing compound used in conduit seal fittings is typically somewhat porous, gases, particularly those under slight pressure and those with small molecules such as hydrogen, may pass slowly through the compound.

Also, the seal is around the insulation on the conductor, and gases can be transmitted slowly through the air spaces (the interstices) between strands of stranded conductors. The cable core does not include the interstices of the conductor strands. Experience has shown, however, that under normal conditions for smaller conductors, and with only normal atmospheric pressure differentials across the seal, the passage of gas through a seal is not sufficient to result in a hazard. For larger conductors, however, gas or vapor leakage and flame propagation may occur through the interstices between the strands of stranded conductors. Special conductor constructions, such as compacted strands or sealing individual strands, may reduce leakage and prevent flame propagation.

Fittings should be sealed only with the sealing compound or compounds recommended by the fitting manufac-

turer. Different sealing compounds have different rates of expansion and contraction that may affect their performance within a given fitting. Sealing compound should be applied as soon as possible on Type MI cable terminations to exclude moisture from cable insulation.

Note that the use of Teflon tapes or joint compounds on conduit threads may weaken the seal fitting and interrupt the equipment grounding path. Cracks have developed in fittings during hydrostatic testing in which these materials were used.

**(A) Conduit Seals, Class I, Division 1.** In Class I, Division 1 locations, conduit seals shall be located in accordance with 501.15(A)(1) through (A)(4).

**(1) Entering Enclosures.** In each conduit entry into an explosionproof enclosure where either of the following apply:

- (1) The enclosure contains apparatus, such as switches, circuit breakers, fuses, relays, or resistors, that may produce arcs, sparks, or high temperatures that are considered to be an ignition source in normal operation.
- (2) The entry is metric designator 53 (trade size 2) or larger and the enclosure contains terminals, splices, or taps.

A sealing fitting must be placed within 18 in. of the entrance of trade size 2 or larger conduit into any explosionproof enclosure, regardless of whether the enclosure contains arcing or sparking equipment or only splices, taps, or terminals.

For the purposes of this section, high temperatures shall be considered to be any temperatures exceeding 80 percent of the autoignition temperature in degrees Celsius of the gas or vapor involved.

*Exception to 501.15(A)(1)(1): Seals shall not be required for conduit entering an enclosure where such switches, circuit breakers, fuses, relays, or resistors comply with one of the following:*

- (1) Are enclosed within a chamber hermetically sealed against the entrance of gases or vapors
- (2) Are immersed in oil in accordance with 501.115(B)(1)(2)
- (3) Are enclosed within a factory-sealed explosionproof chamber located within the enclosure, identified for the location, and marked "factory sealed" or equivalent, unless the enclosure entry is metric designator 53 (trade size 2) or larger
- (4) Are in nonincendive circuits

Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure that is required to have a conduit seal.

**COMMENTARY TABLE 501.1** Conduit and Cable Sealing Requirements

Classification	Application	Location of Seal
<b>Conduit Seals</b> Class I, Division 1	Switch enclosure Circuit breaker enclosure Fuse enclosure Relay enclosure Resistor enclosure Arcing or sparking apparatus High-temperature apparatus	In conduit run within 18 in. of enclosure
	Explosionproof enclosure containing arcing or sparking contacts that are hermetically sealed against gas or vapor entry Explosionproof enclosure containing arcing or sparking contacts that are immersed in oil, in accordance with 501.115(B)(1)(2)	In conduit runs smaller than trade size 2, no seal is required. If conduit is trade size 2 or larger, in conduit run within 18 in. of enclosure
	Enclosure containing terminals, splices, or taps fitting containing terminals, splices, or taps	In conduit runs smaller than trade size 2, no seal is required. If conduit is trade size 2 or larger, in conduit run within 18 in. of enclosure
	Two explosionproof enclosures with a conduit run between them of 36 in. or less	In conduit run within 18 in. of each enclosure. Permitted to use a single seal in each run as long as the seal is within 18 in. of each enclosure
	Two explosionproof enclosures with a conduit run between them greater than 36 in.	In conduit run within 18 in. of each enclosure
	Conduit run leaving Division 1 location	Within 10 ft of either side of boundary. No unions, couplings, boxes, or fittings (other than explosionproof reducers) permitted between the seal fitting and the point where the conduit leaves the Division 1 location.
	Metal conduit containing no unions, couplings, boxes, or fittings that passes completely through a Class I, Division 1 location, with no fittings less than 12 in. beyond each boundary	Not required to be sealed if the termination points of the unbroken conduit are in unclassified locations.
Class I, Division 2	Enclosure required to be explosionproof	Seal as required for similar equipment in Division 1 location
	Conduit run leaving Division 2 location	Within 10 ft of either side of boundary. No unions, couplings, boxes, or fittings (other than explosionproof reducers) permitted between the seal fitting and the point where the conduit leaves the Division 2 location. Not required to be explosionproof seal.
	Metal conduit containing no unions, couplings, boxes, or fittings that passes completely through a Division 2 location with no fittings less than 12 in. beyond each boundary	Not required to be sealed if the termination points of the unbroken conduit are in unclassified locations.
	Conduit systems terminating at an unclassified location where a wiring method transition is made to cable tray, cablebus, ventilated busway, Type MI cable, or open wiring	Not required to be sealed if passing from the Class I, Division 2 location into an outdoor unclassified location or an indoor location if the conduit system is all in one room. The conduits do not terminate at an enclosure containing an ignition source in normal operation.
	Conduit leaving a purged enclosure or room that is unclassified due to pressurization and entering a Division 2 location	Not required to be sealed at the boundary.

COMMENTARY TABLE 501.1 *Continued*

Classification	Application	Location of Seal
<b>Cable Seals</b> Class I, Division 1	Enclosure with integral seal	Conduit seal fitting not required
	Multiconductor Type MC-HL cables with a gastight/vaportight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material	Seal at all terminations with a listed fitting after removing the jacket and any other covering, so that the sealing compound surrounds each individual insulated conductor.
	Cables in conduit with a gastight/vaportight continuous sheath capable of transmitting gases or vapors through the cable core	Seal in the Division 1 location after removing the jacket and any other coverings, so that the sealing compound surrounds each individual insulated conductor and the outer jacket.
	Multiconductor cables with a gastight/vaportight continuous sheath capable of transmitting gases or vapors through the cable core	Permitted to be considered a single conductor by sealing the cable in the conduit within 18 in. of the enclosure and the cable end within the enclosure by an approved means, to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved methods.
	For shielded cables and twisted pair cables	Removal of the shielding material or separation of the twisted pair is not required. Sealing the cable in the conduit and the cable end within the enclosure by an approved means, to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved methods.
	Each multiconductor cable in conduit if the cable is incapable of transmitting gases or vapors through the cable core	Considered a single conductor. These cables are sealed in accordance with 501.15(A).
Class I, Division 2	Cables entering enclosures that are required to be explosionproof for Class I locations	Sealed at the point of entrance. These cables are sealed in accordance with the requirements of Division 1 locations.
	Multiconductor cables with a gastight/vaportight continuous sheath capable of transmitting gases or vapors through the cable core	Sealed in a listed fitting in the Division 2 location after removing the jacket and any other coverings, so that the sealing compound surrounds each individual insulated conductor.
	Multiconductor cables in conduit	Sealed in accordance with the requirements for Division 1 locations
	Cables with a gastight/vaportight continuous sheath that will not transmit gases or vapors through the cable core in excess of the quantity permitted for seal fittings. The minimum length of such cable run is not less than that length that limits gas or vapor flow through the cable core to the rate permitted for seal fittings (0.007 cu ft per hour of air at a pressure of 6 in. of water).	Not required to be sealed unless entering an enclosure that is required to be explosionproof.
	Cables with a gastight/vaportight continuous sheath capable of transmitting gases or vapors through the cable core	Not required to be sealed unless entering an enclosure that is required to be explosionproof or unless the cable is attached to process equipment or devices that may cause a pressure in excess of 6 in. of water to be exerted at a cable end, in which case a seal, barrier, or other means is provided to prevent migration of flammables into an unclassified area.
	Cables with an unbroken gastight/vaportight continuous sheath that pass through a Class I, Division 2 location	No seal required
	Cables that do not have a gastight/vaportight continuous sheath	Sealed at the boundary of the Division 2 and unclassified location in such a manner as to minimize the passage of gases or vapors into an unclassified location.

Conduit seals shall be installed within 450 mm (18 in.) from the enclosure. Only explosionproof unions, couplings, reducers, elbows, capped elbows, and conduit bodies similar to L, T, and Cross types that are not larger than the trade size of the conduit shall be permitted between the sealing fitting and the explosionproof enclosure.

The requirements for the location of conduit seals are to prevent an explosion from traveling through the conduit to another enclosure and to minimize the passage of gases or vapors from hazardous locations to nonhazardous locations. In Class 1, Division 1 locations, if the conduit enters an enclosure that contains arcing or high-temperature equipment, a sealing fitting must be placed within 18 in. of the enclosure it isolates. Only conduit bodies (“L,” “T,” etc.), couplings, unions, and elbows are permitted between the seal and the enclosure. Exhibit 501.6 illustrates an explosionproof type of union.

**EXHIBIT 501.6** An explosionproof union. (Courtesy of Thomas & Betts Corp.)

**(2) Pressurized Enclosures.** In each conduit entry into a pressurized enclosure where the conduit is not pressurized as part of the protection system. Conduit seals shall be installed within 450 mm (18 in.) from the pressurized enclosure.

Informational Note No. 1: Installing the seal as close as possible to the enclosure will reduce problems with purging the dead airspace in the pressurized conduit.

Informational Note No. 2: For further information, see NFPA 496-2008, *Standard for Purged and Pressurized Enclosures for Electrical Equipment*.

**(3) Two or More Explosionproof Enclosures.** Where two or more explosionproof enclosures for which conduit seals are required under 501.15(A)(1) are connected by nipples or by runs of conduit not more than 900 mm (36 in.) long, a single conduit seal in each such nipple connection or run of

conduit shall be considered sufficient if located not more than 450 mm (18 in.) from either enclosure.

The requirement for sealing two or more connected explosionproof enclosures is illustrated in Exhibit 501.7. If two enclosures are spaced not more than 36 in. apart as is the case with enclosures No. 1 and No. 2, a single seal may be placed between two connecting nipples if the seal is located not more than 18 in. from either enclosure. Even if Enclosure No. 3 was not required to be sealed, the seal within 18 in. of Enclosure No. 1 in the vertical run of conduit to Enclosure No. 3 is required because the conduit run to the “T” fitting is a conduit run from Enclosure No. 1.

**EXHIBIT 501.7** Two seals required so that the each run of conduit from Enclosure No. 1 is sealed.

**(4) Class I, Division 1 Boundary.** In each conduit run leaving a Class I, Division 1 location. The sealing fitting shall be permitted on either side of the boundary of such location within 3.05 m (10 ft) of the boundary and shall be designed and installed so as to minimize the amount of gas or vapor within the Division 1 portion of the conduit from being communicated to the conduit beyond the seal. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Division 1 location.

A sealing fitting is required at the boundary where the conduit leaves a Division 1 location or passes from a Division 2 location to an unclassified location per 501.15(B)(2). The sealing fitting is permitted on either side of the boundary, and no union, coupling, box, or similar fitting is permitted between the seal and the boundary. However, approved explosionproof reducers are permitted to be installed in conduit seals.

The sealing fitting is best located on the nonhazardous side of the boundary, where it will serve two purposes: completion of the explosionproof wiring method and completion of the explosionproof enclosure system. For example, even though a conduit seal is not required for ½-in. conduit connected to an explosionproof box that contains only splices, the required sealing fitting at the boundary of the Division 1 location serves to complete the explosionproof system. The sealing fitting at the boundary also prevents the conduit system from serving as a pipe to transmit flammable mixtures from either a Division 1 or a Division 2 location to an unclassified location.

*Exception No. 1: Metal conduit that contains no unions, couplings, boxes, or fittings, and passes completely through a Class I, Division 1 location with no fittings less than 300 mm (12 in.) beyond each boundary, shall not require a conduit seal if the termination points of the unbroken conduit are in unclassified locations.*

*Exception No. 2: For underground conduit installed in accordance with 300.5 where the boundary is below grade, the*

*sealing fitting shall be permitted to be installed after the conduit emerges from below grade, but there shall be no union, coupling, box, or fitting, other than listed explosionproof reducers at the sealing fitting, in the conduit between the sealing fitting and the point at which the conduit emerges from below grade.*

Exhibit 501.8 illustrates a Class I, Division 1 location using threaded rigid metal conduit or threaded intermediate metal conduit and explosionproof fittings and equipment, including motors, motor controllers, pushbutton stations, lighting outlets, and junction boxes. The enclosures for the disconnecting means and motor controller for the motor (right portion of the drawing) are placed on the other side of the wall in a nonhazardous location and are thus not required to be explosionproof.

Each of the three conduits is sealed on the nonhazardous side before passing into the hazardous location in accordance with 501.15(A)(4). The pigtail leads of both motors are factory sealed at the motor-terminal housing, and, unless the size of the flexible fitting entering the motor-terminal housing is trade size 2 or larger, no other seals are needed at this point. Because the pushbutton control station and the combination switch and starter (left portion of the drawing) are considered arc-producing devices, conduits are sealed within 18 in. of the entrance to these enclosures. Seals are required even though the contacts may be immersed in oil if the conduit is trade size 2 or larger.

Additionally, Exhibit 501.8 shows a seal provided within 18 in. of the switch controlling the lighting. The design of

**EXHIBIT 501.8** A Class I, Division 1 location where threaded metal conduits, sealing fittings, explosionproof fittings, and equipment for power and lighting are used.

the luminaire, as required by ANSI/UL 844, *Electric Lighting Fixtures for Use in Hazardous (Classified) Locations*, is such that the explosionproof chamber for the wiring must be separated or sealed from the lamp compartment; hence, a separate seal is not required adjacent to luminaires that comply with ANSI/UL 844. The luminaire is suspended on a conduit stem threaded into the cover of an explosionproof ceiling box. See 501.130 for luminaire requirements.

**(B) Conduit Seals, Class I, Division 2.** In Class I, Division 2 locations, conduit seals shall be located in accordance with 501.15(B)(1) and (B)(2).

**(1) Entering Enclosures.** For connections to enclosures that are required to be explosionproof, a conduit seal shall be provided in accordance with 501.15(A)(1)(1) and (A)(3). All portions of the conduit run or nipple between the seal and such enclosure shall comply with 501.10(A).

In Class I, Division 2 locations, a seal is required in each conduit entering an enclosure that is required to be explosionproof, in order to complete the explosionproof enclosure.

**(2) Class I, Division 2 Boundary.** In each conduit run passing from a Class I, Division 2 location into an unclassified location. The sealing fitting shall be permitted on either side of the boundary of such location within 3.05 m (10 ft) of the boundary. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the Division 2 location, and a threaded connection shall be used at the sealing fitting. Except for listed reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Division 2 location. Conduits shall be sealed to minimize the amount of gas or vapor within the Division 2 portion of the conduit from being communicated to the conduit beyond the seal. Such seals shall not be required to be explosionproof but shall be identified for the purpose of minimizing passage of gases under normal operating conditions and shall be accessible.

*Exception No. 1: Metal conduit that contains no unions, couplings, boxes, or fittings, and passes completely through a Class I, Division 2 location with no fittings less than 300 mm (12 in.) beyond each boundary, shall not be required to be sealed if the termination points of the unbroken conduit are in unclassified locations.*

*Exception No. 2: Conduit systems terminating at an unclassified location where a wiring method transition is made to cable tray, cablebus, ventilated busway, Type MI cable, or*

*cable not installed in any cable tray or raceway system shall not be required to be sealed where passing from the Class I, Division 2 location into the unclassified location. The unclassified location shall be outdoors or, if the conduit system is all in one room, it shall be permitted to be indoors. The conduits shall not terminate at an enclosure containing an ignition source in normal operation.*

*Exception No. 3: Conduit systems passing from an enclosure or room that is unclassified as a result of pressurization into a Class I, Division 2 location shall not require a seal at the boundary.*

Informational Note: For further information, refer to NFPA 496-2008, *Standard for Purged and Pressurized Enclosures for Electrical Equipment*.

*Exception No. 4: Segments of aboveground conduit systems shall not be required to be sealed where passing from a Class I, Division 2 location into an unclassified location if all of the following conditions are met:*

- (1) No part of the conduit system segment passes through a Class I, Division 1 location where the conduit contains unions, couplings, boxes, or fittings within 300 mm (12 in.) of the Class I, Division 1 location.*
- (2) The conduit system segment is located entirely in outdoor locations.*
- (3) The conduit system segment is not directly connected to canned pumps, process or service connections for flow, pressure, or analysis measurement, and so forth, that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the conduit system.*
- (4) The conduit system segment contains only threaded metal conduit, unions, couplings, conduit bodies, and fittings in the unclassified location.*
- (5) The conduit system segment is sealed at its entry to each enclosure or fitting housing terminals, splices, or taps in Class I, Division 2 locations.*

**(C) Class I, Divisions 1 and 2.** Seals installed in Class I, Division 1 and Division 2 locations shall comply with 501.15(C)(1) through (C)(6).

*Exception: Seals not required to be explosionproof by 501.15(B)(2) or 504.70.*

**(1) Fittings.** Enclosures for connections or equipment shall be provided with an integral means for sealing, or sealing fittings listed for the location shall be used. Sealing fittings shall be listed for use with one or more specific compounds and shall be accessible.

**(2) Compound.** The compound shall provide a seal against passage of gas or vapors through the seal fitting, shall not be

affected by the surrounding atmosphere or liquids, and shall not have a melting point of less than 93°C (200°F).

**(3) Thickness of Compounds.** Except for listed cable sealing fittings, the thickness of the sealing compound in a completed seal shall not be less than the metric designator (trade size) of the sealing fitting expressed in the units of measurement employed, and in no case less than 16 mm (5/8 in.).

Exhibit 501.9 illustrates the proper sealing of a fitting. A dam must be provided to prevent the sealing material, while still in the liquid state, from running out of the fitting. All conductors must be separated to permit the sealing material to run between them. The sealing compound must have a minimum thickness of not less than the trade size of the conduit and in no case less than 5/8 in. Conduit fittings for sealing are to be used only with sealing compound that is supplied with the fitting and specified by the manufacturer in instructions furnished with the fitting.

**EXHIBIT 501.9** A sealing fitting placed in a run of conduit to minimize the passage of gases from one portion of the electrical installation to another. (Courtesy of Appleton Electric Co., EGS Electrical Group)

To eliminate the time-consuming task of field-poured seals, a factory-sealed device with the seal designed into the device is permissible. A wide selection of factory-sealed devices is available for a variety of installations in hazardous locations. For example, explosionproof motors are normally factory-sealed and therefore require no additional seal. Factory-sealed devices are usually marked as such.

**(4) Splices and Taps.** Splices and taps shall not be made in fittings intended only for sealing with compound, nor shall other fittings in which splices or taps are made be filled with compound.

**(5) Assemblies.** In an assembly where equipment that may produce arcs, sparks, or high temperatures is located in a compartment separate from the compartment containing splices or taps, and an integral seal is provided where conductors pass from one compartment to the other, the entire assembly shall be identified for the location. Seals in conduit connections to the compartment containing splices or taps shall be provided in Class I, Division 1 locations where required by 501.15(A)(1)(2).

**(6) Conductor Fill.** The cross-sectional area of the conductors permitted in a seal shall not exceed 25 percent of the cross-sectional area of a rigid metal conduit of the same trade size unless it is specifically identified for a higher percentage of fill.

The maximum permitted fill for conduit is 40 percent (see Table 1, Chapter 9); the maximum fill permitted for most conduit seals is 25 percent. If the conduit fill exceeds 25 percent of the cross-sectional area of the sealing fitting, a larger trade size seal may be required. Reducers are allowed for connection of a larger trade size sealing fitting to the conduit per 501.15(A)(1).

**(D) Cable Seals, Class I, Division 1.** In Class I, Division 1 locations, cable seals shall be located according to 501.15(D)(1) through (D)(3).

**(1) At Terminations.** Cable shall be sealed at all terminations. The sealing fitting shall comply with 501.15(C). Multiconductor Type MC-HL cables with a gas/vaportight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material shall be sealed with a listed fitting after removing the jacket and any other covering so that the sealing compound surrounds each individual insulated conductor in such a manner as to minimize the passage of gases and vapors.

The sealing requirements for cables installed in Class I, Division 1 locations differ from the requirements for sealing conduits. As required by 501.15(A), conduits entering explosionproof enclosures must be sealed if the enclosure contains equipment that produces arcs, sparks, or high temperatures or if the conduit entering the enclosure is trade size 2 or larger. In accordance with 501.15(D)(1), however, cables must be sealed at all terminations, irrespective of the type of equipment contained in the enclosure or the diameter of the cable.

Type MC-HL cable, which is permitted by 501.10(A)(1)(c) as a wiring method in Class I, Division 1 locations, is specifically listed for use in these locations. It

has a continuous corrugated metallic sheath that is gastight/vaportight and an outer nonmetallic material that enables it to be installed in wet locations. Exhibit 501.10 shows an example of a cable sealing fitting for Type MC-HL cable.

**EXHIBIT 501.10** An explosionproof sealing fitting for Type MC-HL cable. (Courtesy of Cooper Crouse-Hinds)

*Exception: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs, provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.*

This exception permits shielded cables and twisted pair cables, commonly used for signaling and instrumentation circuits, to be sealed without removal of the outer sheathing or the separation of the twisted conductors. The need to provide a suitable seal while not adversely affecting the operational performance of these cables is accomplished through this exception.

## (2) Cables Capable of Transmitting Gases or Vapors.

Cables in conduit with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Division 1 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor and the outer jacket.

In addition to the cable seal, the end of the cable within the enclosure must also be sealed.

*Exception: Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be permitted to be considered*

*as a single conductor by sealing the cable in the conduit within 450 mm (18 in.) of the enclosure and the cable end within the enclosure by an approved means to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved methods. For shielded cables and twisted pair cables, it shall not be required to remove the shielding material or separate the twisted pair.*

The intent of this exception is to permit flat computer cables, coaxial cables, and twisted pair cables to be treated as single conductors if installed in conduit, because separating the individual conductors or removing the outer jacket (of a coaxial cable or a twisted pair, for example) is impractical and can destroy the electrical properties of the cable.

## (3) Cables Incapable of Transmitting Gases or Vapors.

Each multiconductor cable in conduit shall be considered as a single conductor if the cable is incapable of transmitting gases or vapors through the cable core. These cables shall be sealed in accordance with 501.15(A).

**(E) Cable Seals, Class I, Division 2.** In Class I, Division 2 locations, cable seals shall be located in accordance with 501.15(E)(1) through (E)(4).

**(1) Terminations.** Cables entering enclosures that are required to be explosionproof shall be sealed at the point of entrance. The sealing fitting shall comply with 501.15(B)(1). Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in a listed fitting in the Division 2 location after removing the jacket and any other coverings so that the sealing compound surrounds each individual insulated conductor in such a manner as to minimize the passage of gases and vapors. Multiconductor cables in conduit shall be sealed as described in 501.15(D).

*Exception No. 1: Cables passing from an enclosure or room that is unclassified as a result of Type Z pressurization into a Class I, Division 2 location shall not require a seal at the boundary.*

If cables are run from a Type Z pressurized room or enclosure into a Class I, Division 2 location, Exception No. 1 allows the cables to be installed without a sealing fitting at the boundary. This exception correlates with a similar allowance for conduit systems found in 501.15(B)(2), Exception No. 3.

*Exception No. 2: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs, provided the termination is*

*by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.*

**(2) Cables That Do Not Transmit Gases or Vapors.** Cables that have a gas/vaportight continuous sheath and do not transmit gases or vapors through the cable core in excess of the quantity permitted for seal fittings shall not be required to be sealed except as required in 501.15(E)(1). The minimum length of such cable run shall not be less than that length that limits gas or vapor flow through the cable core to the rate permitted for seal fittings [200 cm<sup>3</sup>/hr (0.007 ft<sup>3</sup>/hr) of air at a pressure of 1500 pascals (6 in. of water)].

The ability of a cable to transmit gases or vapors through the core (primarily between insulated conductors) depends not only on how tightly packed the conductors are within the outer sheaths and the location and composition of fillers but also on how the cable has been handled and the geometry of the cable run. If there is any concern that the cable run is capable of transmitting gases or vapors through the core, a sealing fitting should be installed. See the commentary following 501.15, Informational Note No. 2.

**Informational Note:** The cable core does not include the interstices of the conductor strands.

To conduct a leak rate test to measure the gas flow through a cable core, the ends of each individual conductor in the cable are sealed to prevent migration of gases or vapors between the individual strands of wire. Sealing can be achieved by dipping the cable end in hot wax. The rate of flow through the filler between the insulated conductors can then be accurately measured, excluding any leakage through the conductor strands. If this is done, the wax should be removed before the connections are made and the system is placed in service.

**(3) Cables Capable of Transmitting Gases or Vapors.** Cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall not be required to be sealed except as required in 501.15(E)(1), unless the cable is attached to process equipment or devices that may cause a pressure in excess of 1500 pascals (6 in. of water) to be exerted at a cable end, in which case a seal, barrier, or other means shall be provided to prevent migration of flammables into an unclassified location.

*Exception: Cables with an unbroken gas/vaportight continuous sheath shall be permitted to pass through a Class I, Division 2 location without seals.*

**(4) Cables Without Gas/Vaportight Sheath.** Cables that do not have gas/vaportight continuous sheath shall be sealed

at the boundary of the Division 2 and unclassified location in such a manner as to minimize the passage of gases or vapors into an unclassified location.

#### **(F) Drainage.**

Exhibit 501.11 shows a sealing fitting designed for use in a vertical run of conduit to provide drainage for any condensation of moisture trapped by the seal above the enclosure. Any accumulation of water runs down over the surface of the sealing compound, flowing through an explosionproof drain.

**EXHIBIT 501.11** A sealing fitting with an automatic drain plug.  
(Courtesy of Appleton Electric Co., EGS Electrical Group)

Exhibit 501.12 shows a combination drain and breather fitting. This type of fitting is specifically designed to permit the escape of accumulated water through its drain, and allow the continuous circulation of air through the breather,

**EXHIBIT 501.12** A combination breather-drainage fitting.  
(Courtesy of Appleton Electric Co., EGS Electrical Group)

preventing condensation of any moisture that may be present while still providing positive explosionproof protection. Individual drain or breather fittings are also available. It is good practice to consider the installation of drain, breather, or combination fittings to guard against water accumulation, which can cause future insulation failures, even though prevalent conditions may not indicate a need.

**(1) Control Equipment.** Where there is a probability that liquid or other condensed vapor may be trapped within enclosures for control equipment or at any point in the raceway system, approved means shall be provided to prevent accumulation or to permit periodic draining of such liquid or condensed vapor.

**(2) Motors and Generators.** Where the authority having jurisdiction judges that there is a probability that liquid or condensed vapor may accumulate within motors or generators, joints and conduit systems shall be arranged to minimize the entrance of liquid. If means to prevent accumulation or to permit periodic draining are judged necessary, such means shall be provided at the time of manufacture and shall be considered an integral part of the machine.

### 501.17 Process Sealing

This section shall apply to process-connected equipment, which includes, but is not limited to, canned pumps, submersible pumps, flow, pressure, temperature, or analysis measurement instruments. A process seal is a device to prevent the migration of process fluids from the designed containment into the external electrical system. Process connected electrical equipment that incorporates a single process seal, such as a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering a conduit or cable system capable of transmitting fluids, shall be provided with an additional means to mitigate a single process seal failure. The additional means may include, but is not limited to the following:

- (1) A suitable barrier meeting the process temperature and pressure conditions that the barrier will be subjected to upon failure of the single process seal. There shall be a vent or drain between the single process seal and the suitable barrier. Indication of the single process seal failure shall be provided by visible leakage, an audible whistle, or other means of monitoring.
- (2) A listed Type MI cable assembly, rated at not less than 125 percent of the process pressure and not less than 125 percent of the maximum process temperature (in degrees Celsius), installed between the cable or conduit and the single process seal.

- (3) A drain or vent located between the single process seal and a conduit or cable seal. The drain or vent shall be sufficiently sized to prevent overpressuring the conduit or cable seal above 6 in. water column (1493 Pa). Indication of the single process seal failure shall be provided by visible leakage, an audible whistle, or other means of monitoring.

Process-connected electrical equipment that does not rely on a single process seal or is listed and marked “single seal” or “dual seal” shall not be required to be provided with an additional means of sealing.

**Informational Note:** For construction and testing requirements for process sealing for listed and marked “single seal” or “dual seal” requirements, refer to ANSI/ISA-12.27.01-2003, *Requirements for Process Sealing Between Electrical Systems and Potentially Flammable or Combustible Process Fluids*.

This section is new in the 2011 *Code*. Many of these requirements were formerly located in 501.15(F)(3). In addition to the primary seal provided with canned pumps and other process equipment that operate above atmospheric pressure, 501.17 requires a second means to prevent fluid from entering the electrical conduit or cable system if the primary seal fails. Former 515.15(F)(3) has been completely rewritten for the 2011 *Code* to clearly state the requirements for process sealing.

The application of pressure or exposure to extreme temperatures must be prevented at the additional seal or barrier so that the process fluid will not enter the conduit system if the primary seal fails. This protection may be accomplished through the use of MI cable rated 125 percent of the process temperature and pressure or through the use of a vent or drain. If the process fluid is a gas or can become a gas under ordinary atmospheric conditions (liquefied natural gas, for example), the drain should be a vent. In addition to this seal or barrier, a drain, vent, or other device that indicates failure of the primary seal must be provided.

This redundant protection system may be achieved by installing a vented junction (box) enclosure within the classified area where the conductors terminate on busbars. Terminating the conductors in this manner allows any fluid that escapes through the primary seal and that has traveled through the stranding of the conductors to vent at the terminations. The circuit continues through the vented enclosure at normal atmospheric pressure to another set of conductors that also must be sealed with a sealing fitting if they travel into a different classified area. A gas detector can be installed in the vicinity of the vented termination box to signal that the primary seal has failed and allow an orderly shutdown of the process system either automatically or manually.

### 501.20 Conductor Insulation, Class I, Divisions 1 and 2

Where condensed vapors or liquids may collect on, or come in contact with, the insulation on conductors, such insulation shall be of a type identified for use under such conditions; or the insulation shall be protected by a sheath of lead or by other approved means.

In areas exposed to gasoline, nylon-jacketed conductors, such as Type THWN, have gained widespread acceptance because of their ease in handling and application as well as for economic reasons.

### 501.25 Uninsulated Exposed Parts, Class I, Divisions 1 and 2

There shall be no uninsulated exposed parts, such as electrical conductors, buses, terminals, or components, that operate at more than 30 volts (15 volts in wet locations). These parts shall additionally be protected by a protection technique according to 500.7(E), (F), or (G) that is suitable for the location.

Exposed live parts are permitted in Class I, Division 1 and 2 locations provided the voltage does not exceed 30 volts in dry locations or 15 volts in wet locations and the parts are protected by either intrinsically safe or nonincendive techniques (as applicable). Caution must be observed in working around uninsulated exposed parts because tools or other conductive items that come in contact with the circuit could produce sparks and cause an explosion in a hazardous location.

### 501.30 Grounding and Bonding, Class I, Divisions 1 and 2

Wiring and equipment in Class I, Division 1 and 2 locations shall be grounded as specified in Article 250 and in accordance with the requirements of 501.30(A) and (B).

**(A) Bonding.** The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, and so forth between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.

*Exception: The specific bonding means shall be required only to the nearest point where the grounded circuit conduc-*

*tor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in 250.32(B), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means.*

Informational Note: See 250.100 for additional bonding requirements in hazardous (classified) locations.

Section 501.30(A) specifies bonding requirements intended to address the unique hazards inherent in Class I, Division 1 or Division 2 locations, which are also covered in 250.100. These specific bonding methods, intended to provide a mechanical/electrical connection that is low impedance and free from accidental arcing due to loose connections, apply to raceways and raceway-to-enclosure connections both inside and outside the hazardous location. Section 250.100 specifies this enhanced level of bonding for all raceways and enclosures, and the requirement is not contingent on the circuit voltage. Therefore metal raceways and enclosures containing signaling, communications, or other power-limited circuits are covered.

To be effective, proper grounding and bonding apply to all interconnected raceways, fittings, enclosures, and so on, between hazardous locations and the point of grounding for service equipment or the point of grounding of the building disconnecting means that supplies the branch-circuit overcurrent protection. If conduit is used in hazardous locations, it is preferable that threaded connections also be employed in the nonhazardous location.

Section 250.100 clarifies that the installation of a wire-type equipment grounding conductor in a metal raceway does not negate the special raceway and enclosure bonding requirements. Unless it is an isolated equipment grounding conductor as permitted by 250.96(B) or 250.146(D), the wire-type equipment grounding conductor and the metal raceway will be electrically in parallel and will share ground-fault current based on the impedance of the wire and of the metal raceway. For that reason, the electrical continuity of raceways and raceway-to-enclosure connections must always be ensured through compliance with 250.100 and 501.30(A), regardless of whether a supplementary equipment grounding conductor has been installed in the raceway.

The exception covers the grounding and bonding requirements that are specific to hazardous locations where the installation occurs at a multibuilding or multistructure setting. If the service equipment and the electrical equipment operating in the hazardous location are not located in the same building or structure, applying the bonding requirement of 501.30(A) from the hazardous location back to the service equipment is not necessary. It is necessary only to apply the bonding requirement from the hazardous location

back to the grounding electrode on the line side of the building or structure disconnecting means. This connection must be ahead of the branch circuits that are on the load side of the disconnecting means for the building or structure.

**(B) Types of Equipment Grounding Conductors.** Flexible metal conduit and liquidtight flexible metal conduit shall include an equipment bonding jumper of the wire type in compliance with 250.102.

Special consideration is necessary in the grounding and bonding of exposed non-current-carrying metal parts of equipment, such as the frames or metal exteriors of motors, fixed or portable lamps, luminaires, enclosures, and raceways. Although flexible metal conduits are permitted by 250.118 to function as an equipment grounding conductor in a hazardous location unless otherwise permitted by the exception to 510.30(B), they are required to be installed with a wire-type bonding jumper. The intent is to ensure permanent and effective mechanical and electrical connections in order to prevent the possibility of arcs or sparks caused by ineffective or poor grounding methods. Exhibit 501.13 illustrates an equipment bonding jumper routed outside of flexible metal conduit for a length not to exceed 6 ft in accordance with 250.102(E).

**EXHIBIT 501.13** The connection of an external bonding jumper used with liquidtight flexible metal conduit.

*Exception:* In Class I, Division 2 locations, the bonding jumper shall be permitted to be deleted where all of the following conditions are met:

- (1) Listed liquidtight flexible metal conduit 1.8 m (6 ft) or less in length, with fittings listed for grounding, is used.
- (2) Overcurrent protection in the circuit is limited to 10 amperes or less.
- (3) The load is not a power utilization load.

### 501.35 Surge Protection

**(A) Class I, Division 1.** Surge arresters, surge-protective devices, and capacitors shall be installed in enclosures identified for Class I, Division 1 locations. Surge-protective capacitors shall be of a type designed for specific duty.

**(B) Class I, Division 2.** Surge arresters and surge-protective devices shall be nonarcing, such as metal-oxide varistor (MOV) sealed type, and surge-protective capacitors shall be of a type designed for specific duty. Enclosures shall be permitted to be of the general-purpose type. Surge protection of types other than described in this paragraph shall be installed in enclosures identified for Class I, Division 1 locations.

Unlike the Division 1 explosionproof or purged enclosure requirement for all surge arresters and surge protective devices (SPDs), in Class I, Division 2 locations, only spark-producing types of surge arresters require installation in an enclosure identified for the location. Nonarcing, sealed, and solid-state type SPDs are also permitted in Class I, Division 2 locations where installed in a general purpose-type enclosure. For further information on SPDs, refer to Article 285, which delineates SPD types by the voltage rating of the supply system. Surge arresters can also be installed in oil-filled enclosures or have the arcing or sparking contacts enclosed in hermetically sealed chambers.

### 501.40 Multiwire Branch Circuits

In a Class I, Division 1 location, a multiwire branch circuit shall not be permitted.

*Exception:* Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.

Multiwire branch circuits are not permitted in Class I, Division 1 hazardous locations unless the disconnecting device opens all the ungrounded conductors of the multiwire branch circuit simultaneously. See the definition of *branch circuit, multiwire* in Article 100. The requirement in 501.40 addresses the inherent hazard of working on a multiwire branch circuit in which all the ungrounded conductors are not opened by the disconnecting means. Although the ungrounded conductor that is supplying equipment being serviced may be disconnected, the common grounded conductor in this circuit configuration is still a current-carrying conductor in a circuit with an ungrounded conductor(s) that is not disconnected. In a Division 1 or 2 location, the opening of the grounded conductor in this scenario could result in an ignition-capable arc.

### III. Equipment

#### 501.100 Transformers and Capacitors

**(A) Class I, Division 1.** In Class I, Division 1 locations, transformers and capacitors shall comply with 501.100(A)(1) and (A)(2).

**(1) Containing Liquid That Will Burn.** Transformers and capacitors containing a liquid that will burn shall be installed only in vaults that comply with 450.41 through 450.48 and with (1) through (4) as follows:

- (1) There shall be no door or other communicating opening between the vault and the Division 1 location.
- (2) Ample ventilation shall be provided for the continuous removal of flammable gases or vapors.
- (3) Vent openings or ducts shall lead to a safe location outside of buildings.
- (4) Vent ducts and openings shall be of sufficient area to relieve explosion pressures within the vault, and all portions of vent ducts within the buildings shall be of reinforced concrete construction.

**(2) Not Containing Liquid That Will Burn.** Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with 501.100(A)(1) or be identified for Class I locations.

**(B) Class I, Division 2.** In Class I, Division 2 locations, transformers shall comply with 450.21 through 450.27, and capacitors shall comply with 460.2 through 460.28.

#### 501.105 Meters, Instruments, and Relays

**(A) Class I, Division 1.** In Class I, Division 1 locations, meters, instruments, and relays, including kilowatt-hour meters, instrument transformers, resistors, rectifiers, and thermionic tubes, shall be provided with enclosures identified for Class I, Division 1 locations. Enclosures for Class I, Division 1 locations include explosionproof enclosures and purged and pressurized enclosures.

Informational Note: See NFPA 496-2008, *Standard for Purged and Pressurized Enclosures for Electrical Equipment*.

For additional information, see the commentary following 500.7(D) on purged and pressurized enclosures and the commentary following 501.1 on explosionproof enclosures.

**(B) Class I, Division 2.** In Class I, Division 2 locations, meters, instruments, and relays shall comply with 501.105(B)(1) through (B)(6).

**(1) Contacts.** Switches, circuit breakers, and make-and-break contacts of pushbuttons, relays, alarm bells, and horns shall have enclosures identified for Class I, Division 1 locations in accordance with 501.105(A).

*Exception: General-purpose enclosures shall be permitted if current-interrupting contacts comply with one of the following:*

- (1) *Are immersed in oil*
- (2) *Are enclosed within a chamber that is hermetically sealed against the entrance of gases or vapors*
- (3) *Are in nonincendive circuits*
- (4) *Are listed for Division 2*

This exception identifies the conditions under which general-purpose enclosures are permitted for meters, relays and other instruments containing arcing contacts in Class 1, Division 2 locations. One such condition is the use of hermetic seals, which include fusion seals such as the glass-to-metal seals in mercury-tube switches and some reed switches, welded seals, and soldered seals. Seals of the glass-to-metal-fusion type are usually the most reliable. Soft soldered seals can be relatively porous, and their effectiveness is highly dependent on workmanship. Although gasketed seals can be very effective, depending on the gasket material used, gasket materials can be damaged and deteriorate rapidly if exposed to atmospheres that contain solvent vapors. Gasketed enclosures may be considered hermetically sealed under some conditions; however, in accordance with the 500.2 definition of *hermetically sealed*, such enclosures cannot be used to satisfy those requirements in which hermetic sealing is recognized as a protection technique.

Another condition allowing for the use of general-purpose enclosures is that the contact circuit be nonincendive. See the definitions of the terms *nonincendive circuit*, *nonincendive component*, and *nonincendive equipment* in 500.2. *Nonincendive* is similar to *intrinsically safe*, which is defined in 504.2, but *nonincendive* does not include consideration of faults and the abnormal conditions inherent in the definition of *intrinsically safe*.

**(2) Resistors and Similar Equipment.** Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment that are used in or in connection with meters, instruments, and relays shall comply with 501.105(A).

*Exception: General-purpose-type enclosures shall be permitted if such equipment is without make-and-break or sliding contacts [other than as provided in 501.105(B)(1)] and if the maximum operating temperature of any exposed surface will not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved or has been*

*tested and found incapable of igniting the gas or vapor. This exception shall not apply to thermionic tubes.*

**(3) Without Make-or-Break Contacts.** Transformer windings, impedance coils, solenoids, and other windings that do not incorporate sliding or make-or-break contacts shall be provided with enclosures. General-purpose-type enclosures shall be permitted.

**(4) General-Purpose Assemblies.** Where an assembly is made up of components for which general-purpose enclosures are acceptable as provided in 501.105(B)(1), (B)(2), and (B)(3), a single general-purpose enclosure shall be acceptable for the assembly. Where such an assembly includes any of the equipment described in 501.105(B)(2), the maximum obtainable surface temperature of any component of the assembly shall be clearly and permanently indicated on the outside of the enclosure. Alternatively, equipment shall be permitted to be marked to indicate the temperature class for which it is suitable, using the temperature class (T Code) of Table 500.8(C).

**(5) Fuses.** Where general-purpose enclosures are permitted in 501.105(B)(1) through (B)(4), fuses for overcurrent protection of instrument circuits not subject to overloading in normal use shall be permitted to be mounted in general-purpose enclosures if each such fuse is preceded by a switch complying with 501.105(B)(1).

**(6) Connections.** To facilitate replacements, process control instruments shall be permitted to be connected through flexible cord, attachment plug, and receptacle, provided all of the following conditions apply:

- (1) A switch complying with 501.105(B)(1) is provided so that the attachment plug is not depended on to interrupt current.
- (2) The current does not exceed 3 amperes at 120 volts, nominal.
- (3) The power-supply cord does not exceed 900 mm (3 ft), is of a type listed for extra-hard usage or for hard usage if protected by location, and is supplied through an attachment plug and receptacle of the locking and grounding type.
- (4) Only necessary receptacles are provided.
- (5) The receptacle carries a label warning against unplugging under load.

### 501.115 Switches, Circuit Breakers, Motor Controllers, and Fuses

**(A) Class I, Division 1.** In Class I, Division 1 locations, switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices, shall be provided with enclosures, and the enclosure in each case,

together with the enclosed apparatus, shall be identified as a complete assembly for use in Class I locations.

Specific devices are required to be in enclosures identified for use in Class I, Division 1 locations. For example, Exhibit 501.14 shows an explosionproof panelboard that consists of an assembly of branch-circuit devices enclosed in a cast metal explosionproof housing. Explosionproof panelboards are provided with bolted access covers and threaded conduit-entry hubs designed to withstand the force of an internal explosion.

**EXHIBIT 501.14** An explosionproof panelboard. (Courtesy of Appleton Electric Co., EGS Electrical Group)

Exhibit 501.15 shows a cylindrical-type (spin-top) combination motor controller, motor control starter, and circuit breaker in an explosionproof enclosure. The top and bottom covers are threaded on for quick removal for installation and servicing. Exhibit 501.16 shows the same type of equipment in a rectangular enclosure with a hinged, bolted-on cover. These types of housings are designed to accommodate a wide range of manually or magnetically operated across-the-line types of motor starters in a variety of ratings.

Exhibit 501.17 illustrates a standard toggle switch in an explosionproof enclosure.

**(B) Class I, Division 2.** Switches, circuit breakers, motor controllers, and fuses in Class I, Division 2 locations shall comply with 501.115(B)(1) through (B)(4).

**EXHIBIT 501.15** An explosionproof enclosure for a motor control starter and circuit breaker. (Courtesy of Appleton Electric Co., EGS Electrical Group)

**EXHIBIT 501.16** A magnetic motor starter for use in a Class I, Group D location. Note the number of securing bolts and the width of the flange. (Courtesy of O-Z/Gedney, a division of EGS Electrical Group)

**(1) Type Required.** Circuit breakers, motor controllers, and switches intended to interrupt current in the normal performance of the function for which they are installed shall be provided with enclosures identified for Class I, Division

**EXHIBIT 501.17** A standard toggle switch in an explosionproof enclosure. (Courtesy of Appleton Electric Co., EGS Electrical Group)

1 locations in accordance with 501.105(A), unless general-purpose enclosures are provided and any of the following apply:

- (1) The interruption of current occurs within a chamber hermetically sealed against the entrance of gases and vapors.
- (2) The current make-and-break contacts are oil-immersed and of the general-purpose type having a 50-mm (2-in.) minimum immersion for power contacts and a 25-mm (1-in.) minimum immersion for control contacts.
- (3) The interruption of current occurs within a factory-sealed explosionproof chamber.
- (4) The device is a solid state, switching control without contacts, where the surface temperature does not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved.

**(2) Isolating Switches.** Fused or unfused disconnect and isolating switches for transformers or capacitor banks that are not intended to interrupt current in the normal performance of the function for which they are installed shall be permitted to be installed in general-purpose enclosures.

**(3) Fuses.** For the protection of motors, appliances, and lamps, other than as provided in 501.115(B)(4), standard plug or cartridge fuses shall be permitted, provided they are placed within enclosures identified for the location; or fuses shall be permitted if they are within general-purpose enclosures, and if they are of a type in which the operating element is immersed in oil or other approved liquid, or the operating element is enclosed within a chamber hermetically sealed against the entrance of gases and vapors, or the fuse is a nonindicating, filled, current-limiting type.

**(4) Fuses Internal to Luminaires.** Listed cartridge fuses shall be permitted as supplementary protection within luminaires.

### 501.120 Control Transformers and Resistors

Transformers, impedance coils, and resistors used as, or in conjunction with, control equipment for motors, generators, and appliances shall comply with 501.120(A) and (B).

**(A) Class I, Division 1.** In Class I, Division 1 locations, transformers, impedance coils, and resistors, together with any switching mechanism associated with them, shall be provided with enclosures identified for Class I, Division 1 locations in accordance with 501.105(A).

**(B) Class I, Division 2.** In Class I, Division 2 locations, control transformers and resistors shall comply with 501.120(B)(1) through (B)(3).

**(1) Switching Mechanisms.** Switching mechanisms used in conjunction with transformers, impedance coils, and resistors shall comply with 501.115(B).

**(2) Coils and Windings.** Enclosures for windings of transformers, solenoids, or impedance coils shall be permitted to be of the general-purpose type.

**(3) Resistors.** Resistors shall be provided with enclosures; and the assembly shall be identified for Class I locations, unless resistance is nonvariable and maximum operating temperature, in degrees Celsius, will not exceed 80 percent of the ignition temperature of the gas or vapor involved or has been tested and found incapable of igniting the gas or vapor.

### 501.125 Motors and Generators

**(A) Class I, Division 1.** In Class I, Division 1 locations, motors, generators, and other rotating electrical machinery shall be one of the following:

- (1) Identified for Class I, Division 1 locations
- (2) Of the totally enclosed type supplied with positive-pressure ventilation from a source of clean air with discharge to a safe area, so arranged to prevent energizing of the machine until ventilation has been established and the enclosure has been purged with at least 10 volumes of air, and also arranged to automatically de-energize the equipment when the air supply fails
- (3) Of the totally enclosed inert gas-filled type supplied with a suitable reliable source of inert gas for pressurizing the enclosure, with devices provided to ensure a positive pressure in the enclosure and arranged to automatically de-energize the equipment when the gas supply fails
- (4) Of a type designed to be submerged in a liquid that is flammable only when vaporized and mixed with air, or in a gas or vapor at a pressure greater than atmospheric

and that is flammable only when mixed with air; and the machine is so arranged to prevent energizing it until it has been purged with the liquid or gas to exclude air, and also arranged to automatically de-energize the equipment when the supply of liquid or gas or vapor fails or the pressure is reduced to atmospheric

The intent of 501.125(A)(4) is to permit nonexplosionproof motors to be submerged in liquefied natural gas (LNG), liquefied petroleum gas (LP-Gas), gasoline, and other flammable liquids. This provision does not permit nonexplosionproof motors under the liquid, such as in wet pits, unless the motors are provided with some other system of explosion protection — for example, if they are purged and pressurized per NFPA 496, *Standard for Purged and Pressurized Enclosures for Electrical Equipment*.

Totally enclosed motors of the types specified in 501.125(A)(2) or (A)(3) shall have no external surface with an operating temperature in degrees Celsius in excess of 80 percent of the ignition temperature of the gas or vapor involved. Appropriate devices shall be provided to detect and automatically de-energize the motor or provide an adequate alarm if there is any increase in temperature of the motor beyond designed limits. Auxiliary equipment shall be of a type identified for the location in which it is installed.

Informational Note: See D2155-69, *ASTM Test Procedure*.

**(B) Class I, Division 2.** In Class I, Division 2 locations, motors, generators, and other rotating electrical machinery in which are employed sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices, either while starting or while running, shall be identified for Class I, Division 1 locations, unless such sliding contacts, switching mechanisms, and resistance devices are provided with enclosures identified for Class I, Division 2 locations in accordance with 501.105(B). The exposed surface of space heaters used to prevent condensation of moisture during shutdown periods shall not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved when operated at rated voltage, and the maximum space heater surface temperature [based on a 40°C or higher marked ambient] shall be permanently marked on a visible nameplate mounted on the motor. Otherwise, space heaters shall be identified for Class I, Division 2 locations. In Class I, Division 2 locations, the installation of open or nonexplosionproof enclosed motors, such as squirrel-cage induction motors without brushes, switching mechanisms, or similar arc-producing devices that are not identified for use in a Class I, Division 2 location, shall be permitted.

The phrase “other rotating electrical machinery” in 501.125(A) and (B) includes electric brakes. Listed and labeled electric brakes are available for Class I, Division 1, Group C and D locations.

Motors with arcing devices such as commutators are required to be provided with an enclosure identified for the location, such as explosionproof. Other motor types, such as a squirrel-cage induction motor, without arcing devices are permitted without special enclosures. Additionally, indication of the maximum temperature present in a motor is critical to proper installation. Many motor heaters are de-energized automatically when the motor is running. However, the heater ratings are usually low when compared with the normal heat generated during motor operation. Unless otherwise indicated on the motor wiring diagram or in instructions provided with the motor, there is no need to de-energize the heater except to save energy. The heater temperature must be marked on the motor or the heater must be identified for the location.

Informational Note No. 1: It is important to consider the temperature of internal and external surfaces that may be exposed to the flammable atmosphere.

Informational Note No. 2: It is important to consider the risk of ignition due to currents arcing across discontinuities and overheating of parts in multisection enclosures of large motors and generators. Such motors and generators may need equipotential bonding jumpers across joints in the enclosure and from enclosure to ground. Where the presence of ignitable gases or vapors is suspected, clean-air purging may be needed immediately prior to and during start-up periods.

Informational Note No. 3: For further information on the application of electric motors in Class I, Division 2 hazardous (classified) locations, see IEEE Std. 1349-2001, *IEEE Guide for the Application of Electric Motors in Class I, Division 2 Hazardous (Classified) Locations*.

The informational notes identify unique issues that apply to motors in Class I, Division 2 locations. High inertia loads can cause increased rotor heating during starting, and sparking can occur between motor housing assemblies when starting. See IEEE Standard 1349, *Guide for the Application of Electric Motors in Class I, Division 2 Hazardous (Classified) Locations*, for complete details.

Motor types used where flammable gases or vapors with very low ignition temperatures may be present should be selected with great care. Modern motors with high-temperature insulation systems, such as Class H [180°C (356°F)], may operate close to or above the ignition temperature of the flammable mixture.

Exhibits 501.18 and 501.19 show a totally enclosed fan-cooled motor listed for use in explosive atmospheres. The

**EXHIBIT 501.18** Terminal housing of a motor listed for use in specific hazardous locations. Note integral sealing of the motor. (Courtesy of General Electric Co.)

**EXHIBIT 501.19** View showing internal fan of motor in Exhibit 501.18. (Courtesy of General Electric Co.)

main frame and end-bells are designed with sufficient strength to withstand an internal explosion. Flames or hot gases are cooled while escaping because of the wide metal-to-metal joints between the frame and the end-bells and the long, close-tolerance clearance provided for the free turn of the shaft. Air circulation outside the motor is maintained by a nonsparking (aluminum, bronze, or non-static-generating-type plastic) fan on the end opposite the shaft end of the

motor. A sheet metal housing surrounds the fan to reduce the likelihood of an individual or object coming into contact with the moving blades and to direct the flow of air. An internal fan on the shaft, as shown in Exhibit 501.19, circulates air around the windings.

### 501.130 Luminaires

Luminaires shall comply with 501.130(A) or (B).

**(A) Class I, Division 1.** In Class I, Division 1 locations, luminaires shall comply with 501.130(A)(1) through (A)(4).

**(1) Luminaires.** Each luminaire shall be identified as a complete assembly for the Class I, Division 1 location and shall be clearly marked to indicate the maximum wattage of lamps for which it is identified. Luminaires intended for portable use shall be specifically listed as a complete assembly for that use.

**(2) Physical Damage.** Each luminaire shall be protected against physical damage by a suitable guard or by location.

**(3) Pendant Luminaires.** Pendant luminaires shall be suspended by and supplied through threaded rigid metal conduit stems or threaded steel intermediate conduit stems, and threaded joints shall be provided with set-screws or other effective means to prevent loosening. For stems longer than 300 mm (12 in.), permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm (12 in.) above the lower end of the stem, or flexibility in the form of a fitting or flexible connector identified for the Class I, Division 1 location shall be provided not more than 300 mm (12 in.) from the point of attachment to the supporting box or fitting.

**(4) Supports.** Boxes, box assemblies, or fittings used for the support of luminaires shall be identified for Class I locations.

**(B) Class I, Division 2.** In Class I, Division 2 locations, luminaires shall comply with 501.130(B)(1) through (B)(6).

**(1) Luminaires.** Where lamps are of a size or type that may, under normal operating conditions, reach surface temperatures exceeding 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved, luminaires shall comply with 501.130(A)(1) or shall be of a type that has been tested in order to determine the marked operating temperature or temperature class (T Code).

**(2) Physical Damage.** Luminaires shall be protected from physical damage by suitable guards or by location. Where there is danger that falling sparks or hot metal from lamps or

luminaires might ignite localized concentrations of flammable vapors or gases, suitable enclosures or other effective protective means shall be provided.

**(3) Pendant Luminaires.** Pendant luminaires shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, or other approved means. For rigid stems longer than 300 mm (12 in.), permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm (12 in.) above the lower end of the stem, or flexibility in the form of an identified fitting or flexible connector shall be provided not more than 300 mm (12 in.) from the point of attachment to the supporting box or fitting.

**(4) Portable Lighting Equipment.** Portable lighting equipment shall comply with 501.130(A)(1).

*Exception: Where portable lighting equipment is mounted on movable stands and is connected by flexible cords, as covered in 501.140, it shall be permitted, where mounted in any position, if it conforms to 501.130(B)(2).*

**(5) Switches.** Switches that are a part of an assembled fixture or of an individual lampholder shall comply with 501.115(B)(1).

**(6) Starting Equipment.** Starting and control equipment for electric-discharge lamps shall comply with 501.120(B).

Sections 501.130(A) and (B) specify the requirements for luminaires in Class I locations. Exhibit 501.20 shows a typical luminaire for Class I, Group C and D locations. The outlet boxes have an internally threaded opening designed to receive the cover. A pendant luminaire is attached to the cover by threaded rigid metal conduit or threaded intermediate metal conduit. To prevent loosening from vibration or lamp changing, threaded joints must be provided with set-screws. The set-screws should not interrupt the explosion-proof joint. Rigid metal conduit or intermediate metal conduit stems longer than 12 in. require effective bracing or a flexible fitting identified for the purpose, placed not more than 12 in. from the point of attachment to the supporting box, cover, or fitting.

A globe holder, available in sizes suitable for lamps from 40 watts through 500 watts, is threaded onto the body of the luminaire housing to support a heavy glass globe, guard, and reflector. In designing any hazardous location lighting system, operating temperatures must be considered. If the area is Class I, Division 1, luminaires that are identified for this location and are properly marked must be used. Generally, enclosed and gasketed luminaires (previously

**EXHIBIT 501.20** A typical luminaire for use in Class I, Group C and D locations. (Courtesy of Appleton Electric Co., EGS Electrical Group)

called vaportight luminaires) without guards, if breakage is unlikely, or luminaires identified for Class I, Division 2 locations are required in Division 2 locations.

Luminaires listed by Underwriters Laboratories Inc. for use in any Class I, either Division 1 or 2 locations, or both, are designed to operate without igniting surrounding flammable gas or vapor atmospheres and are marked with the operating temperature or temperature class, as shown in Table 500.8(C).

Portable luminaires are required to be specifically listed as a complete assembly for use in Class 1, Division 1 or 2 locations. Exhibit 501.21 shows an explosionproof hand lamp. Lamp compartments must be sealed from the terminal compartment. Provisions must be made for the connection of 3-conductor (one must be a grounding conductor) flexible, extra-hard-usage cord. See 501.140(A)(1).

*Exception: A thermal protector potted into a thermally protected fluorescent lamp ballast if the luminaire is identified for the location.*

### 501.135 Utilization Equipment

**(A) Class I, Division 1.** In Class I, Division 1 locations, all utilization equipment shall be identified for Class I, Division 1 locations.

**(B) Class I, Division 2.** In Class I, Division 2 locations, all utilization equipment shall comply with 501.135(B)(1) through (B)(3).

**EXHIBIT 501.21** An explosionproof hand lamp for use in Class I locations. (Courtesy of Appleton Electric Co., EGS Electrical Group)

**(1) Heaters.** Electrically heated utilization equipment shall conform with either item (1) or item (2):

- (1) The heater shall not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved on any surface that is exposed to the gas or vapor when continuously energized at the maximum rated ambient temperature. If a temperature controller is not provided, these conditions shall apply when the heater is operated at 120 percent of rated voltage.

*Exception No. 1: For motor-mounted anticondensation space heaters, see 501.125.*

*Exception No. 2: Where a current-limiting device is applied to the circuit serving the heater to limit the current in the heater to a value less than that required to raise the heater surface temperature to 80 percent of the ignition temperature.*

- (2) The heater shall be identified for Class I, Division 1 locations.

*Exception to (2): Electrical resistance heat tracing identified for Class I, Division 2 locations.*

**(2) Motors.** Motors of motor-driven utilization equipment shall comply with 501.125(B).

**(3) Switches, Circuit Breakers, and Fuses.** Switches, circuit breakers, and fuses shall comply with 501.115(B).

The requirements for utilization equipment in Class I locations are virtually identical for both Division 1 and 2 locations, except for heaters. Electric pipe heat-tracing systems listed for Class I, Division 2 locations and complying with the exception to 501.135(B)(1)(2) are available.

### 501.140 Flexible Cords, Class I, Divisions 1 and 2

**(A) Permitted Uses.** Flexible cord shall be permitted:

- (1) For connection between portable lighting equipment or other portable utilization equipment and the fixed portion of their supply circuit.
- (2) For that portion of the circuit where the fixed wiring methods of 501.10(A) cannot provide the necessary degree of movement for fixed and mobile electrical utilization equipment, and the flexible cord is protected by location or by a suitable guard from damage and only in an industrial establishment where conditions of maintenance and engineering supervision ensure that only qualified persons install and service the installation.
- (3) For electric submersible pumps with means for removal without entering the wet-pit. The extension of the flexible cord within a suitable raceway between the wet-pit and the power source shall be permitted.
- (4) For electric mixers intended for travel into and out of open-type mixing tanks or vats.

Section 501.140(A)(3) recognizes a wet-pit type of installation that is finding increasing acceptance for use in wastewater systems. See the commentary following 501.125(A)(4) for more information on motors installed in wet pits.

Due to the operating conditions associated with electric mixers used in mixing tanks, the mixers are considered portable utilization equipment and may be wired with flexible cord per 501.140(A)(4).

- (5) For temporary portable assemblies consisting of receptacles, switches, and other devices that are not considered portable utilization equipment but are individually listed for the location.

Temporary portable assemblies are assembled from receptacles, switches, and other devices that are suitable for Class I locations; the assemblies are not utilization equipment as defined in Article 100. These portable assemblies are permitted to utilize flexible cord. An example of such an assembly is a power cart that provides power during servicing or maintenance. In accordance with 501.140(B)(5) the flexible cord is required to be continuous from the power source to the assembly and from the assembly to the utilization equipment.

**(B) Installation.** Where flexible cords are used, the cords shall comply with all of the following:

- (1) Be of a type listed for extra-hard usage
- (2) Contain, in addition to the conductors of the circuit, an equipment grounding conductor complying with 400.23
- (3) Be supported by clamps or by other suitable means in such a manner that there is no tension on the terminal connections
- (4) In Division 1 locations or in Division 2 locations where the boxes, fittings, or enclosures are required to be explosionproof, the cord shall be terminated with a cord connector or attachment plug listed for the location or a cord connector installed with a seal listed for the location. In Division 2 locations where explosionproof equipment is not required, the cord shall be terminated with a listed cord connector or listed attachment plug.
- (5) Be of continuous length. Where 501.140(A)(5) is applied, cords shall be of continuous length from the power source to the temporary portable assembly and from the temporary portable assembly to the utilization equipment.

Informational Note: See 501.20 for flexible cords exposed to liquids having a deleterious effect on the conductor insulation.

### 501.145 Receptacles and Attachment Plugs, Class I, Divisions 1 and 2

Receptacles and attachment plugs shall be of the type providing for connection to the equipment grounding conductor of a flexible cord and shall be identified for the location.

*Exception: As provided in 501.105(B)(6).*

Exhibit 501.22 shows an explosionproof receptacle and attachment plug with an interlocking switch. The design of this device is such that when the switch is in the “on” position, the plug cannot be removed. Also, the switch cannot be placed in the “on” position when the plug has been removed; the receptacle is factory sealed, with a provision for threaded-conduit entry to the switch compartment. The plug is to be used with Type S or equivalent extra-hard-service flexible cord having an equipment grounding conductor.

Exhibit 501.23 shows a 30-ampere, 4-pole receptacle and attachment plug assembly that is suitable for use without a switch. The design is such that the mating parts of the receptacle and plug are enclosed in a chamber that seals the arc and, by delayed-action construction, prevents complete removal of the plug until the arc or hot metal has cooled.

**EXHIBIT 501.22** A receptacle and attachment plug of the explosionproof type with an interlocking switch. The switch must be in the “off” position before the attachment plug can be inserted or removed. (Courtesy of Appleton Electric Co., EGS Electrical Group)

**EXHIBIT 501.23** A 4-pole (delayed action) explosionproof receptacle and attachment plug suitable for use without a switch. (Courtesy of Appleton Electric Co., EGS Electrical Group)

The receptacle is factory sealed, and the attachment plug is designed for use with a 4-conductor cord (3-conductor, 3-phase circuit with one equipment grounding conductor) or a 3-conductor cord (two circuit conductors and one equipment grounding conductor).

### 501.150 Signaling, Alarm, Remote-Control, and Communications Systems

**(A) Class I, Division 1.** In Class I, Division 1 locations, all apparatus and equipment of signaling, alarm, remote-control, and communications systems, regardless of voltage, shall be identified for Class I, Division 1 locations, and all wiring shall comply with 501.10(A), 501.15(A), and 501.15(C).

**(B) Class I, Division 2.** In Class I, Division 2 locations, signaling, alarm, remote-control, and communications systems shall comply with 501.150(B)(1) through (B)(4).

**(1) Contacts.** Switches, circuit breakers, and make-and-break contacts of pushbuttons, relays, alarm bells, and horns shall have enclosures identified for Class I, Division 1 locations in accordance with 501.105(A).

*Exception: General-purpose enclosures shall be permitted if current-interrupting contacts are one of the following:*

- (1) Immersed in oil
- (2) Enclosed within a chamber hermetically sealed against the entrance of gases or vapors
- (3) In nonincendive circuits
- (4) Part of a listed nonincendive component

Explosionproof devices or explosionproof enclosures may prove more practical than oil-immersed contacts because maintaining the condition and level of the oil can be a problem. Hermetically sealed enclosures, such as float-operated mercury-tube switches, are available for some applications.

See the commentary regarding arcing contacts and the use of general-purpose enclosures in Class I, Division 2 locations following the exception to 501.105(B)(1).

**(2) Resistors and Similar Equipment.** Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with 501.105(B)(2).

**(3) Protectors.** Enclosures shall be provided for lightning protective devices and for fuses. Such enclosures shall be permitted to be of the general-purpose type.

**(4) Wiring and Sealing.** All wiring shall comply with 501.10(B), 501.15(B), and 501.15(C).

Audible signaling devices, such as bells, sirens, and horns, other than electronic types, usually involve make-and-break contacts that are capable of producing a spark of sufficient energy to cause ignition of a hazardous atmospheric mixture. Therefore, if used in Class I locations, this type of equipment, as shown in Exhibit 501.24, must be contained in explosionproof or purged and pressurized enclosures, wiring methods must comply with 501.10, and sealing fittings must be provided in accordance with 501.15. Electronic signal devices without make-and-break contacts usually do not require explosionproof enclosures in Division 2 locations.

**EXHIBIT 501.24** An audible signaling device for use in hazardous locations. (Courtesy of Cooper Crouse-Hinds)

### I. General

#### 502.1 Scope

Article 502 covers the requirements for electrical and electronic equipment and wiring for all voltages in Class II, Division 1 and 2 locations where fire or explosion hazards may exist due to combustible dust.

Class II, Division 1 and 2 locations are defined in 500.5(C) as “hazardous because of the presence of combustible dust.” These locations are separated into three groups: Group E, Group F, and Group G [see 500.6(B)]. Two different types of dust environments typically warrant a Class II, Division 1 area classification. The first is where a cloud of combustible dust is likely to be present continuously or intermittently under normal operating conditions or as a result of repair or maintenance operations or leakage. The other environment is one in which a dust layer is likely to accumulate to a depth greater than  $\frac{1}{8}$  in. on major horizontal surfaces over a defined period of time, generally 24 hours. A Class II, Division 2 location is typically one where these conditions exist infrequently or under abnormal conditions.

The size of the dust particle is the primary factor in determining whether it should be classified as combustible. Combustible dust, as defined in NFPA 499, *Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*, is any finely divided solid material 420 microns (0.017 in.) or smaller in diameter (material passing through a U.S. No. 40 standard sieve) that presents a fire or explosion hazard when dispersed and ignited in air.

One or more of the following four hazards may be present in a Class II location:

1. An explosive mixture of air and dust in suspension
2. Accumulation of dust that acts as a thermal blanket and interferes with the safe dissipation of heat from electrical equipment
3. Accumulation of electrically conductive dust lodged between terminals that have a difference of potential, thereby causing tracking and glowing hot particles, short circuits, or ground faults that may ignite dust accumulated in the vicinity
4. Deposits of dust that could be ignited by arcs or sparks

### 502.5 Explosionproof Equipment

Explosionproof equipment and wiring shall not be required and shall not be acceptable in Class II locations unless also identified for such locations.

The electrical equipment required in Class II locations is different from that required for Class I locations. Class II equipment is designed to prevent the ignition of layers of dust, which may cause an increase in equipment operating temperature, while Class I equipment does not address this concern. To protect against explosions in hazardous locations, all electrical equipment exposed to the hazardous atmosphere must be suitable for such locations. Equipment suitable for one class and group is not necessarily suitable for any other class and group.

Class I equipment is not necessarily suitable for a Class II location because the hazard contemplated in the equipment design is different. Grain dust, for example, ignites at a temperature lower than that of most flammable vapors. Motors listed for use in Class I locations may not have dust shields on the bearings to prevent entrance of dust into the bearing race, thereby causing overheating of the bearing and resulting in ignition of dust on the motor. Class I equipment is not designed for dust layering unless it is also designed and identified for Class II locations.

Dust-ignitionproof enclosures are not required to be explosionproof. Explosionproof enclosures are not necessarily dust-ignitionproof; however, they are allowed to be used in

Class II locations if the equipment is dual rated and identified as suitable for the Class II division and group.

These dual-rated enclosures, where used in an environment that is only a Class II location, are not required to be sealed to complete the explosionproof assembly as required in a Class I environment. However, they must be provided with seals to prevent the entrance of dust into the enclosure where a raceway provides a means for dust to enter the system, such as in a conduit run between the enclosure and a general-purpose junction box.

### 502.6 Zone Equipment

Equipment listed and marked in accordance with 506.9(C)(2) for Zone 20 locations shall be permitted in Class II, Division 1 locations for the same dust atmosphere; and with a suitable temperature class.

Equipment listed and marked in accordance with 506.9(C)(2) for Zone 20, 21, or 22 locations shall be permitted in Class II, Division 2 locations for the same dust atmosphere and with a suitable temperature class.

## II. Wiring

### 502.10 Wiring Methods

Wiring methods shall comply with 502.10(A) or (B).

#### (A) Class II, Division 1.

(1) **General.** In Class II, Division 1 locations, the wiring methods in (1) through (4) shall be permitted:

- (1) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.
- (2) Type MI cable with termination fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.
- (3) In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable, listed for use in Class II, Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, a separate equipment grounding conductor(s) in accordance with 250.122, and provided with termination fittings listed for the application, shall be permitted.
- (4) Fittings and boxes shall be provided with threaded bosses for connection to conduit or cable terminations and shall be dusttight. Fittings and boxes in which taps, joints, or terminal connections are made, or that are used in Group E locations, shall be identified for Class II locations.

In Class II, Division 1 locations, boxes or fittings that do not enclose splices, taps, or terminations are required to be dust-tight, with threaded bosses for connection of conduit or cable connectors. Boxes or fittings — such as conduit L, T, or C fittings — that do contain splices, taps, or terminations or are intended for Group E locations must be identified for Class II locations, usually as the dust-ignitionproof or pressurized type.

**(2) Flexible Connections.** Where necessary to employ flexible connections, one or more of the following shall also be permitted:

- (1) Dusttight flexible connectors
- (2) Liquidtight flexible metal conduit with listed fittings
- (3) Liquidtight flexible nonmetallic conduit with listed fittings
- (4) Interlocked armor Type MC cable having an overall jacket of suitable polymeric material and provided with termination fittings listed for Class II, Division 1 locations.
- (5) Flexible cord listed for extra-hard usage and terminated with listed dusttight fittings. Where flexible cords are used, they shall comply with 502.140.

Informational Note: See 502.30(B) for grounding requirements where flexible conduit is used.

## **(B) Class II, Division 2.**

**(1) General.** In Class II, Division 2 locations, the following wiring methods shall be permitted:

- (1) All wiring methods permitted in 502.10(A).
- (2) Rigid metal conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways.
- (3) Type MC or MI cable with listed termination fittings.
- (4) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, including installation in cable tray systems. The cable shall be terminated with listed fittings.
- (5) Type ITC and Type ITC-ER cable as permitted in 727.4 and terminated with listed fittings.
- (6) Type MC, MI, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed.
- (7) In industrial establishments with restricted public access where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where metallic conduit does not provide sufficient corrosion resistance, reinforced thermosetting resin conduit (RTRC) factory elbows, and associated

fittings, all marked with suffix -XW, and Schedule 80 PVC conduit, factory elbows and associated fittings shall be permitted.

*Exception to (6): Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the spacings required by (6).*

**(2) Flexible Connections.** Where provision must be made for flexibility, 502.10(A)(2) shall apply.

Where it is necessary to use flexible connections, liquidtight flexible conduit or extra-hard-usage flexible cord is permitted. Where liquidtight flexible conduit is used, a bonding jumper (internal or external) must be provided around such conduit (see 502.30), and an additional conductor for grounding must be provided where flexible cord is used. Alternatively, another method is to use a flexible fitting as described in the commentary following 501.10(A)(2).

**(3) Nonincendive Field Wiring.** Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit, provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.

Informational Note: Simple apparatus is defined in 504.2.

Separate nonincendive field wiring circuits shall be installed in accordance with one of the following:

- (1) In separate cables
- (2) In multiconductor cables where the conductors of each circuit are within a grounded metal shield
- (3) In multiconductor cables or in raceways where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.)

**(4) Boxes and Fittings.** All boxes and fittings shall be dusttight.

Boxes and fittings in a Class II, Division 2 location need only be dusttight. Whereas, in Division 1 locations, boxes containing taps, joints, or terminal connections in addition to being dusttight, must be provided with threaded hubs, as shown in Exhibit 502.1, and must be identified for use in Class II locations. Threaded hubs also provide adequate bonding in Division 2 locations. Exhibit 502.1 also shows a dusttight cover, which is necessary for Class II locations.

**EXHIBIT 502.1** Junction box with threaded hubs, suitable for use in Class II, Group E hazardous atmospheres. (Courtesy of Appleton Electric Co., EGS Electrical Group)

### 502.15 Sealing, Class II, Divisions 1 and 2

Where a raceway provides communication between an enclosure that is required to be dust-ignitionproof and one that is not, suitable means shall be provided to prevent the entrance of dust into the dust-ignitionproof enclosure through the raceway. One of the following means shall be permitted:

- (1) A permanent and effective seal
- (2) A horizontal raceway not less than 3.05 m (10 ft) long
- (3) A vertical raceway not less than 1.5 m (5 ft) long and extending downward from the dust-ignitionproof enclosure
- (4) A raceway installed in a manner equivalent to (2) or (3) that extends only horizontally and downward from the dust-ignition proof enclosures

Where a raceway provides communication between an enclosure that is required to be dust-ignitionproof and an enclosure in an unclassified location, seals shall not be required.

Sealing fittings shall be accessible.

Seals shall not be required to be explosionproof.

Informational Note: Electrical sealing putty is a method of sealing.

Four suitable ways are provided to prevent dust from entering dust-ignitionproof enclosures through the raceway: (1) a permanent seal in the raceway, (2) a horizontal separation

between enclosures of not less than 10 ft, (3) a vertical separation between enclosures of not less than 5 ft in a raceway extending downward from a dust-ignitionproof enclosure, or (4) a raceway extending from the bottom or side of an enclosure that provides the equivalent raceway length to that covered in (2) and (3). Sealing methods (1) through (3) in Class II locations are shown in Exhibit 502.2.

**EXHIBIT 502.2** Three methods for preventing dust from entering a dust-ignitionproof enclosure through the raceway.

The requirement to provide a seal applies if a raceway connects two enclosures in a hazardous location — one enclosure that is required to be dust-ignitionproof to one that is not required to be dust-ignitionproof. If a raceway extends from a dust-ignitionproof enclosure to an enclosure in an unclassified location, a seal in that raceway is not required. Sealing fittings designed for use in Class I locations are acceptable. However, because the Class I location pressure-piling considerations are not inherent to Class II locations, conduit seals are not required to be explosionproof. Conduit seals are expected only to prevent the migration of dust into dust-ignitionproof enclosures. No sealing method is needed in the special, but not unusual, situation in which dust cannot enter the raceway in the hazardous location.

### 502.25 Uninsulated Exposed Parts, Class II, Divisions 1 and 2

There shall be no uninsulated exposed parts, such as electrical conductors, buses, terminals, or components, that operate at more than 30 volts (15 volts in wet locations). These parts shall additionally be protected by a protection technique according to 500.7(E), (F), or (G) that is suitable for the location.

### 502.30 Grounding and Bonding, Class II, Divisions 1 and 2

Wiring and equipment in Class II, Division 1 and 2 locations shall be grounded as specified in Article 250 and in accordance with the requirements of 502.30(A) and (B).

**(A) Bonding.** The locknut-bushing and double-locknut types of contact shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, and so forth, between Class II locations and the point of grounding for service equipment or point of grounding of a separately derived system.

The requirements for enhanced bonding in Class II locations are the same as those given in 501.30(A) for Class I locations. For further information, see the commentary following that section. Also see 250.100 for additional requirements applying to bonding in hazardous locations.

In Class II locations, a raceway connected to an enclosure via a double locknut connection or a single locknut and bushing connection is not an acceptable method of bonding. Bonding jumpers or other approved means with proper fittings are required for the interconnection of all raceways, junction boxes, fittings, enclosures, and so on, installed between the hazardous area and the grounding electrode conductor connection point at the service equipment, the grounding electrode connection at a feeder or branch-circuit disconnecting means at separate buildings, or the grounding electrode connection to the source of a separately derived system.

*Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode conductor are connected together on the line side of the building or structure disconnecting means as specified in 250.32(B) if the branch-circuit overcurrent protection is located on the load side of the disconnecting means.*

Informational Note: See 250.100 for additional bonding requirements in hazardous (classified) locations.

**(B) Types of Equipment Grounding Conductors.** Liquidtight flexible metal conduit shall include an equipment bonding jumper of the wire type in compliance with 250.102.

*Exception: In Class II, Division 2 locations, the bonding jumper shall be permitted to be deleted where all of the following conditions are met:*

- (1) *Listed liquidtight flexible metal conduit 1.8 m (6 ft) or less in length, with fittings listed for grounding, is used.*
- (2) *Overcurrent protection in the circuit is limited to 10 amperes or less.*
- (3) *The load is not a power utilization load.*

If installed outside the raceway or enclosure, the grounding conductor must not exceed 6 ft and must be routed with the raceway or enclosure. See 250.102(E) for equipment bonding jumper installation requirements.

### 502.35 Surge Protection — Class II, Divisions 1 and 2

Surge arresters and surge-protective devices installed in a Class II, Division 1 location shall be in suitable enclosures. Surge-protective capacitors shall be of a type designed for specific duty.

### 502.40 Multiwire Branch Circuits

In a Class II, Division 1 location, a multiwire branch circuit shall not be permitted.

*Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.*

## III. Equipment

In the layout of electrical installations for hazardous locations, it is preferable to locate service equipment, switchboards, panelboards, and much of the electrical equipment in less hazardous areas, usually in a separate room. The use of pressurized rooms, as described in NFPA 496, *Standard for Purged and Pressurized Enclosures for Electrical Equipment*, is a common method of protecting panelboards and switchboards in grain elevators and similar locations.

### 502.100 Transformers and Capacitors

**(A) Class II, Division 1.** In Class II, Division 1 locations, transformers and capacitors shall comply with 502.100(A) (1) through (A)(3).

**(1) Containing Liquid That Will Burn.** Transformers and capacitors containing a liquid that will burn shall be installed only in vaults complying with 450.41 through 450.48, and, in addition, (1), (2), and (3) shall apply.

(1) Doors or other openings communicating with the Division 1 location shall have self-closing fire doors on both sides of the wall, and the doors shall be carefully fitted and provided with suitable seals (such as weather stripping) to minimize the entrance of dust into the vault.

- (2) Vent openings and ducts shall communicate only with the outside air.
- (3) Suitable pressure-relief openings communicating with the outside air shall be provided.

**(2) Not Containing Liquid That Will Burn.** Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with 450.41 through 450.48 or be identified as a complete assembly, including terminal connections.

**(3) Group E.** No transformer or capacitor shall be installed in a Class II, Division 1, Group E location.

**(B) Class II, Division 2.** In Class II, Division 2 locations, transformers and capacitors shall comply with 502.100(B)(1) through (B)(3).

**(1) Containing Liquid That Will Burn.** Transformers and capacitors containing a liquid that will burn shall be installed in vaults that comply with 450.41 through 450.48.

**(2) Containing Askarel.** Transformers containing askarel and rated in excess of 25 kVA shall be as follows:

- (1) Provided with pressure-relief vents
- (2) Provided with a means for absorbing any gases generated by arcing inside the case, or the pressure-relief vents shall be connected to a chimney or flue that will carry such gases outside the building
- (3) Have an airspace of not less than 150 mm (6 in.) between the transformer cases and any adjacent combustible material

**(3) Dry-Type Transformers.** Dry-type transformers shall be installed in vaults or shall have their windings and terminal connections enclosed in tight metal housings without ventilating or other openings and shall operate at not over 600 volts, nominal.

Capacitors used for power-factor correction of individual motors are of sealed construction, but if installed in Class II, Division 1 locations, they must also be identified as a complete assembly, including dusttight terminal enclosures. The only special requirement for capacitors in Division 2 locations is that they not contain oil or any other liquid that burns; otherwise, they are to be installed in vaults.

Where it is necessary to install a transformer, small, low-voltage, dusttight (without ventilating openings) dry-type transformers may be an option, but transformers that have a primary voltage rating of over 600 volts must be either less flammable liquid-insulated or installed in a vault. In almost all cases, transformers can be remotely located from dust atmospheres.

### 502.115 Switches, Circuit Breakers, Motor Controllers, and Fuses

**(A) Class II, Division 1.** In Class II, Division 1 locations, switches, circuit breakers, motor controllers, fuses, push buttons, relays, and similar devices shall be provided with enclosures identified for the location.

**(B) Class II, Division 2.** In Class II, Division 2 locations, enclosures for fuses, switches, circuit breakers, and motor controllers, including push buttons, relays, and similar devices, shall be dusttight or otherwise identified for the location.

Exhibits 502.3 and 502.4 show dust-ignitionproof equipment that is suitable for use in Class II, Division 1 locations. Dust-ignitionproof equipment enclosures can be used in Class II, Division 2 locations, but because of the reduced level of hazard associated with Division 2, dusttight equipment enclosures are also permitted. In addition to being suitable for Class II and the specific division, these types of equipment must also be suitable for the dust group(s) (i.e., Groups E, F, and G) present in a specific hazardous location.

**EXHIBIT 502.3** A dust-ignitionproof pushbutton control station suitable for use in Class II, Group E, F, and G locations. (Courtesy of Appleton Electric Co., EGS Electrical Group)

### 502.120 Control Transformers and Resistors

**(A) Class II, Division 1.** In Class II, Division 1 locations, control transformers, solenoids, impedance coils, resistors, and any overcurrent devices or switching mechanisms associated with them shall be provided with enclosures identified for the location.

**EXHIBIT 502.4** A dust-ignitionproof panelboard for use in Class II, Division 2, Group F and G locations. (Courtesy of Cooper Crouse-Hinds)

Heat-generating and switching equipment must have enclosures identified specifically for use in Class II, Division 1 environments.

**(B) Class II, Division 2.** In Class II, Division 2 locations, transformers and resistors shall comply with 502.120(B)(1) through (B)(3).

**(1) Switching Mechanisms.** Switching mechanisms (including overcurrent devices) associated with control transformers, solenoids, impedance coils, and resistors shall be provided with enclosures that are dusttight or otherwise identified for the location.

**(2) Coils and Windings.** Where not located in the same enclosure with switching mechanisms, control transformers, solenoids, and impedance coils shall be provided with enclosures that are dusttight or otherwise identified for the location.

**(3) Resistors.** Resistors and resistance devices shall have dust-ignitionproof enclosures that are dusttight or otherwise identified for the location.

### 502.125 Motors and Generators

**(A) Class II, Division 1.** In Class II, Division 1 locations, motors, generators, and other rotating electrical machinery shall be in conformance with either of the following:

- (1) Identified for the location
- (2) Totally enclosed pipe-ventilated, meeting temperature limitations in 502.5

The phrase “other rotating electrical machinery” includes electric brakes. Listed and labeled electrical brakes are available for Class II, Group E, F, and G locations. Markings on the motor must indicate that it has been identified for Class II, Division 1 locations, or a totally enclosed pipe-ventilated installation is required. If control wiring to the motor is necessary according to the motor installation instructions, the control circuit must be installed and connected properly. Most motors for Class II locations require internal thermal protection to comply with the temperature limitations in 500.8(D)(2). Integral horsepower Class II motors may require both power and control circuit wiring from the motor controller to the motor.

**(B) Class II, Division 2.** In Class II, Division 2 locations, motors, generators, and other rotating electrical equipment shall be totally enclosed nonventilated, totally enclosed pipe-ventilated, totally enclosed water-air-cooled, totally enclosed fan-cooled or dust-ignitionproof for which maximum full-load external temperature shall be in accordance with 500.8(D)(2) for normal operation when operating in free air (not dust blanketed) and shall have no external openings.

*Exception: If the authority having jurisdiction believes accumulations of nonconductive, nonabrasive dust will be moderate and if machines can be easily reached for routine cleaning and maintenance, the following shall be permitted to be installed:*

- (1) Standard open-type machines without sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices
- (2) Standard open-type machines with such contacts, switching mechanisms, or resistance devices enclosed within dusttight housings without ventilating or other openings
- (3) Self-cleaning textile motors of the squirrel-cage type

All types of totally enclosed motors are permitted in Class II, Division 2 locations if the external surface temperatures, without a dust blanket, do not exceed the temperatures indicated under the maximum full-load (normal operation) conditions in 500.8(D)(2). Totally enclosed fan-cooled (TEFC) motors should be examined carefully to be sure there are no external openings, even though the motor may be marked TEFC.

### 502.128 Ventilating Piping

Ventilating pipes for motors, generators, or other rotating electrical machinery, or for enclosures for electrical equipment, shall be of metal not less than 0.53 mm (0.021 in.) in thickness or of equally substantial noncombustible material and shall comply with all of the following:

- (1) Lead directly to a source of clean air outside of buildings
- (2) Be screened at the outer ends to prevent the entrance of small animals or birds
- (3) Be protected against physical damage and against rusting or other corrosive influences

Ventilating pipes shall also comply with 502.128(A) and (B).

**(A) Class II, Division 1.** In Class II, Division 1 locations, ventilating pipes, including their connections to motors or to the dust-ignitionproof enclosures for other equipment, shall be dusttight throughout their length. For metal pipes, seams and joints shall comply with one of the following:

- (1) Be riveted and soldered
- (2) Be bolted and soldered
- (3) Be welded
- (4) Be rendered dusttight by some other equally effective means

**(B) Class II, Division 2.** In Class II, Division 2 locations, ventilating pipes and their connections shall be sufficiently tight to prevent the entrance of appreciable quantities of dust into the ventilated equipment or enclosure and to prevent the escape of sparks, flame, or burning material that might ignite dust accumulations or combustible material in the vicinity. For metal pipes, lock seams and riveted or welded joints shall be permitted; and tight-fitting slip joints shall be permitted where some flexibility is necessary, as at connections to motors.

### 502.130 Luminaires

**(A) Class II, Division 1.** In Class II, Division 1 locations, luminaires for fixed and portable lighting shall comply with 502.130(A)(1) through (A)(4).

**(1) Luminaires.** Each luminaire shall be identified for the location and shall be clearly marked to indicate the maximum wattage of the lamp for which it is designed.

**(2) Physical Damage.** Each luminaire shall be protected against physical damage by a suitable guard or by location.

**(3) Pendant Luminaires.** Pendant luminaires shall be suspended by threaded rigid metal conduit stems, by threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 300 mm (12 in.), permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm (12 in.) above the lower end of the stem, or flexibility in the form of a fitting or a flexible connector listed for the location shall be provided not more than 300 mm (12 in.) from the point of attachment to the supporting box or fitting. Threaded joints shall be provided with set screws or other effective means to prevent loosening. Where wiring between an outlet box or fitting and a pendant luminaire is not enclosed in conduit, flexible cord listed for hard usage shall be permitted to be used in accordance with 502.10(A)(2)(5). Flexible cord shall not serve as the supporting means for a luminaire.

**(4) Supports.** Boxes, box assemblies, or fittings used for the support of luminaires shall be identified for Class II locations.

**(B) Class II, Division 2.** In Class II, Division 2 locations, luminaires shall comply with 502.130(B)(1) through (B)(5).

**(1) Portable Lighting Equipment.** Portable lighting equipment shall be identified for the location. They shall be clearly marked to indicate the maximum wattage of lamps for which they are designed.

**(2) Fixed Lighting.** Luminaires for fixed lighting shall be provided with enclosures that are dusttight or otherwise identified for the location. Each luminaire shall be clearly marked to indicate the maximum wattage of the lamp that shall be permitted without exceeding an exposed surface temperature in accordance with 500.8(D)(2) under normal conditions of use.

**(3) Physical Damage.** Luminaires for fixed lighting shall be protected from physical damage by suitable guards or by location.

**(4) Pendant Luminaires.** Pendant luminaires shall be suspended by threaded rigid metal conduit stems, by threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems

longer than 300 mm (12 in.), permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm (12 in.) above the lower end of the stem, or flexibility in the form of an identified fitting or a flexible connector shall be provided not more than 300 mm (12 in.) from the point of attachment to the supporting box or fitting. Where wiring between an outlet box or fitting and a pendant luminaire is not enclosed in conduit, flexible cord listed for hard usage shall be permitted if terminated with a listed cord connector that maintains the protection technique. Flexible cord shall not serve as the supporting means for a luminaire.

**(5) Electric-Discharge Lamps.** Starting and control equipment for electric-discharge lamps shall comply with the requirements of 502.120(B).

All lighting equipment in Class II, Division 1 locations and all portable lighting equipment in a Class II, Division 2 location must also be identified for such use. If not identified for use in a Class II location, all fixed lighting equipment in a Class II, Division 2 location must be dusttight.

The provisions of 502.130 require luminaires in Class II locations to be marked to indicate maximum lamp wattage. In addition, lamps must be guarded or protected by their location to prevent damage that could allow the escape of sparks or burning material.

Flexible cord of the hard-usage type is permitted with approved sealed connections for the wiring of chain-suspended or hook-and-eye-suspended luminaires. Flexible cords are not intended to be used as cord pendants or drop cords.

Exhibit 502.5 shows a listed luminaire suitable for use in Class II, Group E, F, and G locations. The portable hand lamp shown in Exhibit 501.21 is listed as a complete assembly for use in Class I locations and also in any Class II, Group F or G location.

### 502.135 Utilization Equipment

**(A) Class II, Division 1.** In Class II, Division 1 locations, all utilization equipment shall be identified for the location.

**(B) Class II, Division 2.** In Class II, Division 2 locations, all utilization equipment shall comply with 502.135(B)(1) through (B)(4).

**(1) Heaters.** Electrically heated utilization equipment shall be identified for the location.

*Exception: Metal-enclosed radiant heating panel equipment shall be permitted to be dusttight and marked in accordance with 500.8(C).*

**(2) Motors.** Motors of motor-driven utilization equipment shall comply with 502.125(B).

**EXHIBIT 502.5** A typical luminaire for use in Class II, Division 1 locations. (Courtesy of Cooper Crouse-Hinds)

**(3) Switches, Circuit Breakers, and Fuses.** Enclosures for switches, circuit breakers, and fuses shall comply with 502.115(B).

**(4) Transformers, Solenoids, Impedance Coils, and Resistors.** Transformers, solenoids, impedance coils, and resistors shall comply with 502.120(B).

### 502.140 Flexible Cords — Class II, Divisions 1 and 2

Flexible cords used in Class II locations shall comply with all of the following:

- (1) Be of a type listed for extra-hard usage

*Exception: Flexible cord listed for hard usage as permitted by 502.130(A)(3) and (B)(4).*

- (2) Contain, in addition to the conductors of the circuit, an equipment grounding conductor complying with 400.23

- (3) Be supported by clamps or by other suitable means in such a manner that there will be no tension on the terminal connections

- (4) In Division 1 locations, the cord shall be terminated with a cord connector listed for the location or a listed cord connector installed with a seal listed for the location. In Division 2 locations, the cord shall be terminated with a listed dusttight cord connector.

**502.145 Receptacles and Attachment Plugs**

**(A) Class II, Division 1.** In Class II, Division 1 locations, receptacles and attachment plugs shall be of the type providing for connection to the equipment grounding conductor of the flexible cord and shall be identified for Class II locations.

**(B) Class II, Division 2.** In Class II, Division 2 locations, receptacles and attachment plugs shall be of the type that provides for connection to the equipment grounding conductor of the flexible cord and shall be designed so that connection to the supply circuit cannot be made or broken while live parts are exposed.

**502.150 Signaling, Alarm, Remote-Control, and Communications Systems; and Meters, Instruments, and Relays**

Informational Note: See Article 800 for rules governing the installation of communications circuits.

**(A) Class II, Division 1.** In Class II, Division 1 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with 502.150(A)(1) through (A)(3).

**(1) Contacts.** Switches, circuit breakers, relays, contactors, fuses and current-breaking contacts for bells, horns, howlers, sirens, and other devices in which sparks or arcs may be produced shall be provided with enclosures identified for the location.

*Exception: Where current-breaking contacts are immersed in oil or where the interruption of current occurs within a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.*

**(2) Resistors and Similar Equipment.** Resistors, transformers, choke coils, rectifiers, thermionic tubes, and other heat-generating equipment shall be provided with enclosures identified for the location.

*Exception: Where resistors or similar equipment are immersed in oil or enclosed in a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.*

**(3) Rotating Machinery.** Motors, generators, and other rotating electrical machinery shall comply with 502.125(A).

**(B) Class II, Division 2.** In Class II, Division 2 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with 502.150(B)(1) through (B)(4).

**(1) Contacts.** Contacts shall comply with 502.150(A)(1) or shall be installed in enclosures that are dusttight or otherwise identified for the location.

*Exception: In nonincendive circuits, enclosures shall be permitted to be of the general-purpose type.*

**(2) Transformers and Similar Equipment.** The windings and terminal connections of transformers, choke coils, and similar equipment shall comply with 502.120(B)(2).

**(3) Resistors and Similar Equipment.** Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with 502.120(B)(3).

**(4) Rotating Machinery.** Motors, generators, and other rotating electrical machinery shall comply with 502.125(B).

## I. General

### 503.1 Scope

Article 503 covers the requirements for electrical and electronic equipment and wiring for all voltages in Class III, Division 1 and 2 locations where fire or explosion hazards may exist due to ignitable fibers/flyings.

Class III locations usually include textile mills that process cotton, rayon, and so on, where easily ignitable fibers/flyings are present in the manufacturing process. Sawmills and other woodworking plants, where sawdust, wood shavings, and combustible fibers/flyings are present, may also become hazardous. If wood flour (dust) is also present, the location is a Class II, Group G location, not a Class III location.

Fibers/flyings are hazardous not only because they are easily ignited, but also because flames spread through them quickly. Such fires travel with a rapidity approaching an explosion and are commonly called flash fires.

Class III, Division 1 applies to locations where material is handled, manufactured, or used. Division 2 applies to locations where material is stored or handled but where no manufacturing processes are performed. Unlike Class I locations (Groups A, B, C, and D) and Class II locations (Groups E, F, and G), there are no material group designations in Class III locations.

### 503.5 General

Equipment installed in Class III locations shall be able to function at full rating without developing surface temperatures high enough to cause excessive dehydration or gradual carbonization of accumulated fibers/flyings. Organic material that is carbonized or excessively dry is highly susceptible to spontaneous ignition. The maximum surface temperatures under operating conditions shall not exceed 165°C (329°F) for equipment that is not subject to overloading, and 120°C (248°F) for equipment (such as motors or power transformers) that may be overloaded.

*Informational Note:* For electric trucks, see NFPA 505-2011, *Fire Safety Standard for Powered Industrial Trucks Including Type Designations, Areas of Use, Conversions, Maintenance, and Operation*.

### 503.6 Zone Equipment

Equipment listed and marked in accordance with 506.9(C)(2) for Zone 20 locations and with a temperature class of not greater than T120°C (for equipment that may be overloaded) or not greater than T165°C (for equipment not subject to overloading) shall be permitted in Class III, Division 1 locations.

Equipment listed and marked in accordance with 506.9(C)(2) for Zone 20, 21, or 22 locations and with a temperature class of not greater than T120°C (for equipment that may be overloaded) or not greater than T165°C (for equipment not subject to overloading) shall be permitted in Class III, Division 2 locations.

## II. Wiring

### 503.10 Wiring Methods

Wiring methods shall comply with 503.10(A) or (B).

#### (A) Class III, Division 1.

**(1) General.** In Class III, Division 1 locations, the wiring method shall be in accordance with (1) through (4):

- (1) Rigid metal conduit, Type PVC conduit, Type RTRC conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways, or Type MC or MI cable with listed termination fittings.
- (2) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725 including installation in cable tray systems. The cable shall be terminated with listed fittings.
- (3) Type ITC and Type ITC-ER cable as permitted in 727.4 and terminated with listed fittings.
- (4) Type MC, MI, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed.

*Exception to (4): Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the spacings required by 503.10(A)(1)(4).*

**(2) Boxes and Fittings.** All boxes and fittings shall be dusttight.

**(3) Flexible Connections.** Where necessary to employ flexible connections, one or more of the following shall be permitted:

- (1) Dusttight flexible connectors
- (2) Liquidtight flexible metal conduit with listed fittings,
- (3) Liquidtight flexible nonmetallic conduit with listed fittings,
- (4) Interlocked armor Type MC cable having an overall jacket of suitable polymeric material and installed with listed dusttight termination fittings
- (5) Flexible cord in compliance with 503.140

Informational Note: See 503.30(B) for grounding requirements where flexible conduit is used.

**(4) Nonincendive Field Wiring.** Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit, provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.

Informational Note: Simple apparatus is defined in 504.2.

Separate nonincendive field wiring circuits shall be installed in accordance with one of the following:

- (1) In separate cables
- (2) In multiconductor cables where the conductors of each circuit are within a grounded metal shield
- (3) In multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.)

Nonincendive field wiring is permitted in Class III, Division 1 locations. Except as permitted in 503.10(B) Exception, the wiring methods used for Class III, Division 2 locations are identical to those required for Division 1 locations.

**(B) Class III, Division 2.** In Class III, Division 2 locations, the wiring method shall comply with 503.10(A).

*Exception: In sections, compartments, or areas used solely for storage and containing no machinery, open wiring on insulators shall be permitted where installed in accordance*

*with Article 398, but only on condition that protection as required by 398.15(C) be provided where conductors are not run in roof spaces and are well out of reach of sources of physical damage.*

### 503.25 Uninsulated Exposed Parts, Class III, Divisions 1 and 2

There shall be no uninsulated exposed parts, such as electrical conductors, buses, terminals, or components, that operate at more than 30 volts (15 volts in wet locations). These parts shall additionally be protected by a protection technique according to 500.7(E), (F), or (G) that is suitable for the location.

*Exception: As provided in 503.155.*

Exposed live parts are permitted in Class III, Division 1 and 2 locations provided the voltage does not exceed 30 volts in dry locations or 15 volts in wet locations. Protection techniques permitted for these parts are intrinsically safe or non-incendive.

However, caution must be observed in working around uninsulated exposed parts because tools or other conductive items that come in contact with the circuit could produce sparks and be a source of ignition in a hazardous location.

### 503.30 Grounding and Bonding — Class III, Divisions 1 and 2

Wiring and equipment in Class III, Division 1 and 2 locations shall be grounded as specified in Article 250 and with the following additional requirements in 503.30(A) and (B).

**(A) Bonding.** The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, and so forth, between Class III locations and the point of grounding for service equipment or point of grounding of a separately derived system.

The requirements for enhanced bonding in Class III locations are the same as those for Class I locations given in 501.30(A) and for Class II locations in 502.30(A). For further information, see the commentary following 501.30(A). Also see 250.100 for additional bonding requirements applying in hazardous locations.

*Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode conductor are connected*

together on the line side of the building or structure disconnecting means as specified in 250.32(B) if the branch-circuit overcurrent protection is located on the load side of the disconnecting means.

Informational Note: See 250.100 for additional bonding requirements in hazardous (classified) locations.

**(B) Types of Equipment Grounding Conductors.** Liquidtight flexible metal conduit shall include an equipment bonding jumper of the wire type in compliance with 250.102.

*Exception: In Class III, Division 1 and 2 locations, the bonding jumper shall be permitted to be deleted where all of the following conditions are met:*

- (1) Listed liquidtight flexible metal 1.8 m (6 ft) or less in length, with fittings listed for grounding, is used.
- (2) Overcurrent protection in the circuit is limited to 10 amperes or less.
- (3) The load is not a power utilization load.

### III. Equipment

#### 503.100 Transformers and Capacitors — Class III, Divisions 1 and 2

Transformers and capacitors shall comply with 502.100(B).

#### 503.115 Switches, Circuit Breakers, Motor Controllers, and Fuses — Class III, Divisions 1 and 2

Switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices, shall be provided with dusttight enclosures.

#### 503.120 Control Transformers and Resistors — Class III, Divisions 1 and 2

Transformers, impedance coils, and resistors used as, or in conjunction with, control equipment for motors, generators, and appliances shall be provided with dusttight enclosures complying with the temperature limitations in 503.5.

#### 503.125 Motors and Generators — Class III, Divisions 1 and 2

In Class III, Divisions 1 and 2 locations, motors, generators, and other rotating machinery shall be totally enclosed non-ventilated, totally enclosed pipe ventilated, or totally enclosed fan cooled.

*Exception: In locations where, in the judgment of the authority having jurisdiction, only moderate accumulations of lint or flyings are likely to collect on, in, or in the vicinity of a rotating electrical machine and where such machine is*

*readily accessible for routine cleaning and maintenance, one of the following shall be permitted:*

- (1) Self-cleaning textile motors of the squirrel-cage type
- (2) Standard open-type machines without sliding contacts, centrifugal or other types of switching mechanisms, including motor overload devices
- (3) Standard open-type machines having such contacts, switching mechanisms, or resistance devices enclosed within tight housings without ventilating or other openings

The phrase “other rotating machinery” in 503.125 includes electric brakes. Listed and labeled electric brakes are available for Class II, Group G locations, and, according to the UL *Hazardous Location Equipment Directory*, these brakes are suitable for Class III locations.

#### 503.128 Ventilating Piping — Class III, Divisions 1 and 2

Ventilating pipes for motors, generators, or other rotating electrical machinery, or for enclosures for electric equipment, shall be of metal not less than 0.53 mm (0.021 in.) in thickness, or of equally substantial noncombustible material, and shall comply with the following:

- (1) Lead directly to a source of clean air outside of buildings
- (2) Be screened at the outer ends to prevent the entrance of small animals or birds
- (3) Be protected against physical damage and against rusting or other corrosive influences

Ventilating pipes shall be sufficiently tight, including their connections, to prevent the entrance of appreciable quantities of fibers/flyings into the ventilated equipment or enclosure and to prevent the escape of sparks, flame, or burning material that might ignite accumulations of fibers/flyings or combustible material in the vicinity. For metal pipes, lock seams and riveted or welded joints shall be permitted; and tight-fitting slip joints shall be permitted where some flexibility is necessary, as at connections to motors.

#### 503.130 Luminaires — Class III, Divisions 1 and 2

**(A) Fixed Lighting.** Luminaires for fixed lighting shall provide enclosures for lamps and lampholders that are designed to minimize entrance of fibers/flyings and to prevent the escape of sparks, burning material, or hot metal. Each luminaire shall be clearly marked to show the maximum wattage of the lamps that shall be permitted without exceeding an exposed surface temperature of 165°C (329°F) under normal conditions of use.

**(B) Physical Damage.** A luminaire that may be exposed to physical damage shall be protected by a suitable guard.

**(C) Pendant Luminaires.** Pendant luminaires shall be suspended by stems of threaded rigid metal conduit, threaded intermediate metal conduit, threaded metal tubing of equivalent thickness, or by chains with approved fittings. For stems longer than 300 mm (12 in.), permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm (12 in.) above the lower end of the stem, or flexibility in the form of an identified fitting or a flexible connector shall be provided not more than 300 mm (12 in.) from the point of attachment to the supporting box or fitting.

**(D) Portable Lighting Equipment.** Portable lighting equipment shall be equipped with handles and protected with substantial guards. Lampholders shall be of the unswitched type with no provision for receiving attachment plugs. There shall be no exposed current-carrying metal parts, and all exposed non-current-carrying metal parts shall be grounded. In all other respects, portable lighting equipment shall comply with 503.130(A).

### 503.135 Utilization Equipment — Class III, Divisions 1 and 2

**(A) Heaters.** Electrically heated utilization equipment shall be identified for Class III locations.

**(B) Motors.** Motors of motor-driven utilization equipment shall comply with 503.125.

**(C) Switches, Circuit Breakers, Motor Controllers, and Fuses.** Switches, circuit breakers, motor controllers, and fuses shall comply with 503.115.

### 503.140 Flexible Cords — Class III, Divisions 1 and 2

Flexible cords shall comply with the following:

- (1) Be of a type listed for extra-hard usage
- (2) Contain, in addition to the conductors of the circuit, an equipment grounding conductor complying with 400.23
- 
- (3) Be supported by clamps or other suitable means in such a manner that there will be no tension on the terminal connections
- (4) Be terminated with a listed dusttight cord connector.

### 503.145 Receptacles and Attachment Plugs — Class III, Divisions 1 and 2

Receptacles and attachment plugs shall be of the grounding type, shall be designed so as to minimize the accumulation

or the entry of fibers/flyings, and shall prevent the escape of sparks or molten particles.

*Exception: In locations where, in the judgment of the authority having jurisdiction, only moderate accumulations of lint or flyings are likely to collect in the vicinity of a receptacle, and where such receptacle is readily accessible for routine cleaning, general-purpose grounding-type receptacles mounted so as to minimize the entry of fibers/flyings shall be permitted.*

### 503.150 Signaling, Alarm, Remote-Control, and Local Loudspeaker Intercommunications Systems — Class III, Divisions 1 and 2

Signaling, alarm, remote-control, and local loudspeaker intercommunications systems shall comply with the requirements of Article 503 regarding wiring methods, switches, transformers, resistors, motors, luminaires, and related components.

### 503.155 Electric Cranes, Hoists, and Similar Equipment — Class III, Divisions 1 and 2

Where installed for operation over combustible fibers or accumulations of flyings, traveling cranes and hoists for material handling, traveling cleaners for textile machinery, and similar equipment shall comply with 503.155(A) through (D).

**(A) Power Supply.** The power supply to contact conductors shall be electrically isolated from all other systems, ungrounded, and shall be equipped with an acceptable ground detector that gives an alarm and automatically de-energizes the contact conductors in case of a fault to ground or gives a visual and audible alarm as long as power is supplied to the contact conductors and the ground fault remains.

**(B) Contact Conductors.** Contact conductors shall be located or guarded so as to be inaccessible to other than authorized persons and shall be protected against accidental contact with foreign objects.

**(C) Current Collectors.** Current collectors shall be arranged or guarded so as to confine normal sparking and prevent escape of sparks or hot particles. To reduce sparking, two or more separate surfaces of contact shall be provided for each contact conductor. Reliable means shall be provided to keep contact conductors and current collectors free of accumulations of lint or flyings.

**(D) Control Equipment.** Control equipment shall comply with 503.115 and 503.120.

Section 503.155 specifies the requirements for cranes, hoists, and similar equipment in Class III, Divisions 1 and 2 locations. In these locations, cranes that are installed over accumulations of fibers/flyings and equipped with rolling or sliding collectors that make contact with bare conductors introduce two hazards.

The first hazard results from arcing between a conductor and a collector rail igniting combustible fibers or lint that has accumulated on or near the bare conductor. This hazard may be prevented by maintaining the proper alignment of the bare conductor, by using a collector designed so that proper contact is always maintained, and by using guards or shields to confine hot metal particles that result from arcing.

The second hazard occurs if enough moisture is present and fibers/flyings accumulating on the insulating supports of the bare conductors form a conductive path between the conductors or from one conductor to ground, permitting enough current to flow to ignite the fibers. If the system is ungrounded, a current flow to ground is unlikely to start a fire.

A suitable recording ground detector sounds an alarm and automatically de-energizes contact conductors when the insulation resistance is lowered by an accumulation of fibers on the insulators or in case of a fault to ground. A ground-fault indicator that maintains an alarm until the system is de-energized or the ground fault is cleared is permitted.

### 503.160 Storage Battery Charging Equipment — Class III, Divisions 1 and 2

Storage battery charging equipment shall be located in separate rooms built or lined with substantial noncombustible materials. The rooms shall be constructed to prevent the entrance of ignitable amounts of flyings or lint and shall be well ventilated.

### 504.1 Scope

This article covers the installation of intrinsically safe (I.S.) apparatus, wiring, and systems for Class I, II, and III locations.

Informational Note: For further information, see ANSI/ISA-RP 12.06.01-2003, *Recommended Practice for Wiring Methods for Hazardous (Classified) Locations Instrumentation — Part 1: Intrinsic Safety*.

The standard used in the United States for construction and performance requirements for intrinsically safe (IS) systems is ANSI/UL 913, *Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Division 1, Hazardous (Classified) Locations*. ANSI/UL 913 is similar to standards for IS equipment in other countries; all these standards are based on the IEC (International Electrotechnical Commission) standard. ANSI/UL 60079-11, *Electrical Apparatus for Explosive Gas Atmospheres — Part II: Intrinsic Safety “I,”* is based on the IEC 60079-11 standard, which contains the U.S. deviations that allow it to be compatible for installations in the United States. The NEC offers the choice of designating hazardous locations as two divisions (1 and 2) or three zones (0, 1, and 2). ANSI/UL 60079-11 requirements, however, are based on the zone requirements, including Zone 0, which is the most stringent. Equipment certified by a testing laboratory for Zone 1 would not necessarily meet ANSI/UL 913 requirements for Division 1.

### 504.2 Definitions

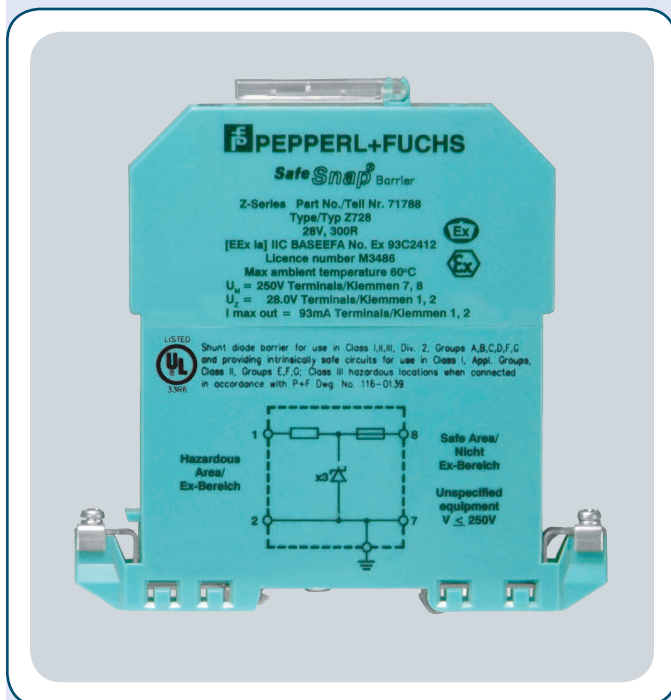

**Associated Apparatus.** Apparatus in which the circuits are not necessarily intrinsically safe themselves but that affect the energy in the intrinsically safe circuits and are relied on to maintain intrinsic safety. Associated apparatus may be either of the following:

- (1) Electrical apparatus that has an alternative-type protection for use in the appropriate hazardous (classified) location
- (2) Electrical apparatus not so protected that shall not be used within a hazardous (classified) location

Informational Note No. 1: Associated apparatus has identified intrinsically safe connections for intrinsically safe apparatus and also may have connections for nonintrinsically safe apparatus.

Informational Note No. 2: An example of associated apparatus is an intrinsic safety barrier, which is a network designed to limit the energy (voltage and current) available to the protected circuit in the hazardous (classified) location, under specified fault conditions.

Informational Note No. 2 identifies an intrinsic safety barrier as a type of associated apparatus that limits energy to a protected circuit. For an example of an IS barrier, see Exhibit 504.1. Note the marking indicating that the installation is to be in accordance with a specific control drawing.

**EXHIBIT 504.1** A typical intrinsic safety barrier that limits the energy available to the hazardous location. (Courtesy of Pepperl and Fuchs, Inc.)

**Control Drawing.** See the definition in 500.2.

**Different Intrinsically Safe Circuits.** Intrinsically safe circuits in which the possible interconnections have not been evaluated and identified as intrinsically safe.

**Intrinsically Safe Apparatus.** Apparatus in which all the circuits are intrinsically safe.

**Intrinsically Safe Circuit.** A circuit in which any spark or thermal effect is incapable of causing ignition of a mixture of flammable or combustible material in air under prescribed test conditions.

Informational Note: Test conditions are described in ANSI/UL 913-1997, *Standard for Safety, Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Division 1, Hazardous (Classified) Locations*.

Due to its physical and electrical characteristics, an IS circuit does not develop sufficient electrical energy (millijoules) in an arc or spark to cause ignition or sufficient thermal energy resulting from an overload condition to cause the temperature of the installed circuit to exceed the ignition temperature of a specified gas or vapor under normal or abnormal operating conditions.

An abnormal condition may be due to accidental damage, failure of electrical components, excessive voltage, or improper adjustment or maintenance of the equipment.

**Intrinsically Safe System.** An assembly of interconnected intrinsically safe apparatus, associated apparatus, and interconnecting cables, in that those parts of the system that may be used in hazardous (classified) locations are intrinsically safe circuits.

Although low-energy devices, such as thermocouples, crystal strain transducers, or pressure transducers, generate millivolts and currents in the microampere range, they are not necessarily intrinsically safe. Low-energy devices are normally connected to amplifiers and power supplies that are connected to 120-volt or higher circuits. Should a fault occur within the amplifier or power supply, or a voltage surge occur in the electrical supply system, high-energy arcing, sparking, or overheating of the low-energy portion of the circuit could occur. Therefore, these devices must be installed as part of an IS system.

Informational Note: An intrinsically safe system may include more than one intrinsically safe circuit.

**Simple Apparatus.** An electrical component or combination of components of simple construction with well-defined electrical parameters that does not generate more than 1.5 volts, 100 milliamps, and 25 milliwatts, or a passive component that does not dissipate more than 1.3 watts and is compatible with the intrinsic safety of the circuit in which it is used.

Informational Note: The following apparatus are examples of simple apparatus:

- (a) Passive components, for example, switches, junction boxes, resistance temperature devices, and simple semiconductor devices such as LEDs
- (b) Sources of stored energy consisting of single components in simple circuits with well-defined parameters, for example, capacitors or inductors, whose values are considered when determining the overall safety of the system
- (c) Sources of generated energy, for example, thermocouples and photocells, which do not generate more than 1.5 V, 100 mA, and 25 mW

The definition of *simple apparatus* clarifies the use of the term in 504.4, Exception, and 504.10, Exception. The intent is to permit the use of apparatus that stores little or no energy without requiring the apparatus to be listed or to be specifically mentioned on the control drawing. The informational note provides examples of simple apparatus.

### 504.3 Application of Other Articles

Except as modified by this article, all applicable articles of this *Code* shall apply.

Requirements throughout the *Code* apply to IS systems except as modified by the rules in Article 504. Because intrinsically safe wiring must be low-energy, the wiring itself is most likely to be Class 2, in accordance with 725.41, or, in a fire-protective signaling system, power-limited in accordance with 760.41. See Article 725 or 760, as appropriate, for the requirements for such wiring. The installation may also fall under the scope of Article 800. The associated apparatus, on the other hand, may be supplied by ordinary power circuits, in which case other *Code* rules may apply.

It is common for IS apparatus to be supplied by associated apparatus located in a hazardous location. This associated apparatus is protected by one of the protection systems permitted by Articles 501 through 503, 505, or 506, that is, explosionproof, dust-ignitionproof, purged, and pressurized. In this case, Articles 501 through 503, 505, and 506 also apply. Also, IS systems are not exempt from the grounding and bonding requirements of 501.30, 502.30, 503.30, and 505.25.

### 504.4 Equipment

All intrinsically safe apparatus and associated apparatus shall be listed.

*Exception: Simple apparatus, as described on the control drawing, shall not be required to be listed.*

### 504.10 Equipment Installation

**(A) Control Drawing.** Intrinsically safe apparatus, associated apparatus, and other equipment shall be installed in accordance with the control drawing(s).

*Exception: A simple apparatus that does not interconnect intrinsically safe circuits.*

Informational Note No. 1: The control drawing identification is marked on the apparatus.

Informational Note No. 2: Associated apparatus with a marked  $U_m$  of less than 250 V may require additional over-voltage protection at the inputs to limit any possible fault voltages to less than the  $U_m$  marked on the product.

An IS system is required to be installed according to the control drawing, which may put limitations on cables and on the separation of circuits in the system. The control drawing also illustrates what is permitted to be connected in the system. Compliance with all the provisions in the control drawing is essential if intrinsic safety is to be maintained. The investigation of the equipment by third-party testing laboratories is based on installation in accordance with the control drawing.

**(B) Location.** Intrinsically safe apparatus shall be permitted to be installed in any hazardous (classified) location for which it has been identified. General-purpose enclosures shall be permitted for intrinsically safe apparatus.

Associated apparatus shall be permitted to be installed in any hazardous (classified) location for which it has been identified or, if protected by other means, permitted by Articles 501 through 503 and Article 505.

Simple apparatus shall be permitted to be installed in any hazardous (classified) location in which the maximum surface temperature of the simple apparatus does not exceed the ignition temperature of the flammable gases or vapors, flammable liquids, combustible dusts, or ignitable fibers/flyings present.

For simple apparatus, the maximum surface temperature can be determined from the values of the output power from the associated apparatus or apparatus to which it is connected to obtain the temperature class. The temperature class can be determined by:

- (1) Reference to Table 504.10(B)
- (2) Calculation using the following equation:

$$T = P_o R_{th} + T_{amb}$$

where:

$T$  = surface temperature

$P_o$  = output power marked on the associated apparatus or intrinsically safe apparatus

$R_{th}$  = thermal resistance of the simple apparatus

$T_{amb}$  = ambient temperature (normally 40°C) and reference Table 500.8(C)

In addition, components with a surface area smaller than 10 cm<sup>2</sup> (excluding lead wires) may be classified as T5 if their surface temperature does not exceed 150°C.

This provides guidance for designers, installers, and inspectors pertaining to simple apparatus installed in hazardous locations. Table 504.10(B) provides the surface temperature allowed for T4 classification based on the total surface area of the equipment. See the definition of *simple apparatus* and the accompanying informational note in 504.2.

**TABLE 504.10(B) Assessment for T4 Classification According to Component Size and Temperature**

Total Surface Area Excluding Lead Wires	Requirement for T4 Classification
<20 mm <sup>2</sup>	Surface temperature ≤275°C
≥20 mm <sup>2</sup> ≤10 cm <sup>2</sup>	Surface temperature ≤200°C
≥20 mm <sup>2</sup>	Power not exceeding 1.3 W*

\*Based on 40°C ambient temperature. Reduce to 1.2 W with an ambient of 60°C or 1.0 W with 80°C ambient temperature.

Informational Note: The following apparatus are examples of simple apparatus:

- (1) Passive components, for example, switches, junction boxes, resistance temperature devices, and simple semiconductor devices such as LEDs
- (2) Sources of generated energy, for example, thermocouples and photocells, which do not generate more than 1.5 V, 100 mA, and 25 mW

## 504.20 Wiring Methods

Any of the wiring methods suitable for unclassified locations, including those covered by Chapter 7 and Chapter 8, shall be permitted for installing intrinsically safe apparatus. Sealing shall be as provided in 504.70, and separation shall be as provided in 504.30.

An IS system evaluation also includes wiring faults and cable parameters (e.g., short circuits and cable capacitance); therefore, any of the wiring methods for unclassified locations may be applied to intrinsically safe systems. See the commentary following 504.3 for more information on the types of circuits typically used as part of an IS system.

## 504.30 Separation of Intrinsically Safe Conductors

### (A) From Nonintrinsically Safe Circuit Conductors.

(1) **In Raceways, Cable Trays, and Cables.** Conductors of intrinsically safe circuits shall not be placed in any race-

way, cable tray, or cable with conductors of any nonintrinsically safe circuit.

*Exception No. 1: Where conductors of intrinsically safe circuits are separated from conductors of nonintrinsically safe circuits by a distance of at least 50 mm (2 in.) and secured, or by a grounded metal partition or an approved insulating partition.*

Informational Note: No. 20 gauge sheet metal partitions 0.91 mm (0.0359 in.) or thicker are generally considered acceptable.

*Exception No. 2: Where either (1) all of the intrinsically safe circuit conductors or (2) all of the nonintrinsically safe circuit conductors are in grounded metal-sheathed or metal-clad cables where the sheathing or cladding is capable of carrying fault current to ground.*

Informational Note: Cables meeting the requirements of Articles 330 and 332 are typical of those considered acceptable.

Type MI cable with a copper sheath and Type MC cable of smooth or corrugated metallic sheath construction meet the conditions prescribed in Exception No. 2. The metallic sheath of interlocked-tape Type MC cable is generally not investigated for suitability as an equipment grounding conductor and, therefore, may not be capable of carrying a fault current to ground as required by Exception No. 2.

*Exception No. 3: Intrinsically safe circuits in a Division 2 or Zone 2 location shall be permitted to be installed in a raceway, cable tray, or cable along with nonincendive field wiring circuits when installed in accordance with 504.30(B).*

*Exception No. 4: Intrinsically safe circuits passing through a Division 2 or Zone 2 location to supply apparatus that is located in a Division 1, Zone 0 or Zone 1 location shall be permitted to be installed in a raceway, cable tray, or cable along with nonincendive field wiring circuits when installed in accordance with 504.30(B).*

Informational Note: Nonincendive field wiring circuits are described in 501.10(B)(3), 502.10(B)(3), 503.10(B)(3), 505.15(C)(1)(g), and 506.15(C)(7).

Exceptions No. 3 and No. 4 permit intrinsically safe circuits in a Division 2 or Zone 2 location to be installed with nonincendive field wiring circuits when the circuits are installed as required for two separate IS circuits.

(2) **Within Enclosures.** Conductors of intrinsically safe circuits shall be secured so that any conductor that might come loose from a terminal is unlikely to come into contact

with another terminal. The conductors shall be separated from conductors of nonintrinsically safe circuits by one of the methods in (1) through (4).

- (1) Separation by at least 50 mm (2 in.) from conductors of any nonintrinsically safe circuits.
- (2) Separation from conductors of nonintrinsically safe circuits by use of a grounded metal partition 0.91 mm (0.0359 in.) or thicker.
- (3) Separation from conductors of nonintrinsically safe circuits by use of an approved insulating partition.
- (4) Where either (1) all of the intrinsically safe circuit conductors or (2) all of the nonintrinsically safe circuit conductors are in grounded metal-sheathed or metal-clad cables where the sheathing or cladding is capable of carrying fault current to ground.

Informational Note No. 1: Cables meeting the requirements of Articles 330 and 332 are typical of those considered acceptable.

Informational Note No. 2: The use of separate wiring compartments for the intrinsically safe and nonintrinsically safe terminals is a typical method of complying with this requirement.

Informational Note No. 3: Physical barriers such as grounded metal partitions or approved insulating partitions or approved restricted access wiring ducts separated from other such ducts by at least 19 mm (¾ in.) can be used to help ensure the required separation of the wiring.

The intent of 504.30(A) is to prevent the intrusion of unsafe energy into the IS system as a result of a wiring fault. Because low-voltage, low-energy but nonintrinsically safe circuits are permitted by Articles 725 and 800 to be minimally insulated and may not be protected by being installed in raceways or cables, particularly in nonhazardous locations, it is essential that nonintrinsically safe circuits and intrinsically safe circuits be physically and electrically separated.

**(3) Other (Not in Raceway or Cable Tray Systems).** Conductors and cables of intrinsically safe circuits run in other than raceway or cable tray systems shall be separated by at least 50 mm (2 in.) and secured from conductors and cables of any nonintrinsically safe circuits.

Even when not installed in an enclosure, raceway, or cable tray, intrinsically safe circuit conductors are required to be securely separated from other conductors.

*Exception: Where either (1) all of the intrinsically safe circuit conductors are in Type MI or MC cables or (2) all of the nonintrinsically safe circuit conductors are in raceways*

*or Type MI or MC cables where the sheathing or cladding is capable of carrying fault current to ground.*

**(B) From Different Intrinsically Safe Circuit Conductors.** The clearance between two terminals for connection of field wiring of different intrinsically safe circuits shall be at least 6 mm (0.25 in.), unless this clearance is permitted to be reduced by the control drawing. Different intrinsically safe circuits shall be separated from each other by one of the following means:

- (1) The conductors of each circuit are within a grounded metal shield.
- (2) The conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.).

*Exception: Unless otherwise identified.*

The minimum required clearance provides a safeguard against an inadvertent connection between adjacent terminals (with different IS circuits) that could occur during maintenance or connection of a new circuit to an existing terminal block for IS circuits.

## 504.50 Grounding

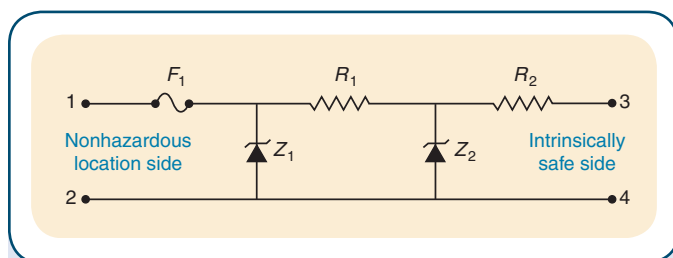

**(A) Intrinsically Safe Apparatus, Enclosures, and Raceways.** Intrinsically safe apparatus, enclosures, and raceways, if of metal, shall be connected to the equipment grounding conductor.

Informational Note: In addition to an equipment grounding conductor connection, a connection to a grounding electrode may be needed for some associated apparatus, for example, zener diode barriers, if specified in the control drawing. See ANSI/ISA-RP 12.06.01-2003, *Recommended Practice for Wiring Methods for Hazardous (Classified) Locations Instrumentation — Part 1: Intrinsic Safety*.

**(B) Associated Apparatus and Cable Shields.** Associated apparatus and cable shields shall be grounded in accordance with the required control drawing. See 504.10(A).

Informational Note: Supplementary connection(s) to the grounding electrode may be needed for some associated apparatus, for example, zener diode barriers, if specified in the control drawing. See ANSI/ISA RP 12.06.01-2003, *Recommended Practice for Wiring Methods for Hazardous (Classified) Locations Instrumentation — Part 1: Intrinsic Safety*.

The informational notes to 504.50 identify zener diode barriers as a type of apparatus requiring a grounding electrode in an IS system. Exhibit 504.2 illustrates a common type of zener diode barrier, which is often called a shunt diode

**EXHIBIT 504.2** Zener or shunt diode barrier.

barrier. Maintaining a low-impedance path to ground for zener diode barrier systems is important because such systems shunt fault currents to ground.

Through the use of fuses, resistors, and zener diodes, the shunt diode barrier limits the fault energy delivered to the hazardous location to a level below the ignition energy of a given classified material or group. The basic concept of intrinsic safety is that safety be maintained in the event of two simultaneous faults. For example, although the diodes themselves can be considered subject to open-circuit fault, they are redundant components, and either one alone provides the necessary protection in the event of a first fault, that is, high voltage across input terminals 1 and 2. Terminals 2 and 4 and the ends of the two diodes are connected to a ground bus that, in turn, is connected to a ground system to which all grounds in the IS system are connected. A very low impedance (1 ohm or less is usually recommended) is necessary so that the voltage level on the ground bus will not be raised to an unsafe level under high-current fault conditions.

The basic operation of a shunt diode barrier is that under normal operating conditions, the input voltage is below that of the diodes. Therefore, the barrier simply adds a small amount of resistance into the circuit. With 250 volts ac across terminals 1 and 2, representing a fault in associated apparatus on the nonhazardous location side of the barrier, diode  $Z_1$  conducts at its rated voltage, thus limiting the output voltage of the circuit. The voltage at which this diode conducts is designed to be higher than the rated input voltage (under no-fault conditions) at terminals 1 and 2. Fuse  $F_1$  is selected so that it will open before the power rating of  $Z_1$  is exceeded. Diode  $Z_2$  usually conducts within 1 or 2 volts of  $Z_1$  and serves as a backup in the event  $Z_1$  fails in an open-circuit condition for any reason. At the output voltage of  $Z_1$  and  $Z_2$ , resistor  $R_2$  limits the current in the IS circuit. Therefore, with up to 250 volts ac applied to the input of the circuit (terminals 1 and 2) as a result of a fault, the output at terminals 3 and 4 cannot exceed the voltage and current permitted by the diodes and resistor. The rating of the components and therefore the barrier output level is selected to be below the ignition energy of the material or group for which the barrier is designed.

Shunt diode barriers normally have maximum allowable inductance and capacitance ratings on the intrinsically safe side even though both the output voltage and current are limited. Too much inductance in the circuit could result in the release of an ignition-capable spark when the circuit is opened. In a like manner, too much capacitance could result in the release of an ignition-capable spark if there were a short-circuit between wires or between a wire and ground.

Wiring always has inductance and capacitance associated with it, depending on the spacing between conductors, size of conductors, and length of conductors. It is necessary, therefore, to limit the length of conductors connected to an intrinsic safety barrier, just as it is necessary to limit the inductance and capacitance of connected equipment. The length limitation is usually on the order of thousands of feet. The control drawing provides information on installation limitations.

By adjusting the values of its components, the barrier can be designed for a variety of uses, including different types of instrument systems and thermocouples. Barriers such as described are available commercially from a number of manufacturers.

**(C) Connection to Grounding Electrodes.** Where connection to a grounding electrode is required, the grounding electrode shall be as specified in 250.52(A)(1), (A)(2), (A)(3), and (A)(4) and shall comply with 250.30(A)(4). Sections 250.52(A)(5), (A)(7), and (A)(8) shall not be used if any of the electrodes specified in 250.52(A)(1), (A)(2), (A)(3), or (A)(4) are present.

Where a grounding electrode is necessary for associated apparatus, the electrodes specified in 250.52(A)(1) through (A)(4) (metal underground water pipes, the metal frame of a building, concrete-encased electrodes, and ground rings) are required to be used if present. These electrodes usually provide lower resistance grounds than ground rods and plate electrodes, covered in 250.52(A)(5) and (A)(7).

## 504.60 Bonding

**(A) Hazardous Locations.** In hazardous (classified) locations, intrinsically safe apparatus shall be bonded in the hazardous (classified) location in accordance with 250.100.

**(B) Unclassified.** In unclassified locations, where metal raceways are used for intrinsically safe system wiring in hazardous (classified) locations, associated apparatus shall be bonded in accordance with 501.30(A), 502.30(A), 503.30(A), 505.25, or 506.25 as applicable.

**504.70 Sealing**

Conduits and cables that are required to be sealed by 501.15, 502.15, 505.16, and 506.16 shall be sealed to minimize the passage of gases, vapors, or dusts. Such seals shall not be required to be explosionproof or flameproof but shall be identified for the purpose of minimizing passage of gases, vapors, or dusts under normal operating conditions and shall be accessible.

Seals in intrinsically safe wiring systems are not required to be explosionproof or flameproof, but they must be identified to minimize the passage of gases or dust and must be accessible.

*Exception: Seals shall not be required for enclosures that contain only intrinsically safe apparatus, except as required by 501.15(F)(3).*

**504.80 Identification**

Labels required by this section shall be suitable for the environment where they are installed with consideration given to exposure to chemicals and sunlight.

**(A) Terminals.** Intrinsically safe circuits shall be identified at terminal and junction locations in a manner that **is intended** to prevent unintentional interference with the circuits during testing and servicing.

**(B) Wiring.** Raceways, cable trays, and other wiring methods for intrinsically safe system wiring shall be identified with permanently affixed labels with the wording “Intrinsic Safety Wiring” or equivalent. The labels shall be located so as to be visible after installation and placed so that they may be readily traced through the entire length of the installation. Intrinsic safety circuit labels shall appear in every section of the wiring system that is separated by enclosures, walls, partitions, or floors. Spacing between labels shall not be more than 7.5 m (25 ft).

*Exception: Circuits run underground shall be permitted to be identified where they become accessible after emergence from the ground.*

Informational Note No. 1: Wiring methods permitted in unclassified locations may be used for intrinsically safe systems in hazardous (classified) locations. Without labels to identify the application of the wiring, enforcement authorities cannot determine that an installation is in compliance with this Code.

Informational Note No. 2: In unclassified locations, identification is necessary to ensure that nonintrinsically safe wire will not be inadvertently added to existing raceways at a later date.

**(C) Color Coding.** Color coding shall be permitted to identify intrinsically safe conductors where they are colored light blue and where no other conductors colored light blue are used. Likewise, color coding shall be permitted to identify raceways, cable trays, and junction boxes where they are colored light blue and contain only intrinsically safe wiring.

Informational Note: Text that is followed by a reference in brackets has been extracted from NFPA 497-2008, *Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*. Only editorial changes were made to the extracted text to make it consistent with this *Code*.

### 505.1 Scope

This article covers the requirements for the zone classification system as an alternative to the division classification system covered in Article 500 for electrical and electronic equipment and wiring for all voltages in Class I, Zone 0, Zone 1, and Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases, vapors, or liquids.

Informational Note: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Division 1 or Division 2; Class II, Division 1 or Division 2; and Class III, Division 1 or Division 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors, flammable liquids, or combustible dusts or fibers, refer to Articles 500 through 504.

The requirements covering wiring methods, sealing, and flexible cord use, so that the Class I, Zone 0, Zone 1, and Zone 2 area classification concept can be used as a separate set of requirements, parallel those in Articles 500 and 501

covering installations that use the Class I Division area classification concept. The zone classification concept, based on the standards for area classification used by the International Electrotechnical Commission (IEC), offers an alternative method of classifying Class I hazardous locations. The IEC classification scheme includes underground mines, whereas in the United States, mines are under the jurisdiction of the Mine Safety and Health Administration (MSHA) and are outside the scope of the *NEC*.

### 505.2 Definitions

For purposes of this article, the following definitions apply.

**Combustible Gas Detection System.** A protection technique utilizing stationary gas detectors in industrial establishments.

**Electrical and Electronic Equipment.** Materials, fittings, devices, appliances, and the like that are part of, or in connection with, an electrical installation.

Informational Note: Portable or transportable equipment having self-contained power supplies, such as battery-operated equipment, could potentially become an ignition source in hazardous (classified) locations.

**Encapsulation "m."** Type of protection where electrical parts that could ignite an explosive atmosphere by either sparking or heating are enclosed in a compound in such a way that this explosive atmosphere cannot be ignited.

Informational Note No. 1: See ANSI/ISA-60079-18 (12.23.01)-2009, *Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Encapsulation "m"*; IEC 60079-18-1992, *Electrical apparatus for explosive gas atmospheres — Part 18: Encapsulation "m"*; and ANSI/UL 60079-18, *Electrical Apparatus for Explosive Gas Atmospheres — Part 18: Encapsulation "m"*.

Informational Note No. 2: Encapsulation is designated type of protection "ma" for use in Zone 0 locations. Encapsulation is designated type of protection "m" or "mb" for use in Zone 1 locations.

**Flameproof "d."** Type of protection where the enclosure will withstand an internal explosion of a flammable mixture that has penetrated into the interior, without suffering damage and without causing ignition, through any joints or structural openings in the enclosure, of an external explosive gas atmosphere consisting of one or more of the gases or vapors for which it is designed.

Informational Note: See ANSI/ISA-60079-1 (12.22.01)-2008, *Explosive Atmospheres, Part 1: Equipment protection by flameproof enclosures "d"*; and ANSI/UL 60079-1, *Electrical Apparatus for Explosive Gas Atmospheres — Part 1: Flameproof Enclosures "d."*

**Increased Safety “e.”** Type of protection applied to electrical equipment that does not produce arcs or sparks in normal service and under specified abnormal conditions, in which additional measures are applied so as to give increased security against the possibility of excessive temperatures and of the occurrence of arcs and sparks.

Informational Note: See ANSI/ISA-60079-7 (12.16.01)-2008, *Explosive Atmospheres, Part 7: Equipment protection by increased safety “e”*; and ANSI/UL 60079-7, *Electrical Apparatus for Explosive Gas Atmospheres — Part 7: Increased Safety “e.”*

**Intrinsic Safety “i.”** Type of protection where any spark or thermal effect is incapable of causing ignition of a mixture of flammable or combustible material in air under prescribed test conditions.

Informational Note No. 1: See ANSI/UL 913-1997, *Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Hazardous Locations*; ANSI/ISA-60079-11 (12.02.01)-2009, *Explosive Atmospheres, Part 11: Equipment protection by intrinsic safety “i”*; and ANSI/UL 60079-11, *Explosive Atmospheres, Part 11: Equipment protection by intrinsic safety “i.”*

Informational Note No. 2: Intrinsic safety is designated type of protection “ia” for use in Zone 0 locations. Intrinsic safety is designated type of protection “ib” for use in Zone 1 locations. Intrinsic safety is designated type of protection “ic” for use in Zone 2 locations.

Informational Note No. 3: Intrinsically safe associated apparatus, designated by [ia], [ib], or [ic], is connected to intrinsically safe apparatus (“ia,” “ib,” or “ic,” respectively) but is located outside the hazardous (classified) location unless also protected by another type of protection (such as flameproof).

**Oil Immersion “o.”** Type of protection where electrical equipment is immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

Informational Note: See ANSI/ISA-60079-6 (12.00.05)-2009, *Explosive Atmospheres, Part 6: Equipment protection by oil immersion “o”*; and ANSI/UL 60079-6, *Electrical Apparatus for Explosive Gas Atmospheres — Part 6: Oil-Immersion “o.”*

**Powder Filling “q.”** Type of protection where electrical parts capable of igniting an explosive atmosphere are fixed in position and completely surrounded by filling material (glass or quartz powder) to prevent the ignition of an external explosive atmosphere.

Informational Note: See ANSI/ISA-60079-5 (12.00.04)-2009, *Explosive Atmospheres, Part 5: Equipment protection by powder filling “q”*; and ANSI/UL 60079-5, *Electrical Apparatus for Explosive Gas Atmospheres — Part 5: Powder Filling “q.”*

**Pressurization “p.”** Type of protection for electrical equipment that uses the technique of guarding against the ingress

of the external atmosphere, which may be explosive, into an enclosure by maintaining a protective gas therein at a pressure above that of the external atmosphere.

Informational Note: See ANSI/ISA-60079-2 (12.04.01)-2004, *Explosive Atmospheres, Part 2: Equipment protection by pressurized enclosures “p”*; and IEC 60079-13, *Electrical apparatus for explosive gas atmospheres — Part 13: Construction and use of rooms or buildings protected by pressurization.*

**Type of Protection “n.”** Type of protection where electrical equipment, in normal operation, is not capable of igniting a surrounding explosive gas atmosphere and a fault capable of causing ignition is not likely to occur.

Informational Note: See ANSI/UL 60079-15, *Electrical Apparatus for Explosive Gas Atmospheres — Part 15: Type of Protection “n”*; and ANSI/ISA-60079-15 (12.12.02)-2008, *Electrical Apparatus for Use in Class I, Zone 2 Hazardous (Classified) Locations: Type of Protection “n.”*

**Unclassified Locations.** Locations determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Zone 1; Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof.

## 505.3 Other Articles

All other applicable rules contained in this *Code* shall apply to electrical equipment and wiring installed in hazardous (classified) locations.

*Exception: As modified by Article 504 and this article.*

Except as modified by Articles 504 and 505, requirements throughout the *Code* must be applied to equipment and wiring in hazardous locations under the zone classification system. The commentary following 500.3 provides information on other *Code* requirements that apply to electrical equipment and wiring.

## 505.4 General

**(A) Documentation for Industrial Occupancies.** All areas in industrial occupancies designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.

Informational Note: For examples of area classification drawings, see ANSI/API RP 505-1997, *Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2*; ANSI/ISA-TR(12.24.01)-1998 (IEC 60079-10 Mod), *Recommended Practice for Classification of Locations for Electrical Installations Classified as*

*Class I, Zone 0, Zone 1, or Zone 2; IEC 60079-10-1995, Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas; and Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.*

**(B) Reference Standards.** Important information relating to topics covered in Chapter 5 may be found in other publications.

Informational Note No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with standards of the National Fire Protection Association (NFPA), the American Petroleum Institute (API), the International Society of Automation (ISA), and the International Electrotechnical Commission (IEC) that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

Informational Note No. 2: For further information on the classification of locations, see NFPA 497-2008, *Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*; ANSI/API RP 505-1997, *Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2*; ANSI/ISA-TR(12.24.01)-1998 (IEC 60079-10-Mod), *Recommended Practice for Classification of Locations for Electrical Installations Classified as Class I, Zone 0, Zone 1, or Zone 2; IEC 60079-10-1995, Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas; and Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.*

Informational Note No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see NFPA 77-2007, *Recommended Practice on Static Electricity*; NFPA 780-2011, *Standard for the Installation of Lightning Protection Systems*; and API RP 2003-1998, *Protection Against Ignitions Arising Out of Static Lightning and Stray Currents*.

Informational Note No. 4: For further information on ventilation, see NFPA 30-2008, *Flammable and Combustible Liquids Code*, and ANSI/API RP 505-1997, *Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2*.

Informational Note No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, see ANSI/API RP 14FZ-2000, *Recommended Practice for Design and Installation of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class I, Zone 0, Zone 1, and Zone 2 Locations*.

Informational Note No. 6: For further information on the installation of electrical equipment in hazardous (classified) locations in general, see IEC 60079-14-1996, *Electrical apparatus for explosive gas atmospheres — Part 14: Electrical installations in explosive gas atmospheres (other than mines)*, and IEC 60079-16-1990, *Electrical apparatus for*

*explosive gas atmospheres — Part 16: Artificial ventilation for the protection of analyzer(s) houses.*

Informational Note No. 7: For further information on application of electrical equipment in hazardous (classified) locations in general, see ANSI/ISA-60079-0 (12.00.01)-2005, *Electrical Apparatus for Use in Class I, Zones 0, and 1, Hazardous (Classified) Locations: General Requirements*; ANSI/ISA-12.01.01-1999, *Definitions and Information Pertaining to Electrical Apparatus in Hazardous (Classified) Locations*; and ANSI/UL 60079-0, *Electrical Apparatus for Explosive Gas Atmospheres — Part 0: General Requirements*.

## 505.5 Classifications of Locations

**(A) Classification of Locations.** Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified. Each room, section, or area shall be considered individually in determining its classification.

Informational Note No. 1: See 505.7 for restrictions on area classification.

Informational Note No. 2: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in reduced level of classification or in an unclassified location and, thus, to reduce the amount of special equipment required.

Rooms and areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation may be classified as “unclassified” locations.

Informational Note: For further information regarding classification and ventilation of areas involving ammonia, see ANSI/ASHRAE 15-1994, *Safety Code for Mechanical Refrigeration*; and ANSI/CGA G2.1-1989 (14-39), *Safety Requirements for the Storage and Handling of Anhydrous Ammonia*.

**(B) Class I, Zone 0, 1, and 2 Locations.** Class I, Zone 0, 1, and 2 locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitable mixtures. Class I, Zone 0, 1, and 2 locations shall include those specified in 505(B)(1), (B)(2), and (B)(3).

**(1) Class I, Zone 0.** A Class I, Zone 0 location is a location in which

- (1) Ignitable concentrations of flammable gases or vapors are present continuously, or
- (2) Ignitable concentrations of flammable gases or vapors are present for long periods of time.

Informational Note No. 1: As a guide in determining when flammable gases or vapors are present continuously or for

long periods of time, refer to ANSI/API RP 505-1997, *Recommended Practice for Classification of Locations for Electrical Installations of Petroleum Facilities Classified as Class I, Zone 0, Zone 1 or Zone 2*; ANSI/ISA-TR12.24.01-1998 (IEC 60079-10 Mod), *Recommended Practice for Classification of Locations for Electrical Installations Classified as Class I, Zone 0, Zone 1, or Zone 2*; IEC 60079-10-1995, *Electrical apparatus for explosive gas atmospheres, classifications of hazardous areas*; and *Area Classification Code for Petroleum Installations, Model Code, Part 15*, Institute of Petroleum.

Informational Note No. 2: This classification includes locations inside vented tanks or vessels that contain volatile flammable liquids; inside inadequately vented spraying or coating enclosures, where volatile flammable solvents are used; between the inner and outer roof sections of a floating roof tank containing volatile flammable liquids; inside open vessels, tanks and pits containing volatile flammable liquids; the interior of an exhaust duct that is used to vent ignitable concentrations of gases or vapors; and inside inadequately ventilated enclosures that contain normally venting instruments utilizing or analyzing flammable fluids and venting to the inside of the enclosures.

Informational Note No. 3: It is not good practice to install electrical equipment in Zone 0 locations except when the equipment is essential to the process or when other locations are not feasible. [See 505.5(A) Informational Note No. 2.] If it is necessary to install electrical systems in a Zone 0 location, it is good practice to install intrinsically safe systems as described by Article 504.

**(2) Class I, Zone 1.** A Class I, Zone 1 location is a location

- (1) In which ignitable concentrations of flammable gases or vapors are likely to exist under normal operating conditions; or
- (2) In which ignitable concentrations of flammable gases or vapors may exist frequently because of repair or maintenance operations or because of leakage; or
- (3) In which equipment is operated or processes are carried on, of such a nature that equipment breakdown or faulty operations could result in the release of ignitable concentrations of flammable gases or vapors and also cause simultaneous failure of electrical equipment in a mode to cause the electrical equipment to become a source of ignition; or
- (4) That is adjacent to a Class I, Zone 0 location from which ignitable concentrations of vapors could be communicated, unless communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

Informational Note No. 1: Normal operation is considered the situation when plant equipment is operating within its design parameters. Minor releases of flammable material may be part of normal operations. Minor releases include the releases from mechanical packings on pumps. Failures that involve repair or shutdown (such as the breakdown of pump seals and flange gaskets, and spillage caused by accidents) are not considered normal operation.

Informational Note No. 2: This classification usually includes locations where volatile flammable liquids or liquefied flammable gases are transferred from one container to another. In areas in the vicinity of spraying and painting operations where flammable solvents are used; adequately ventilated drying rooms or compartments for evaporation of flammable solvents; adequately ventilated locations containing fat and oil extraction equipment using volatile flammable solvents; portions of cleaning and dyeing plants where volatile flammable liquids are used; adequately ventilated gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape; inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids; the interiors of refrigerators and freezers in which volatile flammable materials are stored in the open, lightly stoppered, or in easily ruptured containers; and other locations where ignitable concentrations of flammable vapors or gases are likely to occur in the course of normal operation but not classified Zone 0.

**(3) Class I, Zone 2.** A Class I, Zone 2 location is a location

- (1) In which ignitable concentrations of flammable gases or vapors are not likely to occur in normal operation and, if they do occur, will exist only for a short period; or
- (2) In which volatile flammable liquids, flammable gases, or flammable vapors are handled, processed, or used but in which the liquids, gases, or vapors normally are confined within closed containers or closed systems from which they can escape, only as a result of accidental rupture or breakdown of the containers or system, or as a result of the abnormal operation of the equipment with which the liquids or gases are handled, processed, or used; or
- (3) In which ignitable concentrations of flammable gases or vapors normally are prevented by positive mechanical ventilation but which may become hazardous as a result of failure or abnormal operation of the ventilation equipment; or
- (4) That is adjacent to a Class I, Zone 1 location, from which ignitable concentrations of flammable gases or vapors could be communicated, unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

Informational Note: The Zone 2 classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used but which would become hazardous only in case of an accident or of some unusual operating condition.

## 505.6 Material Groups

For purposes of testing, approval, and area classification, various air mixtures (not oxygen enriched) shall be grouped as required in 505.6(A), (B), and (C).

Informational Note: Group I is intended for use in describing atmospheres that contain firedamp (a mixture of gases,

composed mostly of methane, found underground, usually in mines). This *Code* does not apply to installations underground in mines. See 90.2(B).

Group II shall be subdivided into IIC, IIB, and IIA, as noted in 505.6(A), (B), and (C), according to the nature of the gas or vapor, for protection techniques “d,” “ia,” “ib,” “[ia],” and “[ib],” and, where applicable, “n” and “o.”

Informational Note No. 1: The gas and vapor subdivision as described above is based on the maximum experimental safe gap (MESG), minimum igniting current (MIC), or both. Test equipment for determining the MESG is described in IEC 60079-1A-1975, Amendment No. 1 (1993), *Construction and verification tests of flameproof enclosures of electrical apparatus*; and *UL Technical Report No. 58* (1993). The test equipment for determining MIC is described in IEC 60079-11-1999, *Electrical apparatus for explosive gas atmospheres — Part 11: Intrinsic safety “i.”* The classification of gases or vapors according to their maximum experimental safe gaps and minimum igniting currents is described in IEC 60079-12-1978, *Classification of mixtures of gases or vapours with air according to their maximum experimental safe gaps and minimum igniting currents*.

Informational Note No. 2: Verification of electrical equipment utilizing protection techniques “e,” “m,” “p,” and “q,” due to design technique, does not require tests involving MESG or MIC. Therefore, Group II is not required to be subdivided for these protection techniques.

Informational Note No. 3: It is necessary that the meanings of the different equipment markings and Group II classifications be carefully observed to avoid confusion with Class I, Divisions 1 and 2, Groups A, B, C, and D.

The gas or vapor group order in the zone classification system is the approximate inverse of the gas or vapor groups specified in Article 500. For example, Group IIC includes Article 500, Groups A and B. Determination of a gas or vapor for the purposes of grouping includes the evaluation of the maximum safe experimental gap ratio as well as minimum igniting current ratio. Although the maximum safe experimental gap for Group A is less than that for Group B in some circumstances, the minimum igniting current ratio is less for hydrogen (Group B) than it is for acetylene (Group A). This difference has been accounted for in ANSI/UL 913, *Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, III, Division 1, Hazardous (Classified) Locations*, because it is a factor that must be considered in the evaluation of IS apparatus.

Class I, Zone 0, 1, and 2, groups shall be as follows:

**(A) Group IIC.** Atmospheres containing acetylene, hydrogen, or flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.50 mm or mini-

mum igniting current ratio (MIC ratio) less than or equal to 0.45. [497:3.3.5.2.1]

Informational Note: Group IIC is equivalent to a combination of Class I, Group A, and Class I, Group B, as described in 500.6(A)(1) and (A)(2).

**(B) Group IIB.** Atmospheres containing acetaldehyde, ethylene, or flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either maximum experimental safe gap (MESG) values greater than 0.50 mm and less than or equal to 0.90 mm or minimum igniting current ratio (MIC ratio) greater than 0.45 and less than or equal to 0.80. [497:3.3.5.2.2]

Informational Note: Group IIB is equivalent to Class I, Group C, as described in 500.6(A)(3).

**(C) Group IIA.** Atmospheres containing acetone, ammonia, ethyl alcohol, gasoline, methane, propane, or flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.90 mm or minimum igniting current ratio (MIC ratio) greater than 0.80. [497:3.3.5.2.3]

Informational Note: Group IIA is equivalent to Class I, Group D as described in 500.6(A)(4).

## 505.7 Special Precaution

Article 505 requires equipment construction and installation that ensures safe performance under conditions of proper use and maintenance.

Informational Note No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to the installation and maintenance of electrical equipment in hazardous (classified) locations.

Informational Note No. 2: Low ambient conditions require special consideration. Electrical equipment depending on the protection techniques described by 505.8(A) may not be suitable for use at temperatures lower than  $-20^{\circ}\text{C}$  ( $-4^{\circ}\text{F}$ ) unless they are identified for use at lower temperatures. However, at low ambient temperatures, flammable concentrations of vapors may not exist in a location classified Class I, Zones 0, 1, or 2 at normal ambient temperature.

**(A) Implementation of Zone Classification System.** Classification of areas, engineering and design, selection of equipment and wiring methods, installation, and inspection shall be performed by qualified persons.

**(B) Dual Classification.** In instances of areas within the same facility classified separately, Class I, Zone 2 locations shall be permitted to abut, but not overlap, Class I, Division 2 locations. Class I, Zone 0 or Zone 1 locations shall not abut Class I, Division 1 or Division 2 locations.

An installation is permitted to be designed using either the classification scheme of Article 500 or the classification scheme of Article 505. Both schemes cannot be used for classifying the same area. In areas within the same facility, Class I, Zone 2 locations are allowed to be adjacent to and share the same border, but they are not allowed to overlap Class I, Division 2 locations. However, Class I, Zone 0 or Zone 1 locations are not allowed to be adjacent to and share the same border with Class I, Division 1 or Division 2 locations.

**(C) Reclassification Permitted.** A Class I, Division 1 or Division 2 location shall be permitted to be reclassified as a Class I, Zone 0, Zone 1, or Zone 2 location, provided all of the space that is classified because of a single flammable gas or vapor source is reclassified under the requirements of this article.

**(D) Solid Obstacles.** Flameproof equipment with flanged joints shall not be installed such that the flange openings are closer than the distances shown in Table 505.7(D) to any solid obstacle that is not a part of the equipment (such as steelworks, walls, weather guards, mounting brackets, pipes, or other electrical equipment) unless the equipment is listed for a smaller distance of separation.

**TABLE 505.7(D) Minimum Distance of Obstructions from Flameproof “d” Flange Openings**

Gas Group	Minimum Distance	
	mm	in.
IIC	40	1 <sup>37</sup> / <sub>64</sub>
IIB	30	1 <sup>3</sup> / <sub>16</sub>
IIA	10	2 <sup>5</sup> / <sub>64</sub>

**(E) Simultaneous Presence of Flammable Gases and Combustible Dusts or Fibers/Flyings.** Where flammable gases, combustible dusts, or fibers/flyings are or may be present at the same time, the simultaneous presence shall be considered during the selection and installation of the electrical equipment and the wiring methods, including the determination of the safe operating temperature of the electrical equipment.

505.8 Protection Techniques

Acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations shall be as described in 505.8(A) through (I).

Informational Note: For additional information, see ANSI/ISA-60079-0 (12.00.01)-2009, *Electrical Apparatus for Use*

*in Class I, Zones 0, 1, and 2 Hazardous (Classified) Locations, General Requirements; ANSI/ISA-12.01.01-1999, Definitions and Information Pertaining to Electrical Apparatus in Hazardous (Classified) Locations; and ANSI/UL 60079-0, Electrical Apparatus for Explosive Gas Atmospheres — Part 0: General Requirements.*

Where the area is classified in accordance with the zone method, 505.8(A) through (K) identify the following methods for protecting electrical and electronic equipment:

1. In Class I, Zone 1, equipment identified as flameproof “d,” which is very similar to explosionproof equipment in the United States.
2. Purged and pressurized equipment for Class I, Zone 1 or Zone 2 locations for which it is identified. The pressurization technique is divided into types “px,” “py,” and “pz.”
3. Intrinsic safety techniques for the Class I, Zone 0, Zone 1, or Zone 2 for which the technique is acceptable.
4. In Class I, Zone 2, equipment identified as type “n,” which under normal operation is not capable of igniting a surrounding explosive gas atmosphere and is not likely to create a fault that is capable of causing ignition.
5. Oil immersion “o” technique for Class I, Zone 1 or Zone 2, where the equipment or part of the equipment is immersed in a protective liquid so that explosive gases above or outside the enclosure cannot be ignited.
6. A type of protection technique of increased safety “e” identified for Class I, Zone 1 or Zone 2, in which the electrical equipment involved does not produce arcs or sparks or excessive temperature under normal operation, as well as under abnormal conditions, under specified conditions of operation.
7. The encapsulation technique in which the arcing, sparking, or hot parts are completely surrounded in a compound in such a way that an explosive gas or vapor cannot be ignited. The encapsulation protection technique is broken down into “ma,” which is Class 1, Zone 0, Zone 1, or Zone 2, and the less stringent “m” and “mb,” which are Class 1, Zone 1 or Zone 2.
8. A technique using powder filling “q” in which the arcing, sparking, or hot parts of the equipment are surrounded by a material such as glass or quartz powder to prevent ignition of an external explosive atmosphere in a Class I, Zone 1 or Zone 2 area.

The letter in quotation marks following the protection method is the letter used in the marking on the equipment. See 505.9(C) for marking requirements. Of the many protection techniques, intrinsic safety, flameproof, and increased safety are the most common for Zone 1 locations.

**(A) Flameproof “d”.** This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

Flameproof protection is commonly combined with increased safety protection. For example, motor control and other switching contacts are commonly protected by flameproof enclosures with the field wiring terminals protected in a separate but attached enclosure by increased safety. The conductors between the enclosures are protected by flameproof feed-through insulators. The equipment shown in Exhibit 505.1 employs this combination of protection techniques.

**EXHIBIT 505.1** Typical control stations with the combination of flameproof and increased safety types of protection suitable for use in Class I, Zone 1 areas. (Courtesy of Cooper Crouse-Hinds)

**(B) Purged and Pressurized.** This protection technique shall be permitted for equipment in those Class I, Zone 1 or Zone 2 locations for which it is identified.

**(C) Intrinsic Safety.** This protection technique shall be permitted for apparatus and associated apparatus in Class I, Zone 0, Zone 1, or Zone 2 locations for which it is listed.

The identifying letter for intrinsic safety is “i” followed by either “a,” “b,” or “c” indicating whether the equipment is suitable for Zone 0 (ia), Zone 1 (ib), or Zone 2 (ic). The associated apparatus is identified by the same letters in brackets, that is, [ia], [ib], or [ic].

The “ic” classification extends the intrinsic safety concept to Zone 2 locations. The concept is similar to the nonin-

cendive technique in that faults to the circuit or system are not applied.

**(D) Type of Protection “n”.** This protection technique shall be permitted for equipment in Class I, Zone 2 locations. Type of protection “n” is further subdivided into nA, nC, and nR.

Informational Note: See Table 505.9(C)(2)(4) for the descriptions of subdivisions for type of protection “n”.

**(E) Oil Immersion “o”.** This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

**(F) Increased Safety “e”.** This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

The increased safety protection technique is commonly used for terminal boxes, fluorescent luminaires, motors, and generators (see 505.22).

**(G) Encapsulation “m”.** This protection technique shall be permitted for equipment in Class I, Zone 0, Zone 1, or Zone 2 locations for which it is identified.

Informational Note: See Table 505.9(C)(2)(4) for the descriptions of subdivisions for encapsulation.

**(H) Powder Filling “q”.** This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

**(I) Combustible Gas Detection System.** A combustible gas detection system shall be permitted as a means of protection in industrial establishments with restricted public access and where the conditions of maintenance and supervision ensure that only qualified persons service the installation. Where such a system is installed, equipment specified in 505.8(I)(1), (I)(2), or (I)(3) shall be permitted. The type of detection equipment, its listing, installation location(s), alarm and shutdown criteria, and calibration frequency shall be documented when combustible gas detectors are used as a protection technique.

Informational Note No. 1: For further information, see ANSI/API RP 505-1997, *Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, and Zone 2*.

Informational Note No. 2: For further information, see ANSI/ISA-60079-29-2, *Explosive Atmospheres - Part 29-2: Gas detectors - Selection, installation, use and maintenance of detectors for flammable gases and oxygen*.

Informational Note No. 3: For further information, see ISA-TR12.13.03, *Guide for Combustible Gas Detection as a Method of Protection*.

**(1) Inadequate Ventilation.** In a Class I, Zone 1 location that is so classified due to inadequate ventilation, electrical equipment suitable for Class I, Zone 2 locations shall be permitted. Combustible gas detection equipment shall be listed for Class I, Zone 1, for the appropriate material group, and for the detection of the specific gas or vapor to be encountered.

**(2) Interior of a Building.** In a building located in, or with an opening into, a Class I, Zone 2 location where the interior does not contain a source of flammable gas or vapor, electrical equipment for unclassified locations shall be permitted. Combustible gas detection equipment shall be listed for Class I, Zone 1 or Class I, Zone 2, for the appropriate material group, and for the detection of the specific gas or vapor to be encountered.

**(3) Interior of a Control Panel.** In the interior of a control panel containing instrumentation utilizing or measuring flammable liquids, gases, or vapors, electrical equipment suitable for Class I, Zone 2 locations shall be permitted. Combustible gas detection equipment shall be listed for Class I, Zone 1, for the appropriate material group, and for the detection of the specific gas or vapor to be encountered.

Similar to the use of gas detection equipment in Division 1 or 2 locations, detection equipment that is listed for the initial zone classification may permit the use of equipment classified for one zone lower.

## 505.9 Equipment

**(A) Suitability.** Suitability of identified equipment shall be determined by one of the following:

- (1) Equipment listing or labeling
- (2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
- (3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment

Informational Note: Additional documentation for equipment may include certificates demonstrating compliance with applicable equipment standards, indicating special conditions of use, and other pertinent information.

### (B) Listing.

- (1) Equipment that is listed for a Zone 0 location shall be permitted in a Zone 1 or Zone 2 location of the same

gas or vapor, provided that it is installed in accordance with the requirements for the marked type of protection. Equipment that is listed for a Zone 1 location shall be permitted in a Zone 2 location of the same gas or vapor, provided that it is installed in accordance with the requirements for the marked type of protection.

- (2) Equipment shall be permitted to be listed for a specific gas or vapor, specific mixtures of gases or vapors, or any specific combination of gases or vapors.

Informational Note: One common example is equipment marked for "IIB. + H2."

**(C) Marking.** Equipment shall be marked in accordance with 505.9(C)(1) or (C)(2).

**(1) Division Equipment.** Equipment identified for Class I, Division 1 or Class I, Division 2 shall, in addition to being marked in accordance with 500.8(C), be permitted to be marked with all of the following:

- (1) Class I, Zone 1 or Class I, Zone 2 (as applicable)
- (2) Applicable gas classification group(s) in accordance with Table 505.9(C)(1)(2)
- (3) Temperature classification in accordance with 505.9(D)(1)

**TABLE 505.9(C)(1)(2) Gas Classification Groups**

Gas Group	Comment
IIC	See 505.6(A)
IIB	See 505.6(B)
IIA	See 505.6(C)

**(2) Zone Equipment.** Equipment meeting one or more of the protection techniques described in 505.8 shall be marked with all of the following in the order shown:

- (1) Class
- (2) Zone
- (3) Symbol "AEx"
- (4) Protection technique(s) in accordance with Table 505.9(C)(2)(4)
- (5) Applicable gas classification group(s) in accordance with Table 505.9(C)(1)(2)
- (6) Temperature classification in accordance with 505.9(D)(1)

The symbol AEx identifies the equipment as meeting American standards. In European Common Market countries, the symbol is EEx. In the IEC standards, on which American and European standards are based, the symbol is Ex.

TABLE 505.9(C)(2)(4) Types of Protection Designation

Designation	Technique	Zone*
d	Flameproof enclosure	1
db	Flameproof enclosure	1
e	Increased safety	1
eb	Increased safety	1
ia	Intrinsic safety	0
ib	Intrinsic safety	1
ic	Intrinsic safety	2
[ia]	Associated apparatus	Unclassified**
[ib]	Associated apparatus	Unclassified**
[ic]	Associated apparatus	Unclassified**
m	Encapsulation	1
ma	Encapsulation	0
mb	Encapsulation	1
nA	Nonsparking equipment	2
nAc	Nonsparking equipment	2
nC	Sparkling equipment in which the contacts are suitably protected other than by restricted breathing enclosure	2
nCc	Sparkling equipment in which the contacts are suitably protected other than by restricted breathing enclosure	2
nR	Restricted breathing enclosure	2
nRc	Restricted breathing enclosure	2
o	Oil immersion	1
ob	Oil immersion	1
px	Pressurization	1
pxb	Pressurization	1
py	Pressurization	1
pyb	Pressurization	1
pz	Pressurization	2
pzc	Pressurization	2
q	Powder filled	1
qb	Powder filled	1

\*Does not address use where a combination of techniques is used.

\*\*Associated apparatus is permitted to be installed in a hazardous (classified) location if suitably protected using another type of protection.

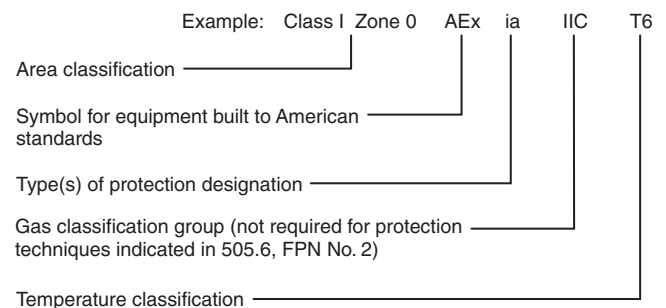

*Exception No. 1: Associated apparatus NOT suitable for installation in a hazardous (classified) location shall be required to be marked only with (3), (4), and (5), but BOTH the symbol AEx (3) and the symbol for the type of protection (4) shall be enclosed within the same square brackets, for example, [AEx ia] IIC.*

*Exception No. 2: Simple apparatus as defined in 504.2 shall not be required to have a marked operating temperature or temperature class.*

Electrical equipment of types of protection “e,” “m,” “ma,” “mb,” “px,” “py,” “pz,” or “q” shall be marked Group II. Electrical equipment of types of protection “d,” “ia,” “ib,”

“ic,” “[ia],” “[ib],” or “[ic]” shall be marked Group IIA, IIB, or IIC, or for a specific gas or vapor. Electrical equipment of types of protection “n” shall be marked Group II unless it contains enclosed-break devices, nonincendive components, or energy-limited equipment or circuits, in which case it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor. Electrical equipment of other types of protection shall be marked Group II unless the type of protection utilized by the equipment requires that it be marked Group IIA, IIB, or IIC, or a specific gas or vapor.

Informational Note No. 1: An example of the required marking for intrinsically safe apparatus for installation in Class I, Zone 0 is “Class I, Zone 0, AEx ia IIC T6.” An explanation of the marking that is required is shown in Informational Note Figure 505.9(C)(2).

#### INFORMATIONAL NOTE FIGURE 505.9(C)(2) Zone Equipment Marking.

Informational Note No. 2: An example of the required marking for intrinsically safe associated apparatus mounted in a flameproof enclosure for installation in Class I, Zone 1 is “Class I, Zone 1 AEx d[ia] IIC T4.”

Informational Note No. 3: An example of the required marking for intrinsically safe associated apparatus NOT for installation in a hazardous (classified) location is “[AEx ia] IIC.”

Informational Note No. 4: The EPL (or equipment protection level) may appear in the product marking. EPLs are designated as G for gas, D for dust, or M for mining and are then followed by a letter (a, b, or c) to give the user a better understanding as to whether the equipment provides either (a) a “very high,” (b) a “high,” or (c) an “enhanced” level of protection against ignition of an explosive atmosphere. For example, an AEx d IIC T4 motor (which is suitable by protection concept for application in Zone 1) may additionally be marked with an EPL of “Gb” to indicate that it was provided with a high level of protection, such as AEx d IIC T4 Gb.

Informational Note No. 5: Equipment installed outside a Zone 0 location, electrically connected to equipment located inside a Zone 0 location, may be marked Class I, Zone 0/1. The “/” indicates that equipment contains a separation element and can be installed at the boundary between a Zone 0 and a Zone 1 location. See ANSI/ISA-60079-26, *Electrical Apparatus for Use in Class I, Zone 0 Hazardous (Classified) Locations*.

**(D) Class I Temperature.** The temperature marking specified below shall not exceed the ignition temperature of the specific gas or vapor to be encountered.

Informational Note: For information regarding ignition temperatures of gases and vapors, see NFPA 497-2008, *Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*; and IEC 60079-20-1996, *Electrical Apparatus for Explosive Gas Atmospheres, Data for Flammable Gases and Vapours, Relating to the Use of Electrical Apparatus*.

**(1) Temperature Classifications.** Equipment shall be marked to show the operating temperature or temperature class referenced to a 40°C ambient, or at the higher ambient temperature if the equipment is rated and marked for an ambient temperature of greater than 40°C. The temperature class, if provided, shall be indicated using the temperature class (T Code) shown in Table 505.9(D)(1).

**TABLE 505.9(D)(1) Classification of Maximum Surface Temperature for Group II Electrical Equipment**

Temperature Class (T Code)	Maximum Surface Temperature (°C)
T1	≤450
T2	≤300
T3	≤200
T4	≤135
T5	≤100
T6	≤85

Electrical equipment designed for use in the ambient temperature range between –20°C and +40°C shall require no ambient temperature marking.

Electrical equipment that is designed for use in a range of ambient temperatures other than –20°C to +40°C is considered to be special; and the ambient temperature range shall then be marked on the equipment, including either the symbol “Ta” or “Tamb” together with the special range of ambient temperatures, in degrees Celsius.

Informational Note: As an example, such a marking might be “–30°C to +40°C.”

*Exception No. 1: Equipment of the non-heat-producing type, such as conduit fittings, and equipment of the heat-producing type having a maximum temperature of not more than 100°C (212°F) shall not be required to have a marked operating temperature or temperature class.*

*Exception No. 2: Equipment identified for Class I, Division 1 or Division 2 locations as permitted by 505.20(B) and (D)*

*shall be permitted to be marked in accordance with 500.8(C) and Table 500.8(C).*

**(E) Threading.** The supply connection entry thread form shall be NPT or metric. Conduit and fittings shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosionproof or flameproof integrity of the conduit system where applicable. Equipment provided with threaded entries for field wiring connections shall be installed in accordance with 505.9(E)(1) or (E)(2) and with (E)(3).

**(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings.** For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used.

All NPT threaded conduit and fittings referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) thread.

NPT threaded entries into explosionproof or flameproof equipment shall be made up with at least five threads fully engaged.

*Exception: For listed explosionproof or flameproof equipment, factory threaded NPT entries shall be made up with at least 4½ threads fully engaged.*

Informational Note No. 1: Thread specifications for male NPT threads are located in ANSI/ASME B1.20.1-1983, *Pipe Threads, General Purpose (Inch)*.

Informational Note No. 2: Female NPT threaded entries use a modified National Standard Pipe Taper (NPT) thread with thread form per ANSI/ASME B1.20.1-1983, *Pipe Threads, General Purpose (Inch)*. See ANSI UL/ISA 60079-1, *Electrical Apparatus for Explosive Gas Atmospheres – Part 1: Flameproof Enclosures “d”*.

**(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings.** For equipment with metric threaded entries, listed conduit fittings or listed cable fittings shall be used. Such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT threaded fittings shall be provided with the equipment and shall be used for connection to conduit or NPT threaded fittings.

Metric threaded entries into explosionproof or flameproof equipment shall have a class of fit of at least 6g/6H and be made up with at least five threads fully engaged for Groups C, D, IIB, or IIA and not less than eight threads fully engaged for Groups A, B, IIC, or IIB + H<sub>2</sub>.

Informational Note: Threading specifications for metric threaded entries are located in ISO 965/1-1980, *ISO general purpose metric screw threads — Tolerances — Part 1: Principles and basic data*, and ISO 965-3-1998, *ISO general purpose metric screw threads — Tolerances — Part 3: De-*

viations for constructional screw threads; and ISO 965/3-1980, *Metric Screw Threads*.

Listed fittings must be used with metric threaded entries to assure the integrity of the conduit system. In addition, either the entries must be identified as being metric or adapters must be provided for making connection to NPT fittings. See the commentary following the informational note to 500.8(E)(2) for information on metric threads. Exhibit 505.2 is an example of an adapter that provides a means of connecting conduit or fitting with NPT threads to a Type “e” (increased safety) enclosure that has metric threads.

**EXHIBIT 505.2** A typical hub providing an NPT-threaded entry for conduit or cable into an increased safety enclosure. (Courtesy of Cooper Crouse-Hinds)

**(3) Unused Openings.** All unused openings shall be closed with close-up plugs listed for the location and shall maintain the type of protection. The plug engagement shall comply with 505.9(E)(1) or 505.9(E)(2).

**(F) Optical Fiber Cables.** Where an optical fiber cable contains conductors that are capable of carrying current (composite optical fiber cable), the optical fiber cable shall be installed in accordance with the requirements of Articles 505.15 and 505.16.

## 505.15 Wiring Methods

Wiring methods shall maintain the integrity of protection techniques and shall comply with 505.15(A) through (C).

**(A) Class I, Zone 0.** In Class I, Zone 0 locations, only intrinsically safe wiring methods in accordance with Article 504 shall be permitted.

Informational Note: Article 504 only includes protection technique “ia.”

This provision is one of the most significant differences between the zone and division area classification requirements. The degree of hazard within a Zone 0 area is considered so severe that all wiring in this area must be intrinsically safe (technique “ia”). In general, only instrumentation and signaling circuits installed in accordance with Article 504 can be used in a Zone 0 area. Explosionproof power utilization equipment, such as motors and luminaires, is not permitted in Class I, Zone 0 locations.

### (B) Class I, Zone 1.

**(1) General.** In Class I, Zone 1 locations, the wiring methods in (B)(1)(a) through (B)(1)(f) shall be permitted.

(a) All wiring methods permitted by 505.15(A).

(b) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the application.

Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type ITC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material, and terminated with fittings listed for the application. Type ITC-HL cable shall be installed in accordance with the provisions of Article 727.

Informational Note: See 727.4 and 727.5 for restrictions on use of Type ITC cable.

(d) Type MI cable terminated with fittings listed for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(e) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

(f) Type PVC conduit and Type RTRC conduit shall be permitted where encased in a concrete envelope a minimum

of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non-current-carrying metal parts.

**(2) Flexible Connections.** Where necessary to employ flexible connections, flexible fittings listed for Class I, Zone 1 or Division 1 locations, or flexible cord in accordance with the provisions of 505.17 terminated with a listed cord connector that maintains the type of protection of the terminal compartment, shall be permitted.

### (C) Class I, Zone 2.

**(1) General.** In Class I, Zone 2 locations, the following wiring methods shall be permitted.

(a) All wiring methods permitted by 505.15(B).

(b) Types MC, MV, or TC cable, including installation in cable tray systems. The cable shall be terminated with listed fittings. Single conductor Type MV cables shall be shielded or metallic-armored.

(c) Type ITC and Type ITC-ER cable as permitted in 727.4 and terminated with listed fittings.

(d) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, including installation in cable tray systems. The cable shall be terminated with listed fittings.

(e) Enclosed gasketed busways, enclosed gasketed wireways.

(f) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where metallic conduit does not provide sufficient corrosion resistance, listed reinforced thermosetting resin conduit (RTRC), factory elbows, and associated fittings, all marked with the suffix -XW, and Schedule 80 PVC conduit, factory elbows, and associated fittings shall be permitted. Where seals are required for boundary conditions as defined in 505.16(C)(1)(b), the Zone 1 wiring method shall extend into the Zone 2 area to the seal, which shall be located on the Zone 2 side of the Zone 1–Zone 2 boundary.

(g) Intrinsic safety type of protection “ic” shall be permitted using any of the wiring methods permitted for unclassified locations. Intrinsic safety type of protection “ic” systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control

drawing, shall be permitted in an intrinsic safety type of protection “ic” circuit, provided the simple apparatus does not interconnect the intrinsic safety type of protection “ic” systems to any other circuit.

Informational Note: Simple apparatus is defined in 504.2.

Separate intrinsic safety type of protection “ic” systems shall be installed in accordance with one of the following:

- (1) In separate cables
- (2) In multiconductor cables where the conductors of each circuit are within a grounded metal shield
- (3) In multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.)

**(2) Flexible Connections.** Where provision must be made for limited flexibility, flexible metal fittings, flexible metal conduit with listed fittings, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord in accordance with the provisions of 505.17 terminated with a listed cord connector that maintains the type of protection of the terminal compartment shall be permitted.

Informational Note: See 505.25(B) for grounding requirements where flexible conduit is used.

## 505.16 Sealing and Drainage

See the associated commentary to 501.15 for further information regarding conduit and cable sealing for hazardous locations.

Seals in conduit and cable systems shall comply with 505.16(A) through (E). Sealing compound shall be used in Type MI cable termination fittings to exclude moisture and other fluids from the cable insulation.

Informational Note No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal and through conductors passing through the seal. See 505.16(C)(2)(b). Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. See 505.16(D)(2).

Informational Note No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the strands of standard stranded conductors larger than

2 AWG. Special conductor constructions, for example, compacted strands or sealing of the individual strands, are means of reducing leakage and preventing the propagation of flames.

**(A) Zone 0.** In Class I, Zone 0 locations, seals shall be located according to 505.16(A)(1), (A)(2), and (A)(3).

**(1) Conduit Seals.** Seals shall be provided within 3.05 m (10 ft) of where a conduit leaves a Zone 0 location. There shall be no unions, couplings, boxes, or fittings, except listed reducers at the seal, in the conduit run between the seal and the point at which the conduit leaves the location.

*Exception:* A rigid unbroken conduit that passes completely through the Zone 0 location with no fittings less than 300 mm (12 in.) beyond each boundary shall not be required to be sealed if the termination points of the unbroken conduit are in unclassified locations.

**(2) Cable Seals.** Seals shall be provided on cables at the first point of termination after entry into the Zone 0 location.

**(3) Not Required to Be Explosionproof or Flameproof.** Seals shall not be required to be explosionproof or flameproof.

**(B) Zone 1.** In Class I, Zone 1 locations, seals shall be located in accordance with 505.16(B)(1) through (B)(8).

**(1) Type of Protection “d” or “e” Enclosures.** Conduit seals shall be provided within 50 mm (2 in.) for each conduit entering enclosures having type of protection “d” or “e.”

*Exception No. 1:* Where the enclosure having type of protection “d” is marked to indicate that a seal is not required.

*Exception No. 2:* For type of protection “e,” conduit and fittings employing only NPT to NPT raceway joints or fittings listed for type of protection “e” shall be permitted between the enclosure and the seal, and the seal shall not be required to be within 50 mm (2 in.) of the entry.

Informational Note: Examples of fittings employing other than NPT threads include conduit couplings, capped elbows, unions, and breather drains.

*Exception No. 3:* For conduit installed between type of protection “e” enclosures employing only NPT to NPT raceway joints or conduit fittings listed for type of protection “e,” a seal shall not be required.

**(2) Explosionproof Equipment.** Conduit seals shall be provided for each conduit entering explosionproof equipment according to (B)(2)(a), (B)(2)(b), and (B)(2)(c).

(a) In each conduit entry into an explosionproof enclosure where either (1) the enclosure contains apparatus, such as switches, circuit breakers, fuses, relays, or resistors, that may produce arcs, sparks, or high temperatures that are considered to be an ignition source in normal operation, or (2) the entry is metric designator 53 (trade size 2) or larger and the enclosure contains terminals, splices, or taps. For the purposes of this section, high temperatures shall be considered to be any temperatures exceeding 80 percent of the autoignition temperature in degrees Celsius of the gas or vapor involved.

*Exception:* Conduit entering an enclosure where such switches, circuit breakers, fuses, relays, or resistors comply with one of the following:

- (1) Are enclosed within a chamber hermetically sealed against the entrance of gases or vapors.
- (2) Are immersed in oil.
- (3) Are enclosed within a factory-sealed explosionproof chamber located within the enclosure, identified for the location, and marked “factory sealed” or equivalent, unless the entry is metric designator 53 (trade size 2) or larger. Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure that is required to have a conduit seal.

(b) Conduit seals shall be installed within 450 mm (18 in.) from the enclosure. Only explosionproof unions, couplings, reducers, elbows, capped elbows, and conduit bodies similar to L, T, and cross types that are not larger than the trade size of the conduit shall be permitted between the sealing fitting and the explosionproof enclosure.

(c) Where two or more explosionproof enclosures for which conduit seals are required under 505.16(B)(2) are connected by nipples or by runs of conduit not more than 900 mm (36 in.) long, a single conduit seal in each such nipple connection or run of conduit shall be considered sufficient if located not more than 450 mm (18 in.) from either enclosure.

**(3) Pressurized Enclosures.** Conduit seals shall be provided in each conduit entry into a pressurized enclosure where the conduit is not pressurized as part of the protection system. Conduit seals shall be installed within 450 mm (18 in.) from the pressurized enclosure.

Informational Note No. 1: Installing the seal as close as possible to the enclosure reduces problems with purging the dead airspace in the pressurized conduit.

Informational Note No. 2: For further information, see NFPA 496-2008, *Standard for Purged and Pressurized Enclosures for Electrical Equipment*.

**(4) Class I, Zone 1 Boundary.** Conduit seals shall be provided in each conduit run leaving a Class I, Zone 1 location.

The sealing fitting shall be permitted on either side of the boundary of such location within 3.05 m (10 ft) of the boundary and shall be designed and installed so as to minimize the amount of gas or vapor within the Zone 1 portion of the conduit from being communicated to the conduit beyond the seal. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Zone 1 location.

*Exception: Metal conduit containing no unions, couplings, boxes, or fittings and passing completely through a Class I, Zone 1 location with no fittings less than 300 mm (12 in.) beyond each boundary shall not require a conduit seal if the termination points of the unbroken conduit are in unclassified locations.*

**(5) Cables Capable of Transmitting Gases or Vapors.**

Conduits containing cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Zone 1 location after removing the jacket and any other coverings so that the sealing compound surrounds each individual insulated conductor and the outer jacket.

*Exception: Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be permitted to be considered as a single conductor by sealing the cable in the conduit within 450 mm (18 in.) of the enclosure and the cable end within the enclosure by an approved means to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved methods. For shielded cables and twisted pair cables, it shall not be required to remove the shielding material or separate the twisted pair.*

**(6) Cables Incapable of Transmitting Gases or Vapors.** Each multiconductor cable in conduit shall be considered as a single conductor if the cable is incapable of transmitting gases or vapors through the cable core. These cables shall be sealed in accordance with 505.16(D).

**(7) Cables Entering Enclosures.** Cable seals shall be provided for each cable entering flameproof or explosionproof enclosures. The seal shall comply with 505.16(D).

**(8) Class I, Zone 1 Boundary.** Cables shall be sealed at the point at which they leave the Zone 1 location.

*Exception: Where cable is sealed at the termination point.*

**(C) Zone 2.** In Class I, Zone 2 locations, seals shall be located in accordance with 505.16(C)(1) and (C)(2).

**(1) Conduit Seals.** Conduit seals shall be located in accordance with (C)(1)(a) and (C)(1)(b).

(a) For connections to enclosures that are required to be flameproof or explosionproof, a conduit seal shall be provided in accordance with 505.16(B)(1) and (B)(2). All portions of the conduit run or nipple between the seal and such enclosure shall comply with 505.16(B).

(b) In each conduit run passing from a Class I, Zone 2 location into an unclassified location. The sealing fitting shall be permitted on either side of the boundary of such location within 3.05 m (10 ft) of the boundary and shall be designed and installed so as to minimize the amount of gas or vapor within the Zone 2 portion of the conduit from being communicated to the conduit beyond the seal. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the Zone 2 location, and a threaded connection shall be used at the sealing fitting. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Zone 2 location. **Conduits shall be sealed to minimize the amount of gas or vapor within the Class I, Zone 2 portion of the conduit from being communicated to the conduit beyond the seal. Such seals shall not be required to be flameproof or explosionproof but shall be identified for the purpose of minimizing passage of gases under normal operating conditions and shall be accessible.**

*Exception No. 1: Metal conduit containing no unions, couplings, boxes, or fittings and passing completely through a Class I, Zone 2 location with no fittings less than 300 mm (12 in.) beyond each boundary shall not be required to be sealed if the termination points of the unbroken conduit are in unclassified locations.*

*Exception No. 2: Conduit systems terminating at an unclassified location where a wiring method transition is made to cable tray, cablebus, ventilated busway, Type MI cable, or cable that is not installed in a raceway or cable tray system shall not be required to be sealed where passing from the Class I, Zone 2 location into the unclassified location. The unclassified location shall be outdoors or, if the conduit system is all in one room, it shall be permitted to be indoors. The conduits shall not terminate at an enclosure containing an ignition source in normal operation.*

*Exception No. 3: Conduit systems passing from an enclosure or room that is unclassified as a result of pressurization into a Class I, Zone 2 location shall not require a seal at the boundary.*

Informational Note: For further information, refer to NFPA 496-2008, *Standard for Purged and Pressurized Enclosures for Electrical Equipment*.

*Exception No. 4: Segments of aboveground conduit systems shall not be required to be sealed where passing from a Class I, Zone 2 location into an unclassified location if all the following conditions are met:*

- (1) *No part of the conduit system segment passes through a Zone 0 or Zone 1 location where the conduit contains unions, couplings, boxes, or fittings within 300 mm (12 in.) of the Zone 0 or Zone 1 location.*
- (2) *The conduit system segment is located entirely in outdoor locations.*
- (3) *The conduit system segment is not directly connected to canned pumps, process or service connections for flow, pressure, or analysis measurement, and so forth, that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the conduit system.*
- (4) *The conduit system segment contains only threaded metal conduit, unions, couplings, conduit bodies, and fittings in the unclassified location.*
- (5) *The conduit system segment is sealed at its entry to each enclosure or fitting housing terminals, splices, or taps in Zone 2 locations.*

**(2) Cable Seals.** Cable seals shall be located in accordance with (C)(2)(a), (C)(2)(b), and (C)(2)(c).

(a) *Explosionproof and Flameproof Enclosures.* Cables entering enclosures required to be flameproof or explosionproof shall be sealed at the point of entrance. The seal shall comply with 505.16(D). Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Zone 2 location after removing the jacket and any other coverings so that the sealing compound surrounds each individual insulated conductor in such a manner as to minimize the passage of gases and vapors. Multiconductor cables in conduit shall be sealed as described in 505.16(B)(4).

*Exception No. 1: Cables passing from an enclosure or room that is unclassified as a result of Type Z pressurization into a Zone 2 location shall not require a seal at the boundary.*

*Exception No. 2: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs, provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.*

(b) *Cables That Will Not Transmit Gases or Vapors.* Cables with a gas/vaportight continuous sheath and that will not transmit gases or vapors through the cable core in excess of the quantity permitted for seal fittings shall not be required to be sealed except as required in 505.16(C)(2)(a).

The minimum length of such cable run shall not be less than the length that limits gas or vapor flow through the cable core to the rate permitted for seal fittings [200 cm<sup>3</sup>/hr (0.007 ft<sup>3</sup>/hr) of air at a pressure of 1500 pascals (6 in. of water)].

Informational Note No. 1: For further information on construction, testing, and marking requirements for conduit sealing fittings, see ANSI/UL 1203, *Explosionproof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations*.

Informational Note No. 2: The cable core does not include the interstices of the conductor strands.

(c) *Cables Capable of Transmitting Gases or Vapors.* Cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall not be required to be sealed except as required in 505.16(C)(2)(a), unless the cable is attached to process equipment or devices that may cause a pressure in excess of 1500 pascals (6 in. of water) to be exerted at a cable end, in which case a seal, barrier, or other means shall be provided to prevent migration of flammables into an unclassified area.

*Exception: Cables with an unbroken gas/vaportight continuous sheath shall be permitted to pass through a Class I, Zone 2 location without seals.*

(d) *Cables Without Gas/Vaportight Continuous Sheath.* Cables that do not have gas/vaportight continuous sheath shall be sealed at the boundary of the Zone 2 and unclassified location in such a manner as to minimize the passage of gases or vapors into an unclassified location.

Informational Note: The cable sheath may be either metal or a nonmetallic material.

**(D) Class I, Zones 0, 1, and 2.** Where required, seals in Class I, Zones 0, 1, and 2 locations shall comply with 505.16(D)(1) through (D)(5).

**(1) Fittings.** Enclosures for connections or equipment shall be provided with an integral means for sealing, or sealing fittings listed for the location shall be used. Sealing fittings shall be listed for use with one or more specific compounds and shall be accessible.

**(2) Compound.** The compound shall provide a seal against passage of gas or vapors through the seal fitting, shall not be affected by the surrounding atmosphere or liquids, and shall not have a melting point less than 93°C (200°F).

**(3) Thickness of Compounds.** In a completed seal, the minimum thickness of the sealing compound shall not be less than the trade size of the sealing fitting and, in no case, less than 16 mm (5/8 in.).

*Exception: Listed cable sealing fittings shall not be required to have a minimum thickness equal to the trade size of the fitting.*

**(4) Splices and Taps.** Splices and taps shall not be made in fittings intended only for sealing with compound, nor shall other fittings in which splices or taps are made be filled with compound.

**(5) Conductor Fill.** The cross-sectional area of the conductors permitted in a seal shall not exceed 25 percent of the cross-sectional area of a rigid metal conduit of the same trade size unless it is specifically listed for a higher percentage of fill.

#### **(E) Drainage.**

**(1) Control Equipment.** Where there is a probability that liquid or other condensed vapor may be trapped within enclosures for control equipment or at any point in the raceway system, approved means shall be provided to prevent accumulation or to permit periodic draining of such liquid or condensed vapor.

**(2) Motors and Generators.** Where the authority having jurisdiction judges that there is a probability that liquid or condensed vapor may accumulate within motors or generators, joints and conduit systems shall be arranged to minimize entrance of liquid. If means to prevent accumulation or to permit periodic draining are judged necessary, such means shall be provided at the time of manufacture and shall be considered an integral part of the machine.

### **505.17 Flexible Cords, Class I, Zones 1 and 2**

A flexible cord shall be permitted for connection between portable lighting equipment or other portable utilization equipment and the fixed portion of their supply circuit. Flexible cord shall also be permitted for that portion of the circuit where the fixed wiring methods of 505.15(B) cannot provide the necessary degree of movement for fixed and mobile electrical utilization equipment, in an industrial establishment where conditions of maintenance and engineering supervision ensure that only qualified persons install and service the installation, and the flexible cord is protected by location or by a suitable guard from damage. The length of the flexible cord shall be continuous. Where flexible cords are used, the cords shall comply with the following:

- (1) Be of a type listed for extra-hard usage
- (2) Contain, in addition to the conductors of the circuit, an equipment grounding conductor complying with 400.23
- (3) Be connected to terminals or to supply conductors in an approved manner

- (4) Be supported by clamps or by other suitable means in such a manner that there will be no tension on the terminal connections
- (5) Be terminated with a listed cord connector that maintains the type of protection where the flexible cord enters boxes, fittings, or enclosures that are required to be explosionproof or flameproof
- (6) Cord entering an increased safety “e” enclosure shall be terminated with a listed increased safety “e” cord connector.

Informational Note: See 400.7 for permitted uses of flexible cords.

Electric submersible pumps with means for removal without entering the wet-pit shall be considered portable utilization equipment. The extension of the flexible cord within a suitable raceway between the wet-pit and the power source shall be permitted.

Electric mixers intended for travel into and out of open-type mixing tanks or vats shall be considered portable utilization equipment.

Informational Note: See 505.18 for flexible cords exposed to liquids having a deleterious effect on the conductor insulation.

### **505.18 Conductors and Conductor Insulation**

**(A) Conductors.** For type of protection “e,” field wiring conductors shall be copper. Every conductor (including spares) that enters Type “e” equipment shall be terminated at a Type “e” terminal.

**(B) Conductor Insulation.** Where condensed vapors or liquids may collect on, or come in contact with, the insulation on conductors, such insulation shall be of a type identified for use under such conditions, or the insulation shall be protected by a sheath of lead or by other approved means.

### **505.19 Uninsulated Exposed Parts**

There shall be no uninsulated exposed parts, such as electrical conductors, buses, terminals, or components that operate at more than 30 volts (15 volts in wet locations). These parts shall additionally be protected by type of protection ia, ib, or nA that is suitable for the location.

### **505.20 Equipment Requirements**

**(A) Zone 0.** In Class I, Zone 0 locations, only equipment specifically listed and marked as suitable for the location shall be permitted.

*Exception: Intrinsically safe apparatus listed for use in Class I, Division 1 locations for the same gas, or as permit-*

ted by 505.9(B)(2), and with a suitable temperature class shall be permitted.

This exception results from the fact that ANSI/UL 913, the standard used to evaluate IS systems for Class I, Division 1 locations, is based on the IEC requirements for intrinsically safe equipment for Class I, Zone 0 locations.

**(B) Zone 1.** In Class I, Zone 1 locations, only equipment specifically listed and marked as suitable for the location shall be permitted.

*Exception No. 1: Equipment identified for use in Class I, Division 1 or listed for use in Zone 0 locations for the same gas, or as permitted by 505.9(B)(2), and with a suitable temperature class shall be permitted.*

*Exception No. 2: Equipment identified for Class I, Zone 1 or Zone 2 type of protection “p” shall be permitted.*

**(C) Zone 2.** In Class I, Zone 2 locations, only equipment specifically listed and marked as suitable for the location shall be permitted.

*Exception No. 1: Equipment listed for use in Zone 0 or Zone 1 locations for the same gas, or as permitted by 505.9(B)(2), and with a suitable temperature class, shall be permitted.*

*Exception No. 2: Equipment identified for Class I, Zone 1 or Zone 2 type of protection “p” shall be permitted.*

*Exception No. 3: Equipment identified for use in Class I, Division 1 or Division 2 locations for the same gas, or as permitted by 505.9(B)(2), and with a suitable temperature class shall be permitted.*

*Exception No. 4: In Class I, Zone 2 locations, the installation of open or nonexplosionproof or nonflameproof enclosed motors, such as squirrel-cage induction motors without brushes, switching mechanisms, or similar arc-producing devices that are not identified for use in a Class I, Zone 2 location shall be permitted.*

Informational Note No. 1: It is important to consider the temperature of internal and external surfaces that may be exposed to the flammable atmosphere.

Informational Note No. 2: It is important to consider the risk of ignition due to currents arcing across discontinuities and overheating of parts in multisection enclosures of large motors and generators. Such motors and generators may need equipotential bonding jumpers across joints in the enclosure and from enclosure to ground. Where the presence of ignitable gases or vapors is suspected, clean air purging may be needed immediately prior to and during start-up periods.

The informational notes identify unique issues that apply to motors in Class I, Zone 2 locations. High inertia loads can cause increased rotor heating during starting, and sparking can occur between motor housing assemblies when starting. See Exhibits 501.18 and 501.19 and the accompanying commentary for more information on electric motors installed in hazardous locations.

**(D) Manufacturer’s Instructions.** Electrical equipment installed in hazardous (classified) locations shall be installed in accordance with the instructions (if any) provided by the manufacturer.

### 505.21 Multiwire Branch Circuits

In a Class I, Zone 1 location, a multiwire branch circuit shall not be permitted.

*Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.*

## 505.22 Increased Safety “e” Motors and Generators

In Class I, Zone 1 locations, Increased Safety “e” motors and generators of all voltage ratings shall be listed for Zone 1 locations, and shall comply with all of the following:

- (1) Motors shall be marked with the current ratio,  $I_A/I_N$ , and time,  $t_E$ .
- (2) Motors shall have controllers marked with the model or identification number, output rating (horsepower or kilowatt), full-load amperes, starting current ratio ( $I_A/I_N$ ), and time ( $t_E$ ) of the motors that they are intended to protect; the controller marking shall also include the specific overload protection type (and setting, if applicable) that is listed with the motor or generator.
- (3) Connections shall be made with the specific terminals listed with the motor or generator.
- (4) Terminal housings shall be permitted to be of substantial, nonmetallic, nonburning material, provided an internal grounding means between the motor frame and the equipment grounding connection is incorporated within the housing.
- (5) The provisions of Part III of Article 430 shall apply regardless of the voltage rating of the motor.
- (6) The motors shall be protected against overload by a separate overload device that is responsive to motor current. This device shall be selected to trip or shall be rated in accordance with the listing of the motor and its overload protection.
- (7) Sections 430.32(C) and 430.44 shall not apply to such motors.

- (8) The motor overload protection shall not be shunted or cut out during the starting period.

### 505.25 Grounding and Bonding

Grounding and bonding shall comply with Article 250 and the requirements in 505.25(A) and (B).

**(A) Bonding.** The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, and so forth, between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.

*Exception: The specific bonding means shall be required only to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in 250.32(B), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means.*

Informational Note: See 250.100 for additional bonding requirements in hazardous (classified) locations.

**(B) Types of Equipment Grounding Conductors.** Flexible metal conduit and liquidtight flexible metal conduit shall include an equipment bonding jumper of the wire type in compliance with 250.102.

*Exception: In Class I, Zone 2 locations, the bonding jumper shall be permitted to be deleted where all of the following conditions are met:*

- (a) Listed liquidtight flexible metal conduit 1.8 m (6 ft) or less in length, with fittings listed for grounding, is used.
- (b) Overcurrent protection in the circuit is limited to 10 amperes or less.
- (c) The load is not a power utilization load.

The grounding and bonding requirements for the zone classification system are identical to those for the division classification system. For information on grounding and bonding requirements in Class I locations, see the commentary following 501.30(A) and (B).

### 505.26 Process Sealing.

This section shall apply to process-connected equipment, which includes, but is not limited to, canned pumps, sub-

mersible pumps, flow, pressure, temperature, or analysis measurement instruments. A process seal is a device to prevent the migration of process fluids from the designed containment into the external electrical system. Process connected electrical equipment that incorporates a single process seal, such as a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering a conduit or cable system capable of transmitting fluids, shall be provided with an additional means to mitigate a single process seal failure. The additional means may include, but is not limited to the following:

- (1) A suitable barrier meeting the process temperature and pressure conditions that the barrier is subjected to upon failure of the single process seal. There shall be a vent or drain between the single process seal and the suitable barrier. Indication of the single process seal failure shall be provided by visible leakage, an audible whistle, or other means of monitoring.
- (2) A listed Type MI cable assembly, rated at not less than 125 percent of the process pressure and not less than 125 percent of the maximum process temperature (in degrees Celsius), installed between the cable or conduit and the single process seal.
- (3) A drain or vent located between the single process seal and a conduit or cable seal. The drain or vent shall be sufficiently sized to prevent overpressuring the conduit or cable seal above 6 in. water column (1493 Pa). Indication of the single process seal failure shall be provided by visible leakage, an audible whistle, or other means of monitoring.

Process-connected electrical equipment that does not rely on a single process seal or is listed and marked “single seal” or “dual seal” shall not be required to be provided with an additional means of sealing.

Informational Note: For construction and testing requirements for process sealing for listed and marked “single seal” or “dual seal” requirements, refer to ANSI/ISA-12.27.01-2003, *Requirements for Process Sealing Between Electrical Systems and Potentially Flammable or Combustible Process Fluids*.

The requirements for process sealing clarify the sealing, venting, and primary seal failure indication methods for the additional process seal. See the commentary following 501.17 for further information on process sealing.

506.21 Multiwire Branch Circuits

506.25 Grounding and Bonding

(A) Bonding

(B) Types of Equipment Grounding Conductors

Informational Note: Text that is followed by a reference in brackets has been extracted from NFPA 499-2008, *Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installation in Chemical Process Areas*. Only editorial changes were made to the extracted text to make it consistent with this *Code*.

#### 506.1 Scope

This article covers the requirements for the zone classification system as an alternative to the division classification system covered in Article 500, Article 502, and Article 503 for electrical and electronic equipment and wiring for all voltages in Zone 20, Zone 21, and Zone 22 hazardous (classified) locations where fire and explosion hazards may exist due to combustible dusts or ignitable fibers/flyings. Combustible metallic dusts are not covered by the requirements of this article.

Just as in the division hazardous location classification scheme, the zone classification scheme also addresses combustible dusts and ignitable fibers/flyings. Zones 20, 21, and 22 are analogous to both Class II and III, Division 1 and 2 hazardous locations in Articles 502 and 503.

Combustible metals dusts (Group E in Class II locations) are not covered by the requirements of Article 506. Similar to Class III, Division 1 and 2 locations, ignitable fibers/flyings for zone classifications also do not include group designations. However, unlike the Group F and G designations under Class II locations, the zone classification does not further subdivide combustible dusts into groups. Hazardous locations containing combustible dusts or ignitable fibers/flyings are subdivided into Zone 20, 21, or 22 based on the likelihood of the presence of the material, not by the type of material present.

Informational Note No. 1: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Division 1 or Division 2; Class II, Division 1 or Division 2; Class III, Division 1 or Division 2; and Class I, Zone 0 or Zone 1 or Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors, flammable liquids, or combustible dusts or fibers, refer to Articles 500 through 505.

Informational Note No. 2: Zone 20, Zone 21, and Zone 22 area classifications are based on the modified IEC area classification system as defined in [ANSI/ISA-61241-10](#)

(12.10.05)-2004, *Electrical Apparatus for Use in Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations — Classification of Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations*.

Informational Note No. 3: The unique hazards associated with explosives, pyrotechnics, and blasting agents are not addressed in this article.

## 506.2 Definitions

For purposes of this article, the following definitions apply.

**Associated Nonincendive Field Wiring Apparatus.** Apparatus in which the circuits are not necessarily nonincendive themselves but that affect the energy in nonincendive field wiring circuits and are relied upon to maintain nonincendive energy levels. Associated nonincendive field wiring apparatus may be either of the following:

- (1) Electrical apparatus that has an alternative type of protection for use in the appropriate hazardous (classified) location
- (2) Electrical apparatus not so protected that shall not be used in a hazardous (classified) location

Informational Note: Associated nonincendive field wiring apparatus has designated associated nonincendive field wiring apparatus connections for nonincendive field wiring apparatus and may also have connections for other electrical apparatus.

**Combustible Dust.** Any finely divided solid material that is 420 microns (0.017 in.) or smaller in diameter (material passing a U.S. No. 40 Standard Sieve) and presents a fire or explosion hazard when dispersed and ignited in air. [499: 3.3.3]

**Dust-Ignitionproof.** Equipment enclosed in a manner that excludes dusts and does not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure.

Informational Note: For further information on dust-ignitionproof enclosures, see Type 9 enclosure in ANSI/NEMA 250-1991, *Enclosures for Electrical Equipment*, and ANSI/UL 1203-1994, *Explosionproof and Dust-Ignitionproof Electrical Equipment for Hazardous (Classified) Locations*.

**Dusttight.** Enclosures constructed so that dust will not enter under specified test conditions.

**Nonincendive Circuit.** A circuit, other than field wiring, in which any arc or thermal effect produced under intended operating conditions of the equipment is not capable, under specified test conditions, of igniting the flammable gas–air, vapor–air, or dust–air mixture.

Informational Note: Conditions are described in ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for*

*Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations*.

**Nonincendive Equipment.** Equipment having electrical/electronic circuitry that is incapable, under normal operating conditions, of causing ignition of a specified flammable gas–air, vapor–air, or dust–air mixture due to arcing or thermal means.

Informational Note: Conditions are described in ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations*.

**Nonincendive Field Wiring.** Wiring that enters or leaves an equipment enclosure and, under normal operating conditions of the equipment, is not capable, due to arcing or thermal effects, of igniting the flammable gas–air, vapor–air, or dust–air mixture. Normal operation includes opening, shorting, or grounding the field wiring.

**Nonincendive Field Wiring Apparatus.** Apparatus intended to be connected to nonincendive field wiring.

Informational Note: Conditions are described in ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations*.

**Pressurized.** The process of supplying an enclosure with a protective gas with or without continuous flow at sufficient pressure to prevent the entrance of combustible dust or ignitable fibers/flyings.

Informational Note: For further information, see ANSI/NFPA 496-2008, *Standard for Purged and Pressurized Enclosures for Electrical Equipment*.

**Protection by Encapsulation “mD.”** Type of protection where electrical parts that could cause ignition of a mixture of combustible dust or fibers/flyings in air are protected by enclosing them in a compound in such a way that the explosive atmosphere cannot be ignited.

Informational Note No. 1: For additional information, see ANSI/ISA-61241-18 (12.10.07)-2006, *Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations — Protection by Encapsulation “mD”*.

Informational Note No. 2: Encapsulation is designated level of protection “maD” for use in Zone 20 locations. Encapsulation is designated level of protection “mbD” for use in Zone 21 locations.

**Protection by Enclosure “tD.”** Type of protection for explosive dust atmospheres where electrical apparatus is provided with an enclosure providing dust ingress protection and a means to limit surface temperatures.

Informational Note: For additional information, see ANSI/ISA-61241-0 (12.10.02)-2006, *Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations — General Requirement*, and ANSI/ISA-61241-1 (12.10.03)-2006, *Electrical Apparatus for Use in Zone 21*

and Zone 22 Hazardous (Classified) Locations — Protection by Enclosure “iD”.

**Protection by Intrinsic Safety “iD.”** Type of protection where any spark or thermal effect is incapable of causing ignition of a mixture of combustible dust, fibers, or flyings in air under prescribed test conditions.

Informational Note: For additional information, see [ANSI/ISA-61241-11 \(12.10.04\)](#), *Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations — Protection by Intrinsic Safety “iD.”*

**Protection by Pressurization “pD.”** Type of protection that guards against the ingress of a mixture of combustible dust or fibers/flyings in air into an enclosure containing electrical equipment by providing and maintaining a protective gas atmosphere inside the enclosure at a pressure above that of the external atmosphere.

Informational Note: For additional information, see [ANSI/ISA-61241-2 \(12.10.06\)](#), *Electrical Apparatus for Use in Zone 21 and Zone 22 Hazardous (Classified) Locations — Protection by Pressurization “pD.”*

**Zone 20 Hazardous (Classified) Location.** An area where combustible dust or ignitable fibers/flyings are present continuously or for long periods of time in quantities sufficient to be hazardous, as classified by 506.5(B)(1).

**Zone 21 Hazardous (Classified) Location.** An area where combustible dust or ignitable fibers/flyings are likely to exist occasionally under normal operation in quantities sufficient to be hazardous, as classified by 506.5(B)(2).

**Zone 22 Hazardous (Classified) Location.** An area where combustible dust or ignitable fibers/flyings are not likely to occur under normal operation in quantities sufficient to be hazardous, as classified by 506.5(B)(3).

## 506.4 General

**(A) Documentation for Industrial Occupancies.** Areas designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment.

**(B) Reference Standards.** Important information relating to topics covered in Chapter 5 are found in other publications.

Informational Note: It is important that the authority having jurisdiction be familiar with the recorded industrial experience as well as with standards of the National Fire Protection Association (NFPA), the International Society of Automation (ISA), and the International Electrotechnical Commission (IEC) that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

## 506.5 Classification of Locations

**(A) Classifications of Locations.** Locations shall be classified on the basis of the properties of the combustible dust or ignitable fibers/flyings that may be present, and the likelihood that a combustible or combustible concentration or quantity is present. Each room, section, or area shall be considered individually in determining its classification. Where pyrophoric materials are the only materials used or handled, these locations are outside of the scope of this article.

**(B) Zone 20, Zone 21, and Zone 22 Locations.** Zone 20, Zone 21, and Zone 22 locations are those in which combustible dust or ignitable fibers/flyings are or may be present in the air or in layers, in quantities sufficient to produce explosive or ignitable mixtures. Zone 20, Zone 21, and Zone 22 locations shall include those specified in 506.5(B)(1), (B)(2), and (B)(3).

Informational Note: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in a reduced level of classification and, thus, to reduce the amount of special equipment required.

**(1) Zone 20.** A Zone 20 location is a location in which

- (a) Ignitable concentrations of combustible dust or ignitable fibers/flyings are present continuously.
- (b) Ignitable concentrations of combustible dust or ignitable fibers/flyings are present for long periods of time.

Informational Note No. 1: As a guide to classification of Zone 20 locations, refer to [ANSI/ISA-61241-10 \(12.10.05\)-2004](#), *Electrical Apparatus for Use in Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations — Classification of Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations*.

Informational Note No. 2: Zone 20 classification includes locations inside dust containment systems; hoppers, silos, etc., cyclones and filters, dust transport systems, except some parts of belt and chain conveyors, etc.; blenders, mills, dryers, bagging equipment, etc.

**(2) Zone 21.** A Zone 21 location is a location

- (a) In which ignitable concentrations of combustible dust or ignitable fibers/flyings are likely to exist occasionally under normal operating conditions; or
- (b) In which ignitable concentrations of combustible dust or ignitable fibers/flyings may exist frequently because of repair or maintenance operations or because of leakage; or
- (c) In which equipment is operated or processes are carried on, of such a nature that equipment breakdown or faulty operations could result in the release of ignitable concentrations of combustible dust or ignitable fibers/flyings

and also cause simultaneous failure of electrical equipment in a mode to cause the electrical equipment to become a source of ignition; or

(d) That is adjacent to a Zone 20 location from which ignitable concentrations of dust or ignitable fibers/flyings could be communicated, unless communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

Informational Note No. 1: As a guide to classification of Zone 21 locations, refer to **ANSI/ISA-61241-10 (12.10.05)-2004, Electrical Apparatus for Use in Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations — Classification of Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations.**

Informational Note No. 2: This classification usually includes locations outside dust containment and in the immediate vicinity of access doors subject to frequent removal or opening for operation purposes when internal combustible mixtures are present; locations outside dust containment in the proximity of filling and emptying points, feed belts, sampling points, truck dump stations, belt dump over points, etc. where no measures are employed to prevent the formation of combustible mixtures; locations outside dust containment where dust accumulates and where due to process operations the dust layer is likely to be disturbed and form combustible mixtures; locations inside dust containment where explosive dust clouds are likely to occur (but neither continuously, nor for long periods, nor frequently) as, for example, silos (if filled and/or emptied only occasionally) and the dirty side of filters if large self-cleaning intervals are occurring.

### (3) Zone 22. A Zone 22 location is a location

(a) In which ignitable concentrations of combustible dust or ignitable fibers/flyings are not likely to occur in normal operation and, if they do occur, will only persist for a short period; or

(b) In which combustible dust or fibers/flyings are handled, processed, or used but in which the dust or fibers/flyings are normally confined within closed containers of closed systems from which they can escape only as a result of the abnormal operation of the equipment with which the dust or fibers/flyings are handled, processed, or used; or

(c) That is adjacent to a Zone 21 location, from which ignitable concentrations of dust or fibers/flyings could be communicated, unless such communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

Informational Note No. 1: As a guide to classification of Zone 22 locations, refer to **ANSI/ISA-61241-10 (12.10.05)-2004, Electrical Apparatus for Use in Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations — Classification of Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations.**

*Informational Note No. 2: Zone 22 locations usually include outlets from bag filter vents, because in the event of a malfunction there can be emission of combustible mixtures; locations near equipment that has to be opened at infrequent intervals or equipment that from experience can easily form leaks where, due to pressure above atmospheric, dust will blow out; pneumatic equipment, flexible connections that can become damaged, etc.; storage locations for bags containing dusty product, since failure of bags can occur during handling, causing dust leakage; and locations where controllable dust layers are formed that are likely to be raised into explosive dust-air mixtures. Only if the layer is removed by cleaning before hazardous dust-air mixtures can be formed is the area designated unclassified.*

Informational Note No. 3: Locations that normally are classified as Zone 21 can fall into Zone 22 when measures are employed to prevent the formation of explosive dust-air mixtures. Such measures include exhaust ventilation. The measures should be used in the vicinity of (bag) filling and emptying points, feed belts, sampling points, truck dump stations, belt dump over points, etc.

## 506.6 Special Precaution

Article 506 requires equipment construction and installation that ensures safe performance under conditions of proper use and maintenance.

Informational Note: It is important that inspection authorities and users exercise more than ordinary care with regard to the installation and maintenance of electrical equipment in hazardous (classified) locations.

### (A) Implementation of Zone Classification System.

Classification of areas, engineering and design, selection of equipment and wiring methods, installation, and inspection shall be performed by qualified persons.

**(B) Dual Classification.** In instances of areas within the same facility classified separately, Zone 22 locations shall be permitted to abut, but not overlap, Class II or Class III, Division 2 locations. Zone 20 or Zone 21 locations shall not abut Class II or Class III, Division 1 or Division 2 locations.

**(C) Reclassification Permitted.** A Class II or Class III, Division 1 or Division 2 location shall be permitted to be reclassified as a Zone 20, Zone 21, or Zone 22 location, provided that all of the space that is classified because of a single combustible dust or ignitable fiber/flying source is reclassified under the requirements of this article.

**(D) Simultaneous Presence of Flammable Gases and Combustible Dusts or Fibers/Flyings.** Where flammable gases, combustible dusts, or fibers/flyings are or may be present at the same time, the simultaneous presence shall be considered during the selection and installation of the electrical equipment and the wiring methods, including the de-

termination of the safe operating temperature of the electrical equipment.

### 506.8 Protection Techniques

Acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations shall be as described in 506.8(A) through (J).

**(A) Dust Ignitionproof.** This protection technique shall be permitted for equipment in Zone 20, Zone 21, and Zone 22 locations for which it is identified.

**(B) Pressurized.** This protection technique shall be permitted for equipment in Zone 21 and Zone 22 locations for which it is identified.

**(C) Intrinsic Safety.** This protection technique shall be permitted for equipment in Zone 20, Zone 21, and Zone 22 locations for which it is identified. Installation of intrinsically safe apparatus and wiring shall be in accordance with the requirements of Article 504.

**(D) Dusttight.** This protection technique shall be permitted for equipment in Zone 22 locations for which it is identified.

**(E) Protection by Encapsulation “mD”.** This protection technique shall be permitted for equipment in Zone 20, Zone 21, and Zone 22 locations for which it is identified.

Informational Note: See Table 506.9(C)(2)(3) for the descriptions of subdivisions for encapsulation.

**(F) Nonincendive Circuit.** This protection technique shall be permitted for equipment in Zone 22 locations for which it is identified.

**(G) Nonincendive Equipment.** This protection technique shall be permitted for equipment in Zone 22 locations for which it is identified.

**(H) Protection by Enclosure “tD”.** This protection technique shall be permitted for equipment in Zone 21 and Zone 22 locations for which it is identified.

**(I) Protection by Pressurization “pD”.** This protection technique shall be permitted for equipment in Zone 21 and Zone 22 locations for which it is identified.

**(J) Protection by Intrinsic Safety “iD”.** This protection technique shall be permitted for equipment in Zone 20, Zone 21, and Zone 22 locations for which it is listed.

### 506.9 Equipment Requirements

**(A) Suitability.** Suitability of identified equipment shall be determined by one of the following:

- (1) Equipment listing or labeling
- (2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
- (3) Evidence acceptable to the authority having jurisdiction such as a manufacturer’s self-evaluation or an owner’s engineering judgment

Informational Note: Additional documentation for equipment may include certificates demonstrating compliance with applicable equipment standards, indicating special conditions of use, and other pertinent information.

#### (B) Listing.

- (1) Equipment that is listed for Zone 20 shall be permitted in a Zone 21 or Zone 22 location of the same dust or ignitable fiber/flying. Equipment that is listed for Zone 21 may be used in a Zone 22 location of the same dust fiber/flying.
- (2) Equipment shall be permitted to be listed for a specific dust or ignitable fiber/flying or any specific combination of dusts fibers/flyings.

#### (C) Marking.

**(1) Division Equipment.** Equipment identified for Class II, Division 1 or Class II, Division 2 shall, in addition to being marked in accordance with 500.8(C), be permitted to be marked with both of the following:

- (1) Zone 20, 21, or 22 (as applicable)
- (2) Temperature classification in accordance with 506.9(D)

**(2) Zone Equipment.** Equipment meeting one or more of the protection techniques described in 506.8 shall be marked with the following in the order shown:

- (1) Zone
- (2) Symbol “AEx”
- (3) Protection technique(s) in accordance with Table 506.9(C)(2)(3)
- (4) Temperature classification, marked as a temperature value, in degrees C, preceded by T
- (5) Ambient temperature marking in accordance with 506.9(D)

Informational Note: The EPL (or equipment protection level) may appear in the product marking. EPLs are designated as G for gas, D for dust, or M for mining, and are then followed by a letter (a, b, or c) to give the user a better understanding as to whether the equipment provides either (a) a “very high,” (b) “high,” or (c) an “enhanced” level of protection against ignition of an explosive atmosphere. For example, an AEx pb IIIB T165°C motor (which is suitable by protection concept for application in Zone 21) may additionally be marked with an EPL of “Db”, AEx p IIIB T165°C Db.

**TABLE 506.9(C)(2)(3) Types of Protection Designation**

Designation	Technique	Zone*
iaD	Protection by intrinsic safety	20
ia	Protection by intrinsic safety	20
ibD	Protection by intrinsic safety	21
ib	Protection by intrinsic safety	21
[iaD]	Associated apparatus	Unclassified**
[ia]	Associated apparatus	Unclassified**
[ibD]	Associated apparatus	Unclassified**
[ib]	Associated apparatus	Unclassified**
maD	Protection by encapsulation	20
ma	Protection by encapsulation	20
mbD	Protection by encapsulation	21
mb	Protection by encapsulation	21
pD	Protection by pressurization	21
p	Protection by pressurization	21
pb	Protection by pressurization	21
tD	Protection by enclosures	21
ta	Protection by enclosures	21
tb	Protection by enclosures	21
tc	Protection by enclosures	22

\*Does not address use where a combination of techniques is used.

\*\*Associated apparatus is permitted to be installed in a hazardous (classified) location if suitably protected using another type of protection.

Informational Note: The “D” suffix on the type of protection designation was employed prior to the introduction of Group IIIA, IIIB, and IIIC; which is now used to distinguish between the type of protection employed for Group II (Gases) or Group III (Dusts).

**(D) Temperature Classifications.** Equipment shall be marked to show the operating temperature referenced to a 40°C (104°F) ambient. Electrical equipment designed for use in the ambient temperature range between –20°C and +40°C shall require no additional ambient temperature marking. Electrical equipment that is designed for use in a range of ambient temperatures other than –20°C and +40°C is considered to be special; and the ambient temperature range shall then be marked on the equipment, including either the symbol “Ta” or “Tamb” together with the special range of ambient temperatures. As an example, such a marking might be “–30°C ≤ Ta ≤ +40°C.” Electrical equipment suitable for ambient temperatures exceeding 40°C (104°F) shall be marked with both the maximum ambient temperature and the operating temperature at that ambient temperature.

*Exception No. 1: Equipment of the non-heat-producing type, such as conduit fittings, shall not be required to have a marked operating temperature.*

*Exception No. 2: Equipment identified for Class II, Division 1 or Class II, Division 2 locations as permitted by*

*506.20(B) and (C) shall be permitted to be marked in accordance with 500.8(C) and Table 500.8(C).*

**(E) Threading.** The supply connection entry thread form shall be NPT or metric. Conduit and fittings shall be made wrenchtight to prevent sparking when the fault current flows through the conduit system and to ensure the integrity of the conduit system. Equipment provided with threaded entries for field wiring connections shall be installed in accordance with 506.9(E)(1) or (E)(2) and with (E)(3).

**(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings.** For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit fittings, or cable fittings shall be used. All NPT threaded conduit and fittings referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) thread.

Informational Note: Thread specifications for NPT threads are located in ANSI/ASME B1.20.1-1983, *Pipe Threads, General Purpose (Inch)*.

**(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings.** For equipment with metric threaded entries, listed conduit fittings or listed cable fittings shall be used. Such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT threaded fittings shall be provided with the equipment and shall be used for connection to conduit or NPT threaded fittings. Metric threaded entries shall be made up with at least five threads fully engaged.

**(3) Unused Openings.** All unused openings shall be closed with listed metal close-up plugs. The plug engagement shall comply with 506.9(E)(1) or (E)(2).

**(F) Optical Fiber Cables.** Where an optical fiber cable contains conductors that are capable of carrying current (composite optical fiber cable), the optical fiber cable shall be installed in accordance with the requirements of Articles 506.15 and 506.16.

The requirements for fiber optic cables with conductors capable of carrying current are required to follow the general wiring and sealing methods for Zone 20, 21, or 22 locations.

## 506.15 Wiring Methods

Wiring methods shall maintain the integrity of the protection techniques and shall comply with 506.15(A), (B), or (C).

**(A) Zone 20.** In Zone 20 locations, the following wiring methods shall be permitted.

- (1) Threaded rigid metal conduit or threaded steel intermediate metal conduit.
- (2) Type MI cable terminated with fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

*Exception: MI cable and fittings listed for Class II, Division 1 locations shall be permitted to be used.*

- (3) In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable listed for use in Zone 20 locations, with a continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the application, shall be permitted. Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.

*Exception: Type MC-HL cable and fittings listed for Class II, Division 1 locations shall be permitted to be used.*

- (4) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type ITC-HL cable listed for use in Zone 1 or Class I, Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material, and terminated with fittings listed for the application. Type ITC-HL cable shall be installed in accordance with the provisions of Article 727.
- (5) Fittings and boxes shall be identified for use in Zone 20 locations.

*Exception: Boxes and fittings listed for Class II, Division 1 locations shall be permitted to be used.*

- (6) Where necessary to employ flexible connections, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord listed for extra-hard usage and provided with listed fittings shall be used. Where flexible cords are used, they shall also comply with 506.17 and shall be terminated with a listed cord connector that maintains the type of protection of the terminal compartment. Where flexible connections are subject to oil or other corrosive conditions, the insulation of the conductors shall be of a type listed for the condition or shall be protected by means of a suitable sheath.

*Exception: Flexible conduit and flexible conduit and cord fittings listed for Class II, Division 1 locations shall be permitted to be used.*

Informational Note: See 506.25 for grounding requirements where flexible conduit is used.

**(B) Zone 21.** In Zone 21 locations, the wiring methods in (B)(1) and (B)(2) shall be permitted.

- (1) All wiring methods permitted in 506.15(A).
- (2) Fittings and boxes that are dusttight, provided with threaded bosses for connection to conduit, in which taps, joints, or terminal connections are not made, and are not used in locations where metal dust is present, may be used.

**(C) Zone 22.** In Zone 22 locations, the following wiring methods shall be permitted.

- (1) All wiring methods permitted in 506.15(B).
- (2) Rigid metal conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways.
- (3) Type MC or MI cable with listed termination fittings.
- (4) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, including installation in cable tray systems. The cable shall be terminated with listed fittings.
- (5) Type ITC and Type ITC-ER cable as permitted in 727.4 and terminated with listed fittings.
- (6) Type MC, MI, MV, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between two adjacent cables, shall be the wiring method employed. Single-conductor Type MV cables shall be shielded or metallic armored.
- (7) Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit, provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.

Informational Note: *Simple apparatus* is defined in 504.2.

Separation of nonincendive field wiring circuits shall be in accordance with one of the following:

- a. Be in separate cables
  - b. Be in multiconductor cables where the conductors of each circuit are within a grounded metal shield
  - c. Be in multiconductor cables where the conductors have insulation with a minimum thickness of 0.25 mm (0.01 in.)
- (8) Boxes and fittings shall be dusttight.

### 506.16 Sealing

Where necessary to protect the ingress of combustible dust or ignitable fibers/flyings, or to maintain the type of protection, seals shall be provided. The seal shall be identified as capable of preventing the ingress of combustible dust or ignitable fibers/flyings and maintaining the type of protection but need not be explosionproof or flameproof.

### 506.17 Flexible Cords

Flexible cords used in Zone 20, Zone 21, and Zone 22 locations shall comply with all of the following:

- (1) Be of a type listed for extra-hard usage
- (2) Contain, in addition to the conductors of the circuit, an equipment grounding conductor complying with 400.23
- (3) Be connected to terminals or to supply conductors in an approved manner
- (4) Be supported by clamps or by other suitable means in such a manner to minimize tension on the terminal connections
- (5) Be terminated with a listed cord connector that maintains the protection technique of the terminal compartment

### 506.20 Equipment Installation

**(A) Zone 20.** In Zone 20 locations, only equipment listed and marked as suitable for the location shall be permitted.

*Exception:* Equipment listed for use in Class II, Division 1 locations with a suitable temperature class shall be permitted.

**(B) Zone 21.** In Zone 21 locations, only equipment listed and marked as suitable for the location shall be permitted.

*Exception No. 1:* Apparatus listed for use in Class II, Division 1 locations with a suitable temperature class shall be permitted.

*Exception No. 2:* Pressurized equipment identified for Class II, Division 1 shall be permitted.

**(C) Zone 22.** In Zone 22 locations, only equipment listed and marked as suitable for the location shall be permitted.

*Exception No. 1:* Apparatus listed for use in Class II, Division 1 or Class II, Division 2 locations with a suitable temperature class shall be permitted.

*Exception No. 2:* Pressurized equipment identified for Class II, Division 1 or Division 2 shall be permitted.

**(D) Manufacturer's Instructions.** Electrical equipment installed in hazardous (classified) locations shall be installed

in accordance with the instructions (if any) provided by the manufacturer.

**(E) Temperature.** The temperature marking specified in 506.9(C)(2)(5) shall comply with (E)(1) or (E)(2):

- (1) For combustible dusts, less than the lower of either the layer or cloud ignition temperature of the specific combustible dust. For organic dusts that may dehydrate or carbonize, the temperature marking shall not exceed the lower of either the ignition temperature or 165°C (329°F).
- (2) For ignitable fibers/flyings, less than 165°C (329°F) for equipment that is not subject to overloading, or 120°C (248°F) for equipment (such as motors or power transformers) that may be overloaded.

*Informational Note:* See NFPA 499-2008, *Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Processing Areas*, for minimum ignition temperatures of specific dusts.

### 506.21 Multiwire Branch Circuits

In Zone 20 and Zone 21 locations, a multiwire branch circuit shall not be permitted.

*Exception:* Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.

### 506.25 Grounding and Bonding

Grounding and bonding shall comply with Article 250 and the requirements in 506.25(A) and (B).

**(A) Bonding.** The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, and so forth, between Zone 20, Zone 21, and Zone 22 locations and the point of grounding for service equipment or point of grounding of a separately derived system.

*Exception:* The specific bonding means shall be required only to the nearest point where the grounded circuit conductor and the grounding electrode conductor are connected together on the line side of the building or structure disconnecting means as specified in 250.32(B) if the branch side overcurrent protection is located on the load side of the disconnecting means.

*Informational Note:* See 250.100 for additional bonding requirements in hazardous (classified) locations.

**(B) Types of Equipment Grounding Conductors.** Liquidtight flexible metal conduit shall include an equipment bonding jumper of the wire type in compliance with 250.102.

*Exception: In Zone 22 locations, the bonding jumper shall be permitted to be deleted where all of the following conditions are met:*

- (1) Listed liquidtight flexible metal conduit 1.8 m (6 ft) or less in length, with fittings listed for grounding, is used.
- (2) Overcurrent protection in the circuit is limited to 10 amperes or less.
- (3) The load is not a power utilization load.

## ARTICLE 510 Hazardous (Classified) Locations — Specific

### Contents

- 510.1 Scope
- 510.2 General

### 510.1 Scope

Articles 511 through 517 cover occupancies or parts of occupancies that are or may be hazardous because of atmospheric concentrations of flammable liquids, gases, or vapors, or because of deposits or accumulations of materials that may be readily ignitable.

Some of the requirements contained in Articles 511 through 517 have been extracted from other NFPA codes and standards. For example, Tables 514.3(B)(1), 514.3(B)(2), and 515.3 are extracted from NFPA 30A, *Code for Motor Fuel Dispensing Facilities and Repair Garages*, and NFPA 30, *Flammable and Combustible Liquids Code*. The tables were developed by the NFPA Technical Committees responsible for those documents. The documents were developed through the same process as the *NEC*; however, the National Electrical Code Committee is not directly responsible for the technical content of extracted material.

NFPA publishes a number of standards and recommended practices that provide requirements or guidance on the classification of hazardous locations in specific occupancies. Information and copies of standards may be obtained from NFPA, 1 Batterymarch Park, Quincy, MA 02169-7471.

### 510.2 General

The general rules of this *Code* and the provisions of Articles 500 through 504 shall apply to electrical wiring and equipment in occupancies within the scope of Articles 511 through 517, except as such rules are modified in Articles 511 through 517. Where unusual conditions exist in a specific occupancy, the authority having jurisdiction shall judge with respect to the application of specific rules.

  - (B) Supplying Circuits with Grounded and Grounding Conductors in Class I Locations

**Informational Note:** Text that is followed by a reference in brackets has been extracted from NFPA 30A-2008, *Code for Motor Fuel Dispensing Facilities and Repair Garages*. Only editorial changes were made to the extracted text to make it consistent with this *Code*.

### 511.1 Scope

These occupancies shall include locations used for service and repair operations in connection with self-propelled

vehicles (including, but not limited to, passenger automobiles, buses, trucks, and tractors) in which volatile flammable liquids or flammable gases are used for fuel or power.

Article 100 defines *garage* as “a building or portion of a building in which one or more self-propelled vehicles can be kept for use, sale, storage, rental, repair, exhibition, or demonstration purposes.” Article 511 applies to commercial garages in which the primary operation is the service and repair of self-propelled vehicles that use flammable gases or liquids for fuel. These commercial garages include automotive service centers; repair garages for commercial vehicles, such as trucks and tractors; and service garages for fleet vehicles, such as buses, cars, and trucks.

The requirements of Article 511 are intended to mitigate the potential for an ignition-capable arc or spark from electrical wiring or equipment used in or above hazardous locations. Also covered are requirements for personnel protection in occupancies that are frequently wet or damp in which service personnel are subject to contact with large grounded surfaces, such as concrete slabs in direct contact with the earth. The increasing number of service operations in which minor repairs, such as oil changes, occur is covered under the requirements of this article plus the belowgrade work area classification requirements of Article 514. See 511.3 and its associated commentary.

Parking, storage, and similar occupancies are not required to be classified, provided that any repair that occurs is minor and does not involve the use of electrical equipment. In accordance with NFPA 88A, *Standard for Parking Structures*, a mechanical ventilating system that is capable of continuously providing a ventilation rate of 1 ft<sup>3</sup> per minute for each square foot of floor area is required for all enclosed, basement, and underground parking garages.

Operations that involve open flames or electric arcs, including fusion gas welding and electric welding, as well as the requirements for heat-producing appliances, are found in NFPA 30A, *Code for Motor Fuel Dispensing Facilities and Repair Garages*. Repair work that involves an open flame or electric arcs must be restricted to areas specifically provided for such purposes.

Section 555.22 requires that the repair facilities for boats and other marine craft comply with the requirements of Article 511.

## 511.2 Definitions

Two definitions extracted from NFPA 30A, *Code for Motor Fuel Dispensing Facilities and Repair Garages*, provide a clear definition of a major and minor repair garage.

**Major Repair Garage.** A building or portions of a building where major repairs, such as engine overhauls, painting, body and fender work, and repairs that require draining of the motor vehicle fuel tank are performed on motor vehicles, including associated floor space used for offices, parking, or showrooms. [30A:3.3.12.1]

**Minor Repair Garage.** A building or portions of a building used for lubrication, inspection, and minor automotive maintenance work, such as engine tune-ups, replacement of parts, fluid changes (e.g., oil, antifreeze, transmission fluid, brake fluid, air-conditioning refrigerants), brake system repairs, tire rotation, and similar routine maintenance work, including associated floor space used for offices, parking, or showrooms. [30A:3.3.12.2]

## 511.3 Area Classification, General

Where Class I liquids or gaseous fuels are stored, handled, or transferred, electrical wiring and electrical utilization equipment shall be designed in accordance with the requirements for Class I, Division 1 or 2 hazardous (classified) locations as classified in accordance with 500.5 and 500.6, and this article. A Class I location shall not extend beyond an unpierced wall, roof, or other solid partition that has no openings. [30A:8.3.5, 8.3.2]

The classification of areas in a garage is dependent upon the level of repair (major or minor) being conducted and the handling of flammable liquids or gaseous fuels, other than for dispensing purposes. Rather than classifying a location by a specific function being performed, general areas such as floor, ceiling, or pit areas are classified based on the level of repair being conducted. As stated in 511.3(B), the classification of dispensing areas of a repair garage is addressed in Article 514.

The term *transferred* is used in determining the requirements for classifying locations where a significant quantity of flammable or gaseous liquids are exposed to the atmosphere by a motor vehicle repair operation (e.g., major engine overhauls or repairs that require draining of the motor vehicle fuel tank). Minor repair garages, by definition under NFPA 30A, *Code for Motor Fuel Dispensing Facilities and Repair Garages*, would not be permitted to conduct such types of repair operations involving the transfer of flammable or gaseous liquids.

The term *Class I liquids* refers to *flammable liquids* as defined in NFPA 30, *Flammable and Combustible Liquids Code*, and extracted below. Gasoline is a common Class I liquid, whereas diesel fuel, because of its flash point being above 100°F, is classified as a Class II combustible liquid. The use of Class I, Class II, and Class III in NFPA 30 for the classification of liquids has no direct correlation to the use

of Class I, Class II, and Class III in the *NEC* to designate hazardous locations.

**Flammable Liquid.** Any liquid that has a closed-cup flash point below 100°F (37.8°C), as determined by the test procedures and apparatus set forth in Section 4.4 and a Reid vapor pressure that does not exceed an absolute pressure of 40 psi (276 kPa) at 100°F (37.8°C), as determined by ASTM D 323, *Standard Test Method for Vapor Pressure of Petroleum Products (Reid Method)*. Flammable liquids are classified according to Section 4.3 [NFPA 30-2008: 3.3.30.2]. Flammable liquids are further subclassified as follows:

1. Class IA liquid — Any liquid that has a flash point below 73°F (22.8°C) and a boiling point below 100°F (37.8°C)
2. Class IB liquid — Any liquid that has a flash point below 73°F (22.8°C) and a boiling point at or above 100°F (37.8°C)
3. Class IC liquid — Any liquid that has a flash point at or above 73°F (22.8°C), but below 100°F (37.8°C). [NFPA 30-2008: 4.3.1]

The need to establish hazardous locations can be mitigated through the use of mechanical ventilation that meets the specified air exchange parameters. The *Code* indicates different classification areas dependent on whether ventilation is or is not provided. Where it is established that there will be hazardous locations within a commercial garage, all applicable requirements of Article 501 for installing wiring and equipment in Class I, Division 1 and 2 locations must be followed.

**(A) Parking Garages.** Parking garages used for parking or storage shall be permitted to be unclassified.

Informational Note: For further information, see NFPA 88A-2011, *Standard for Parking Structures*, and NFPA 30A-2008, *Code for Motor Fuel Dispensing Facilities and Repair Garages*.

**(B) Repair Garages, With Dispensing.** Major and minor repair garages that dispense motor fuels into the fuel tanks of vehicles, including flammable liquids having a flash point below 38°C (100°F) such as gasoline, or gaseous fuels such as natural gas, hydrogen, or LPG, shall have the dispensing functions and components classified in accordance with Table 514.3(B)(1) in addition to any classification required by this section. Where Class I liquids, other than fuels, are dispensed, the area within 900 mm (3 ft) of any fill or dispensing point, extending in all directions, shall be a Class I, Division 2 location.

**(C) Major Repair Garages.** Where flammable liquids having a flash point below 38°C (100°F) such as gasoline, or

gaseous fuels such as natural gas, hydrogen, or LPG, will not be dispensed, but repair activities that involve the transfer of such fluids or gases are performed, the classification rules in (1), (2), and (3) shall apply.

#### (1) Floor Areas.

(a) *Ventilation Provided.* The floor area shall be unclassified where there is mechanical ventilation providing a minimum of four air changes per hour or  $0.3 \text{ m}^3/\text{min}/\text{m}^2$  ( $1 \text{ cfm}/\text{ft}^2$ ) of exchanged air for each square meter (foot) of floor area. Ventilation shall provide for air exchange across the entire floor area, and exhaust air shall be taken at a point within 0.3 m (12 in.) of the floor.

(b) *Ventilation Not Provided.* The entire floor area up to a level of 450 mm (18 in.) above the floor shall be classified as Class I, Division 2 if the ventilation does not comply with 511.3(C)(1)(a).

**(2) Ceiling Areas.** Where lighter-than-air gaseous fueled vehicles, such as vehicles fueled by natural gas or hydrogen, are repaired or stored, the area within 450 mm (18 in.) of the ceiling shall be considered for classification in accordance with (a) and (b).

(a) *Ventilation Provided.* The ceiling area shall be unclassified where ventilation is provided, from a point not more than 450 mm (18 in.) from the highest point in the ceiling, to exhaust the ceiling area at a rate of not less than  $0.3 \text{ m}^3/\text{min}/\text{m}^2$  ( $1 \text{ cfm}/\text{ft}^2$ ) of ceiling area at all times that the building is occupied or when vehicles using lighter-than-air gaseous fuels are parked below this area.

(b) *Ventilation Not Provided.* Ceiling areas that are not ventilated in accordance with 511.3(C)(2)(a) shall be classified as Class I, Division 2.

**(3) Pit Areas in Lubrication or Service Room.** Any pit, belowgrade work area, or subfloor work area shall be classified as provided in (a) or (b).

Sections 511.3(C)(1) through (3) define the conditions for classifying a major repair garage. In accordance with 511.3(C), the Class I, Division 2 location above grade within a commercial garage in which Class I liquids or gaseous fuels are transferred extends 18 in. above floor level, unless mechanical ventilation provides at least four air changes per hour. The same 18 in. applies down from ceiling areas when lighter-than-air-fuel vehicles are maintained unless ventilation similar to the floor area of the ceiling area is provided. Areas suitably cut off and areas adjacent to unclassified, ventilated garages are not classified as hazardous.

The Class I, Division 1 location below grade extends from the floor of the pit or depression to floor level, unless the pit or depression is classified as Class I, Division 2, because of ventilation providing at least six air changes per hour exhausts air at the floor level of the pit or depression. See Exhibit 511.1 for an illustration of classified and unclassified locations in a major repair garage.

(a) *Ventilation Provided.* The pit area shall be a Class I, Division 2 location where there is mechanical ventilation providing a minimum of six air changes per hour.

(b) *Ventilation Not Provided.* Where ventilation is not provided in accordance with 511.3(C)(3)(a), any pit or depression below floor level shall be a Class I, Division 1 location that extends up to the floor level.

**(D) Minor Repair Garages.** Where flammable liquids having a flash point below 38°C (100°F) such as gasoline, or gaseous fuels such as natural gas or hydrogen, will not be dispensed or transferred, the classification rules in (D)(1), (D)(2), and (D)(3) shall apply to the lubrication and service rooms.

The condition specified in 511.3(D) is used to classify facilities that primarily offer oil and filter change and lubrication-type services, not the transfer of fuel. If the lower-level work area of a lubritorium is provided with exhaust ventilation at a rate specified, the lower level is not a hazardous location.

**(1) Floor Areas.** Floor areas in minor repair garages without pits, belowgrade work areas, or subfloor work areas shall be unclassified. Where floor areas include pits, belowgrade work areas, or subfloor work areas in lubrication or service rooms, the classification rules in (a) or (b) shall apply.

(a) *Ventilation Provided.* The entire floor area shall be unclassified where there is mechanical ventilation providing a minimum of four air changes per hour or  $0.3 \text{ m}^3/\text{min}/\text{m}^2$  ( $1 \text{ cfm}/\text{ft}^2$ ) of exchanged air for each square meter (foot) of floor area. Ventilation shall provide for air exchange across the entire floor area, and exhaust air shall be taken at a point within 0.3 m (12 in.) of the floor.

(b) *Ventilation Not Provided.* The floor area up to a level of 450 mm (18 in.) above any unventilated pit, belowgrade work area, or subfloor work area and extending a distance of 900 mm (3 ft) horizontally from the edge of any such pit, belowgrade work area, or subfloor work area, shall be classified as Class I, Division 2.

**(2) Ceiling Areas.** Where lighter-than-air gaseous fuels (such as natural gas or hydrogen) will not be transferred, such locations shall be unclassified.

**(3) Pit Areas in Lubrication or Service Room.** Any pit, belowgrade work area, or subfloor work area shall be classified as provided in (a) or (b).

(a) *Ventilation Provided.* Where ventilation is provided to exhaust the pit area at a rate of not less than  $0.3 \text{ m}^3/\text{min}/\text{m}^2$  ( $1 \text{ cfm}/\text{ft}^2$ ) of floor area at all times that the building is occupied, or when vehicles are parked in or over this area and where exhaust air is taken from a point within 300 mm (12 in.) of the floor of the pit, belowgrade work area, or subfloor work area, the pit shall be unclassified. [30A:7.4.5.4. Table 8.3.1]

(b) *Ventilation Not Provided.* Where ventilation is not provided in accordance with 511.3(D)(3)(a), any pit or depression below floor level shall be a Class I, Division 2 location that extends up to the floor level.

#### **(E) Modifications to Classification.**

**(1) Specific Areas Adjacent to Classified Locations.** Areas adjacent to classified locations in which flammable vapors are not likely to be released, such as stock rooms, switchboard rooms, and other similar locations, shall be unclassified where mechanically ventilated at a rate of four or more air changes per hour, or designed with positive air pressure, or where effectively cut off by walls or partitions.

**(2) Alcohol-Based Windshield Washer Fluid.** The area used for storage, handling, or dispensing into motor vehicles of alcohol-based windshield washer fluid in repair garages shall be unclassified unless otherwise classified by a provision of 511.3. [30A:8.3.5, Exception]

### **511.4 Wiring and Equipment in Class I Locations**

**(A) Wiring Located in Class I Locations.** Within Class I locations as classified in 511.3, wiring shall conform to applicable provisions of Article 501.

**(B) Equipment Located in Class I Locations.** Within Class I locations as defined in 511.3, equipment shall conform to applicable provisions of Article 501.

**(1) Fuel-Dispensing Units.** Where fuel-dispensing units (other than liquid petroleum gas, which is prohibited) are located within buildings, the requirements of Article 514 shall govern.

Where mechanical ventilation is provided in the dispensing area, the control shall be interlocked so that the

**EXHIBIT 511.1** Classification of locations in commercial garages.

dispenser cannot operate without ventilation, as prescribed in 500.5(B)(2).

Figure 514.3 in the *Code* and Exhibit 514.1 provide more information on classified areas in the vicinity of dispensing units.

**(2) Portable Lighting Equipment.** Portable lighting equipment shall be equipped with handle, lampholder, hook, and substantial guard attached to the lampholder or handle. All exterior surfaces that might come in contact with battery terminals, wiring terminals, or other objects shall be of non-conducting material or shall be effectively protected with insulation. Lampholders shall be of an unswitched type and shall not provide means for plug-in of attachment plugs. The outer shell shall be of molded composition or other suitable material. Unless the lamp and its cord are supported or arranged in such a manner that they cannot be used in the locations classified in 511.3, they shall be of a type identified for Class I, Division 1 locations.

Portable luminaires are often used for supplemental lighting during vehicle servicing. Unless specifically identified for use in a Class I, Division 1 location, reel-type portable hand luminaires are permitted provided the cord and lamp is arranged such that they cannot be used in hazardous locations within the garage.

## 511.7 Wiring and Equipment Installed Above Class I Locations

For the installation of electrical wiring in areas above those designated by 511.3 as Class I locations, 511.7 specifies the types of raceway and cable systems that are allowed. The integrity of the wiring system above the area is necessary to ensure that an ignition-capable arc or spark does not migrate into the hazardous location. Wiring installed above unclassified areas can be selected from the methods covered in Chapter 3, provided the article covering that wiring method does not contain any restrictions that would limit its use in commercial garages.

### (A) Wiring in Spaces Above Class I Locations.

**(1) Fixed Wiring Above Class I Locations.** All fixed wiring above Class I locations shall be in metal raceways, rigid nonmetallic conduit, electrical nonmetallic tubing, flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit, or shall be Type MC, AC, MI, manufactured wiring systems, or PLTC cable in accordance with Article 725, or Type TC cable or Type ITC cable

in accordance with Article 727. Cellular metal floor raceways or cellular concrete floor raceways shall be permitted to be used only for supplying ceiling outlets or extensions to the area below the floor, but such raceways shall have no connections leading into or through any Class I location above the floor.

**(2) Pendant.** For pendants, flexible cord suitable for the type of service and listed for hard usage shall be used.

### (B) Electrical Equipment Installed Above Class I Locations.

**(1) Fixed Electrical Equipment.** Electrical equipment in a fixed position shall be located above the level of any defined Class I location or shall be identified for the location.

(a) *Arcing Equipment.* Equipment that is less than 3.7 m (12 ft) above the floor level and that may produce arcs, sparks, or particles of hot metal, such as cutouts, switches, charging panels, generators, motors, or other equipment (excluding receptacles, lamps, and lampholders) having make-and-break or sliding contacts, shall be of the totally enclosed type or constructed so as to prevent the escape of sparks or hot metal particles.

(b) *Fixed Lighting.* Lamps and lampholders for fixed lighting that is located over lanes through which vehicles are commonly driven or that may otherwise be exposed to physical damage shall be located not less than 3.7 m (12 ft) above floor level, unless of the totally enclosed type or constructed so as to prevent escape of sparks or hot metal particles.

## 511.9 Sealing

Seals complying with the requirements of 501.15 and 501.15(B)(2) shall be provided and shall apply to horizontal as well as vertical boundaries of the defined Class I locations.

Seals are required if any part of the raceway is in or passes through a Class I location. Note that the general rules of 501.15(A)(4) and (B)(2) on providing seals at hazardous location boundaries do apply where raceway installations in a commercial garage pass from classified to unclassified locations and where conduit fittings, outlet boxes, or both are installed less than 12 in. from either side of the boundary. In accordance with 501.15(A)(4), Exception No. 2, where a raceway runs from a Class I, Division 1 location into an underground unclassified location and then emerges from below ground into an unclassified location, the boundary seal is permitted to be located more than 10 ft from the actual boundary, provided the seal is located at the point the conduit emerges from below grade into the unclassified

location. The seal and, if necessary, an associated explosion-proof union are required to be the first fitting(s) at the point the conduit emerges from below ground into the unclassified location.

Exhibit 511.2 depicts two receptacle outlet enclosures that are located at least 12 in. above an area that has been classified as Class I. The rigid metal conduit passes unbroken from the outlet boxes through the Class I location into the unclassified underground location beneath the floor. The conduit coupling is located 12 in. or more from the penetration into the hazardous location. No seals are required for this installation in accordance with 501.15(A)(4), Exception No. 1.

**EXHIBIT 511.2** Seals not required for conduits that pass unbroken through the Class I location.

### 511.10 Special Equipment

**(A) Battery Charging Equipment.** Battery chargers and their control equipment, and batteries being charged, shall not be located within locations classified in 511.3.

#### **(B) Electric Vehicle Charging Equipment.**

**(1) General.** All electrical equipment and wiring shall be installed in accordance with Article 625, except as noted in 511.10(B)(2) and (B)(3). Flexible cords shall be of a type identified for extra-hard usage.

**(2) Connector Location.** No connector shall be located within a Class I location as defined in 511.3.

**(3) Plug Connections to Vehicles.** Where the cord is suspended from overhead, it shall be arranged so that the low-

est point of sag is at least 150 mm (6 in.) above the floor. Where an automatic arrangement is provided to pull both cord and plug beyond the range of physical damage, no additional connector shall be required in the cable or at the outlet.

### 511.12 Ground-Fault Circuit-Interrupter Protection for Personnel

All 125-volt, single-phase, 15- and 20-ampere receptacles installed in areas where electrical diagnostic equipment, electrical hand tools, or portable lighting equipment are to be used shall have ground-fault circuit-interrupter protection for personnel.

The required ground-fault circuit interrupter (GFCI) may be either a receptacle type or a circuit-breaker type. This requirement applies to receptacles supplying specific types of utilization equipment that will be in use by repair personnel in environments where the floor surface (typically, concrete slabs with direct or indirect earth contact) and the possibility of dampness or even standing water increase the potential for electric shock.

See the definition of *ground-fault circuit interrupter* in Article 100.

### 511.16 Grounding and Bonding Requirements

**(A) General Grounding Requirements.** All metal raceways, the metal armor or metallic sheath on cables, and all non-current-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded.

**(B) Supplying Circuits with Grounded and Grounding Conductors in Class I Locations.** Grounding in Class I locations shall comply with 501.30.

**(1) Circuits Supplying Portable Equipment or Pendants.** Where a circuit supplies portables or pendants and includes a grounded conductor as provided in Article 200, receptacles, attachment plugs, connectors, and similar devices shall be of the grounding type, and the grounded conductor of the flexible cord shall be connected to the screw shell of any lampholder or to the grounded terminal of any utilization equipment supplied.

**(2) Approved Means.** Approved means shall be provided for maintaining continuity of the equipment grounding conductor between the fixed wiring system and the non-current-carrying metal portions of pendant luminaires, portable luminaires, and portable utilization equipment.

#### 513.1 Scope

This article shall apply to buildings or structures in any part of which aircraft containing Class I (flammable) liquids or Class II (combustible) liquids whose temperatures are above their flash points are housed or stored and in which aircraft might undergo service, repairs, or alterations. It shall not apply to locations used exclusively for aircraft that have never contained fuel or unfueled aircraft.

The scope of Article 513 clarifies that it is not required to classify areas in which the only fuel contained in the aircraft is a Class II combustible liquid, unless the fuel will be used or stored above its flash point. A Class II liquid has a closed-cup flash point at or above 100°F. Some aviation fuel, such as that used in jet engines, is a Class II combustible liquid. See the definition of *combustible liquid* in NFPA 30, *Flammable and Combustible Liquids Code*. An aircraft manufacturing plant in which the aircraft under construction have never contained fuel is an example of a facility not covered by the requirements of Article 513.

For further information, see NFPA 409, *Standard on Aircraft Hangars*.

Informational Note No. 1: For definitions of aircraft hangar and unfueled aircraft, see NFPA 409-2011, *Standard on Aircraft Hangars*.

Informational Note No. 2: For further information on fuel classification see NFPA 30-2008, *Flammable and Combustible Liquids Code*.

#### 513.2 Definitions

For the purpose of this article, the following definitions shall apply.

**Aircraft Painting Hangar.** An aircraft hangar constructed for the express purpose of spray/coating/dipping applications and provided with dedicated ventilation supply and exhaust.

**Mobile Equipment.** Equipment with electrical components suitable to be moved only with mechanical aids or is provided with wheels for movement by person(s) or powered devices.

**Portable Equipment.** Equipment with electrical components suitable to be moved by a single person without mechanical aids.

#### 513.3 Classification of Locations

**(A) Below Floor Level.** Any pit or depression below the level of the hangar floor shall be classified as a Class I, Division 1 or Zone 1 location that shall extend up to said floor level.

**(B) Areas Not Cut Off or Ventilated.** The entire area of the hangar, including any adjacent and communicating areas not suitably cut off from the hangar, shall be classified as a Class I, Division 2 or Zone 2 location up to a level 450 mm (18 in.) above the floor.

**(C) Vicinity of Aircraft.**

**(1) Aircraft Maintenance and Storage Hangars.** The area within 1.5 m (5 ft) horizontally from aircraft power plants or aircraft fuel tanks shall be classified as a Class I,

Division 2 or Zone 2 location that shall extend upward from the floor to a level 1.5 m (5 ft) above the upper surface of wings and of engine enclosures.

To properly classify hangar areas, information on the aircraft parking patterns, the types of aircraft, and the operations to be performed in the hangar must be obtained. Much of the hangar area classification is dependent on the dimensional outline of the aircraft; therefore, consideration of future aircraft and parking patterns is appropriate to avoid costs associated with changes in the area classification. Exhibit 513.1 illustrates the area classifications in aircraft hangars. In addition to illustrating the requirements of 513.3(A), (B) and (C) (1), the provision in 513.7(C) to afford protection from arcing equipment is also depicted.

**(2) Aircraft Painting Hangars.** The area within 3 m (10 ft) horizontally from aircraft surfaces from the floor to 3 m (10 ft) above the aircraft shall be classified as Class I, Division 1 or Class I, Zone 1. The area horizontally from aircraft surfaces between 3.0 m (10 ft) and 9.0 m (30 ft) from the floor to 9.0 m (30 ft) above the aircraft surface shall be classified as Class I, Division 2 or Class I, Zone 2.

Informational Note: See NFPA 33-2011, *Standard for Spray Application Using Flammable or Combustible Materials*, for information on ventilation and grounding for static protection in spray painting areas.

**(D) Areas Suitably Cut Off and Ventilated.** Adjacent areas in which flammable liquids or vapors are not likely to be released, such as stock rooms, electrical control rooms, and other similar locations, shall be unclassified where adequately ventilated and where effectively cut off from the hangar itself by walls or partitions.

### 513.4 Wiring and Equipment in Class I Locations

**(A) General.** All wiring and equipment that is or may be installed or operated within any of the Class I locations de-

**EXHIBIT 513.1** Area classification in aircraft hangars.

finished in 513.3 shall comply with the applicable provisions of Article 501 or Article 505 for the division or zone in which they are used.

Attachment plugs and receptacles in Class I locations shall be identified for Class I locations or shall be designed such that they cannot be energized while the connections are being made or broken.

**(B) Stanchions, Rostrums, and Docks.** Electrical wiring, outlets, and equipment (including lamps) on or attached to stanchions, rostrums, or docks that are located or likely to be located in a Class I location, as defined in 513.3(C), shall comply with the applicable provisions of Article 501 or Article 505 for the division or zone in which they are used.

### 513.7 Wiring and Equipment Not Installed in Class I Locations

**(A) Fixed Wiring.** All fixed wiring in a hangar but not installed in a Class I location as classified in 513.3 shall be installed in metal raceways or shall be Type MI, TC, or MC cable.

*Exception: Wiring in unclassified locations, as described in 513.3(D), shall be permitted to be any suitable type wiring method recognized in Chapter 3.*

**(B) Pendants.** For pendants, flexible cord suitable for the type of service and identified for hard usage or extra-hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.

**(C) Arcing Equipment.** In locations above those described in 513.3, equipment that is less than 3.0 m (10 ft) above wings and engine enclosures of aircraft and that may produce arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, receptacles, charging panels, generators, motors, or other equipment having make-and-break or sliding contacts, shall be of the totally enclosed type or constructed so as to prevent the escape of sparks or hot metal particles.

*Exception: Equipment in areas described in 513.3(D) shall be permitted to be of the general-purpose type.*

**(D) Lampholders.** Lampholders of metal-shell, fiber-lined types shall not be used for fixed incandescent lighting.

**(E) Stanchions, Rostrums, or Docks.** Where stanchions, rostrums, or docks are not located or likely to be located in a Class I location, as defined in 513.3(C), wiring and equipment shall comply with 513.7, except that such wiring and equipment not more than 457 mm (18 in.) above the floor in any position shall comply with 513.4(B). Receptacles and

attachment plugs shall be of a locking type that will not readily disconnect.

**(F) Mobile Stanchions.** Mobile stanchions with electrical equipment complying with 513.7(E) shall carry at least one permanently affixed warning sign with the following words or equivalent:

WARNING  
KEEP 5 FT CLEAR OF AIRCRAFT  
ENGINES AND FUEL TANK AREAS

or

WARNING  
KEEP 1.5 METERS CLEAR OF AIRCRAFT  
ENGINES AND FUEL TANK AREAS

### 513.8 Underground Wiring

**(A) Wiring and Equipment Embedded, Under Slab, or Underground.** All wiring installed in or under the hangar floor shall comply with the requirements for Class I, Division 1 locations. Where such wiring is located in vaults, pits, or ducts, adequate drainage shall be provided.

**(B) Uninterrupted Raceways, Embedded, Under Slab, or Underground.** Uninterrupted raceways that are embedded in a hangar floor or buried beneath the hangar floor shall be considered to be within the Class I location above the floor, regardless of the point at which the raceway descends below or rises above the floor.

Wiring and equipment embedded in or buried below the hangar floor is considered to be in a Class I, Division 1 location whereas uninterrupted raceways that are embedded in or buried below the hangar floor are considered to be in the same hazardous location that exists above the floor. Raceways that rise out of the floor in unclassified locations must be provided with boundary seals in accordance with 501.15.

### 513.9 Sealing

Seals shall be provided in accordance with 501.15 or 505.16, as applicable. Sealing requirements specified shall apply to horizontal as well as to vertical boundaries of the defined Class I locations.

### 513.10 Special Equipment

#### (A) Aircraft Electrical Systems.

**(1) De-energizing Aircraft Electrical Systems.** Aircraft electrical systems shall be de-energized when the aircraft is stored in a hangar and, whenever possible, while the aircraft is undergoing maintenance.

**(2) Aircraft Batteries.** Aircraft batteries shall not be charged where installed in an aircraft located inside or partially inside a hangar.

**(B) Aircraft Battery Charging and Equipment.** Battery chargers and their control equipment shall not be located or operated within any of the Class I locations defined in 513.3 and shall preferably be located in a separate building or in an area such as defined in 513.3(D). Mobile chargers shall carry at least one permanently affixed warning sign with the following words or equivalent:

WARNING  
KEEP 5 FT CLEAR OF AIRCRAFT ENGINES  
AND FUEL TANK AREAS

or

WARNING  
KEEP 1.5 METERS CLEAR OF AIRCRAFT  
ENGINES AND FUEL TANK AREAS

Tables, racks, trays, and wiring shall not be located within a Class I location and, in addition, shall comply with Article 480.

**(C) External Power Sources for Energizing Aircraft.**

**(1) Not Less Than 450 mm (18 in.) Above Floor.** Aircraft energizers shall be designed and mounted such that all electrical equipment and fixed wiring will be at least 450 mm (18 in.) above floor level and shall not be operated in a Class I location as defined in 513.3(C).

**(2) Marking for Mobile Units.** Mobile energizers shall carry at least one permanently affixed warning sign with the following words or equivalent:

WARNING  
KEEP 5 FT CLEAR OF AIRCRAFT  
ENGINES AND FUEL TANK AREAS

or

WARNING  
KEEP 1.5 METERS CLEAR OF AIRCRAFT  
ENGINES AND FUEL TANK AREAS

**(3) Cords.** Flexible cords for aircraft energizers and ground support equipment shall be identified for the type of service and extra-hard usage and shall include an equipment grounding conductor.

**(D) Mobile Servicing Equipment with Electrical Components.**

**(1) General.** Mobile servicing equipment (such as vacuum cleaners, air compressors, air movers) having electrical wir-

ing and equipment not suitable for Class I, Division 2 or Zone 2 locations shall be so designed and mounted that all such fixed wiring and equipment will be at least 450 mm (18 in.) above the floor. Such mobile equipment shall not be operated within the Class I location defined in 513.3(C) and shall carry at least one permanently affixed warning sign with the following words or equivalent:

WARNING  
KEEP 5 FT CLEAR OF AIRCRAFT ENGINES  
AND FUEL TANK AREAS

or

WARNING  
KEEP 1.5 METERS CLEAR OF AIRCRAFT ENGINES  
AND FUEL TANK AREAS

**(2) Cords and Connectors.** Flexible cords for mobile equipment shall be suitable for the type of service and identified for extra-hard usage and shall include an equipment grounding conductor. Attachment plugs and receptacles shall be identified for the location in which they are installed and shall provide for connection of the equipment grounding conductor.

**(3) Restricted Use.** Equipment that is not identified as suitable for Class I, Division 2 locations shall not be operated in locations where maintenance operations likely to release flammable liquids or vapors are in progress.

**(E) Portable Equipment.**

**(1) Portable Lighting Equipment.** Portable lighting equipment that is used within a hangar shall be identified for the location in which they are used. For portable luminaires, flexible cord suitable for the type of service and identified for extra-hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.

**(2) Portable Utilization Equipment.** Portable utilization equipment that is or may be used within a hangar shall be of a type suitable for use in Class I, Division 2 or Zone 2 locations. For portable utilization equipment, flexible cord suitable for the type of service and approved for extra-hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.

**513.12 Ground-Fault Circuit-Interrupter Protection for Personnel**

All 125-volt, 50/60-Hz, single-phase, 15- and 20-ampere receptacles installed in areas where electrical diagnostic equipment, electrical hand tools, or portable lighting equipment are to be used shall have ground-fault circuit-interrupter protection for personnel.

All 125-volt, 50/60-Hz, single-phase, 15- to 20-ampere receptacles are required to be provided with ground-fault protection for personnel in locations where electrical tools and diagnostic equipment are used. GFCI protection is not required on circuits supplied at 400 Hz and higher.

### 513.16 Grounding and Bonding Requirements

**(A) General Grounding Requirements.** All metal raceways, the metal armor or metallic sheath on cables, and all non-current-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded. Grounding in Class I locations shall comply with 501.30 for Class I, Division 1 and 2 locations and 505.25 for Class I, Zone 0, 1, and 2 locations.

#### **(B) Supplying Circuits with Grounded and Grounding Conductors in Class I Locations.**

**(1) Circuits Supplying Portable Equipment or Pendants.** Where a circuit supplies portables or pendants and includes a grounded conductor as provided in Article 200, receptacles, attachment plugs, connectors, and similar devices shall be of the grounding type, and the grounded conductor of the flexible cord shall be connected to the screw shell of any lampholder or to the grounded terminal of any utilization equipment supplied.

**(2) Approved Means.** Approved means shall be provided for maintaining continuity of the grounding conductor between the fixed wiring system and the non-current-carrying metal portions of pendant luminaires, portable luminaires, and portable utilization equipment.

- (C) Unattended Self-Service Motor Fuel Dispensing Facilities

514.13 Provisions for Maintenance and Service of Dispensing Equipment

514.16 Grounding and Bonding

Informational Note: Text that is followed by a reference in brackets has been extracted from NFPA 30A-2008, *Code for Motor Fuel Dispensing Facilities and Repair Garages*. Only editorial changes were made to the extracted text to make it consistent with this *Code*.

### 514.1 Scope

This article shall apply to motor fuel dispensing facilities, marine/motor fuel dispensing facilities, motor fuel dispensing facilities located inside buildings, and fleet vehicle motor fuel dispensing facilities.

Article 514 encompasses all locations where volatile flammable liquids or gases are dispensed into the fuel tanks of self-propelled vehicles or other approved fuel tanks. It also includes dispensing at marine facilities such as marinas and boatyards. The phrase *approved containers* in the 514.2 definition covers portable gasoline containers and also applies to dispensing locations for liquefied petroleum gas (LPG), including those locations that do not serve self-propelled vehicles. The popularity of outdoor cooking appliances using LPG has resulted in a marked increase in portable-container dispensing sites. Electrical area classification for LPG sites is specified in Table 514.3(B)(2).

Informational Note: For further information regarding safeguards for motor fuel dispensing facilities, see NFPA 30A-2008, *Code for Motor Fuel Dispensing Facilities and Repair Garages*.

### 514.2 Definition

**Motor Fuel Dispensing Facility.** That portion of a property where motor fuels are stored and dispensed from fixed equipment into the fuel tanks of motor vehicles or marine craft or into approved containers, including all equipment used in connection therewith. [30A:3.3.11]

Informational Note: Refer to Articles 510 and 511 with respect to electrical wiring and equipment for other areas used as lubrication rooms, service rooms, repair rooms, offices, salesrooms, compressor rooms, and similar locations.

### 514.3 Classification of Locations

**(A) Unclassified Locations.** Where the authority having jurisdiction can satisfactorily determine that flammable liq-

uids having a flash point below 38°C (100°F), such as gasoline, will not be handled, such location shall not be required to be classified.

### (B) Classified Locations.

**(1) Class I Locations.** Table 514.3(B)(1) shall be applied where Class I liquids are stored, handled, or dispensed and shall be used to delineate and classify motor fuel dispensing facilities and commercial garages as defined in Article 511. Table 515.3 shall be used for the purpose of delineating and classifying aboveground tanks. A Class I location shall not extend beyond an unpierced wall, roof, or other solid partition. [30A:8.1, 8.3]

**(2) Compressed Natural Gas, Liquefied Natural Gas, and Liquefied Petroleum Gas Areas.** Table 514.3(B)(2) shall be used to delineate and classify areas where compressed natural gas (CNG), liquefied natural gas (LNG), or liquefied petroleum gas (LPG) is stored, handled, or dispensed. Where CNG or LNG dispensers are installed beneath a canopy or enclosure, either the canopy or the enclosure shall be designed to prevent accumulation or entrapment of ignitable vapors, or all electrical equipment installed beneath the canopy or enclosure shall be suitable for Class I, Division 2 hazardous (classified) locations. Dispensing devices for liquefied petroleum gas shall be located not less than 1.5 m (5 ft) from any dispensing device for Class I liquids. [30A:12.1, 12.4, 12.5]

Informational Note No. 1: For information on area classification where liquefied petroleum gases are dispensed, see NFPA 58-2011, *Liquefied Petroleum Gas Code*.

Informational Note No. 2: For information on classified areas pertaining to LP-Gas systems other than residential or commercial, see NFPA 58-2011, *Liquefied Petroleum Gas Code*, and NFPA 59-2008, *Utility LP-Gas Plant Code*.

Informational Note No. 3: See 555.21 for motor fuel dispensing stations in marinas and boatyards.

Tables 514.3(B)(1) and (B)(2) are extracted from NFPA 30A, *Code for Motor Fuel Dispensing Facilities and Repair Garages*. See the commentary following 511.3(D) for information regarding the classification of facilities that offer primarily lubrication-type services. Also see Exhibit 514.1 for an illustration of the Class I location around overhead motor fuel-dispensing units.

Aboveground tanks with dispensing equipment are frequently used at fleet motor fuel-dispensing facilities. Hazardous area classification for aboveground tank installations is also performed in accordance with Table 514.3(B)(1).

## 514.4 Wiring and Equipment Installed in Class I Locations

All electrical equipment and wiring installed in Class I locations as classified in 514.3 shall comply with the applicable provisions of Article 501.

**TABLE 514.3(B)(1) Class I Locations — Motor Fuel Dispensing Facilities**

Location	Division (Group D)	Zone (Group IIA)	Extent of Classified Location <sup>1</sup>
<b>Dispensing Device (except Overhead Type)<sup>2,3</sup></b>			
Under dispenser containment	1	1	Entire space within and under dispenser pit or containment
Dispenser	2	2	Within 450 mm (18 in.) of dispenser enclosure or that portion of dispenser enclosure containing liquid handling components, extending horizontally in all directions and down to grade level
Outdoor	2	2	Up to 450 mm (18 in.) above grade level, extending 6 m (20 ft) horizontally in all directions from dispenser enclosure
Indoor			
- with mechanical ventilation	2	2	Up to 450 mm (18 in.) above floor level, extending 6 m (20 ft) horizontally in all directions from dispenser enclosure
- with gravity ventilation	2	2	Up to 450 mm (18 in.) above floor level, extending 7.5 m (25 ft) horizontally in all directions from dispenser enclosure
<b>Dispensing Device — Overhead Type<sup>4</sup></b>			
	1	1	Space within dispenser enclosure and all electrical equipment integral with dispensing hose or nozzle
	2	2	Within 450 mm (18 in.) of dispenser enclosure, extending horizontally in all directions and down to grade level
	2	2	Up to 450 mm (18 in.) above grade level, extending 6 m (20 ft) horizontally in all directions from a point vertically below edge of dispenser enclosure

(continues)

TABLE 514.3(B)(1) *Continued*

Location	Division (Group D)	Zone (Group IIA)	Extent of Classified Location <sup>1</sup>
<b>Remote Pump —</b>			
Outdoor	1	1	Entire space within any pit or box below grade level, any part of which is within 3 m (10 ft) horizontally from any edge of pump
	2	2	Within 900 mm (3 ft) of any edge of pump, extending horizontally in all directions
	2	2	Up to 450 mm (18 in.) above grade level, extending 3 m (10 ft) horizontally in all directions from any edge of pump
Indoor	1	1	Entire space within any pit
	2	2	Within 1.5 m (5 ft) of any edge of pump, extending in all directions
	2	2	Up to 900 mm (3 ft) above floor level, extending 7.5 m (25 ft) horizontally in all directions from any edge of pump
<b>Sales, Storage, Rest Rooms</b> including structures (such as the attendant's kiosk) on or adjacent to dispensers	unclassified	unclassified	Except as noted below
	1	1	Entire volume, if there is any opening to room within the extent of a Division 1 or Zone 1 location
	2	2	Entire volume, if there is any opening to room within the extent of a Division 2 or Zone 2 location
<b>Tank, Aboveground</b>			
Inside tank	1	0	Entire inside volume
Shell, ends, roof, dike area	1	1	Entire space within dike, where dike height exceeds distance from tank shell to inside of dike wall for more than 50 percent of tank circumference
	2	2	Entire space within dike, where dike height does not exceed distance from tank shell to inside of dike wall for more than 50 percent of tank circumference
Vent	2	2	Within 3 m (10 ft) of shell, ends, or roof of tank
	1	1	Within 1.5 m (5 ft) of open end of vent, extending in all directions
	2	2	Between 1.5 m and 3 m (5 ft and 10 ft) from open end of vent, extending in all directions
<b>Tank, Underground</b>			
Inside tank	1	0	Entire inside volume
Fill Opening	1	1	Entire space within any pit or box below grade level, any part of which is within a Division 1 or Division 2 classified location or within a Zone 1 or Zone 2 classified location
	2	2	Up to 450 mm (18 in.) above grade level, extending 1.5 m (5 ft) horizontally in all directions from any tight-fill connection and extending 3 m (10 ft) horizontally in all directions from any loose-fill connection
Vent	1	1	Within 1.5 m (5 ft) of open end of vent, extending in all directions
	2	2	Between 1.5 m and 3 m (5 ft and 10 ft) from open end of vent, extending in all directions
<b>Vapor Processing System</b>			
Pits	1	1	Entire space within any pit or box below grade level, any part of which: (1) is within a Division 1 or Division 2 classified location; (2) is within a Zone 1 or Zone 2 classified location; (3) houses any equipment used to transfer or process vapors

TABLE 514.3(B)(1) *Continued*

Location	Division (Group D)	Zone (Group IIA)	Extent of Classified Location <sup>1</sup>
Equipment in protective enclosures	2	2	Entire space within enclosure
Equipment <i>not</i> within protective enclosure	2	2	Within 450 mm (18 in.) of equipment containing flammable vapors or liquid, extending horizontally in all directions and down to grade level
	2	2	Up to 450 mm (18 in.) above grade level within 3 m (10 ft) horizontally of the vapor processing equipment
- Equipment enclosure	1	1	Entire space within enclosure, if flammable vapor or liquid is present under normal operating conditions
	2	2	Entire space within enclosure, if flammable vapor or liquid is not present under normal operating conditions
- Vacuum assist blower	2	2	Within 450 mm (18 in.) of blower, extending horizontally in all directions and down to grade level
	2	2	Up to 450 mm (18 in.) above grade level, extending 3 m (10 ft) horizontally in all directions
<b>Vault</b>	1	1	Entire interior space, if Class I liquids are stored within

<sup>1</sup>For marine application, *grade level* means the surface of a pier, extending down to water level.

<sup>2</sup>Refer to Figure 514.3 for an illustration of classified location around dispensing devices.

<sup>3</sup>Area classification inside the dispenser enclosure is covered in UL 87, *Standard for Power-Operated Dispensing Devices for Petroleum Products*.

<sup>4</sup>Ceiling-mounted hose reel. [30A: Table 8.3.1]

TABLE 514.3(B)(2) Electrical Equipment Classified Areas for Dispensing Devices

Dispensing Device	Extent of Classified Area	
	Class I, Division 1	Class I, Division 2
Compressed natural gas	Entire space within the dispenser enclosure	1.5 m (5 ft) in all directions from dispenser enclosure
Liquefied natural gas	Entire space within the dispenser enclosure and 1.5 m (5 ft) in all directions from the dispenser enclosure	From 1.5 m to 3.0 m (5 ft to 10 ft) in all directions from the dispenser enclosure
Liquefied petroleum gas	Entire space within the dispenser enclosure; 450 mm (18 in.) from the exterior surface of the dispenser enclosure to an elevation of 1.2 m (4 ft) above the base of the dispenser; the entire pit or open space beneath the dispenser and within 6.0 m (20 ft) horizontally from any edge of the dispenser when the pit or trench is not mechanically ventilated.	Up to 450 mm (18 in.) aboveground and within 6.0 m (20 ft) horizontally from any edge of the dispenser enclosure, including pits or trenches within this area when provided with adequate mechanical ventilation

[30A: Table 12.6.2]

*Exception: As permitted in 514.8.*

Informational Note: For special requirements for conductor insulation, see 501.20.

dispenser power, lighting, or both connect to the internal wiring of the dispenser in the explosionproof junction box.

The applicable wiring methods and equipment in Article 501 must be used within the Class I areas at a motor fuel-dispensing facility. An explosionproof junction box of the type frequently used in gasoline dispensing units is shown in Exhibit 514.2. The branch-circuit conductors for

## 514.7 Wiring and Equipment Above Class I Locations

Wiring and equipment above the Class I locations as classified in 514.3 shall comply with 511.7.

**FIGURE 514.3** Classified Areas Adjacent to Dispensers as Detailed in Table 514.3(B)(1). [30A:Figure 8.3.1]

**EXHIBIT 514.1** Extent of Class I location around overhead motor fuel-dispensing units, in accordance with Table 514.3(B)(1).

## 514.8 Underground Wiring

Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit. Any portion of electrical wiring that is below the surface of a Class I, Division 1, or a Class I, Division 2, location [as classified in Table 514.3(B)(1) and Table 514.3(B)(2)] shall be sealed within 3.05 m (10 ft) of the point of emergence

**EXHIBIT 514.2** A typical explosionproof junction box used in a dispenser application. (Courtesy of Cooper Crouse-Hinds)

above grade. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point of emergence above grade. Refer to Table 300.5.

Fuel spilled in the vicinity of gasoline dispensers seeps into the ground and may migrate into underground electrical conduits. Therefore, all conduits installed below the hazardous locations of a motor fuel-dispensing facility are required be sealed within 10 ft of the point of emergence from below grade. This boundary seal minimizes the passage of gasoline or other fuel vapors into unclassified locations where the electrical equipment is not explosionproof or otherwise protected. Tables 514.3(B)(1) and (B)(2) define the extent of the aboveground Class I, Divisions 1 and 2 locations.

*Exception No. 1: Type MI cable shall be permitted where it is installed in accordance with Article 332.*

*Exception No. 2: Type PVC conduit and Type RTRC conduit shall be permitted where buried under not less than 600 mm (2 ft) of cover. Where Type PVC conduit or Type RTRC conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (2 ft) of the underground run to emergence*

or to the point of connection to the aboveground raceway, and an equipment grounding conductor shall be included to provide electrical continuity of the raceway system and for grounding of non-current-carrying metal parts.

Exception No. 2 makes clear that, where Type PVC or RTRC conduit is used for underground wiring, threaded rigid metal conduit or threaded steel intermediate metal conduit must be used for the last 2 ft of the underground run to the point of emergence or to the point of connection to the aboveground raceway. These rigid nonmetallic conduits, including any nonmetallic conduit elbows and fittings, must be located not less than 2 ft below grade, as shown in Exhibit 514.3.

**EXHIBIT 514.3** Use of rigid nonmetallic conduit in accordance with 514.8, Exception No. 2.

If rigid nonmetallic conduit (Type PVC or RTRC) is used, an equipment grounding conductor must be included and must be bonded to the explosionproof raceway system inside the dispenser. Installation is accomplished by terminating the equipment grounding conductor on the ground screw (or other means) provided in the dispenser junction box.

### 514.9 Sealing

**(A) At Dispenser.** A listed seal shall be provided in each conduit run entering or leaving a dispenser or any cavities or enclosures in direct communication therewith. The sealing fitting shall be the first fitting after the conduit emerges from the earth or concrete.

**(B) At Boundary.** Additional seals shall be provided in accordance with 501.15. Sections 501.15(A)(4) and (B)(2)

shall apply to horizontal as well as to vertical boundaries of the defined Class I locations.

Sealing fittings are required in all conduits entering and leaving a dispenser and leaving a Class I location. Therefore, even though a conduit runs from dispenser to dispenser and does not leave the hazardous location, a seal is necessary where the conduit leaves, and again where it enters, a dispenser. Conduits passing under the boundaries of the hazardous locations (20-ft radius from dispenser, 10-ft radius from a loose-fill tank connection, and 5-ft radius from a tight-fill tank connection) are considered to be in a Class I location, and the seal is to be the first fitting at the point of emergence.

Panelboards are generally located in a room classified as a nonhazardous location; however, any conduit coming from the dispenser or passing under the hazardous location boundaries would require a seal at the panelboard location to minimize the likelihood of gas migration into the remote location. If the panelboard is located in the lube or repair room, all conduits emerging into the 18-in. hazardous location would require seals. See Exhibits 514.4 and 514.5.

### 514.11 Circuit Disconnects

**(A) General.** Each circuit leading to or through dispensing equipment, including all associated power, communications, data, and video circuits, and equipment for remote pumping systems, shall be provided with a clearly identified and readily accessible switch or other approved means, located remote from the dispensing devices, to disconnect simultaneously from the source of supply, all conductors of the circuits, including the grounded conductor, if any.

Single-pole breakers utilizing handle ties shall not be permitted.

The disconnecting means must be clearly marked and readily accessible. The disconnecting means also must be remote from the dispensing device, so that if an emergency occurs that requires rapid shutdown of the dispensing equipment, the person operating the disconnecting means is not exposed to the hazard.

All conductors of a circuit, including the grounded conductor that may be present within a dispensing device, must be provided with a switch or special-type circuit breaker that simultaneously disconnects all conductors. Handle ties on single-pole circuit breakers are not permitted. The intent is that no energized conductors are in the dispenser vicinity during maintenance or alteration. In the case of accidental reversal of the polarities of conductors at panelboards, the grounded conductor must be able to be switched to the open or "off" position. Grounded conductors may be present in

**EXHIBIT 514.4** A gasoline dispenser installation indicating locations for sealing fittings.

**EXHIBIT 514.5** Required seals at points marked "S." Seals are not required at the sign and two of the lights because conduit runs do not pass through a hazardous location.

old-style pump motors, or they may pass through a dispenser as part of a circuit for the dispensing island lighting.

Also see the commentary following 514.13.

**(B) Attended Self-Service Motor Fuel Dispensing Facilities.** Emergency controls as specified in 514.11(A) shall be installed at a location acceptable to the authority having jurisdiction, but controls shall not be more than 30 m (100 ft) from dispensers. [30A:6.7.1]

**(C) Unattended Self-Service Motor Fuel Dispensing Facilities.** Emergency controls as specified in 514.11(A) shall be installed at a location acceptable to the authority having jurisdiction, but the control shall be more than 6 m (20 ft) but less than 30 m (100 ft) from the dispensers. Additional

emergency controls shall be installed on each group of dispensers or the outdoor equipment used to control the dispensers. Emergency controls shall shut off all power to all dispensing equipment at the station. Controls shall be manually reset only in a manner approved by the authority having jurisdiction. [30A:6.7.2]

Informational Note: For additional information, see 6.7.1 and 6.7.2 of NFPA 30A-2008, *Code for Motor Fuel Dispensing Facilities and Repair Garages*.

Section 514.11 aligns with Section 6.7 of NFPA 30A-2008, *Code for Motor Fuel Dispensing Facilities and Repair Garages*, in requiring an easily accessible and clearly identified emergency power shutoff to be provided at a location remote

**EXHIBIT 514.6** A self-service dispensing island (left) and associated emergency disconnecting means (right).

from the dispensing device. This shutoff is necessary because a fire or large gasoline spill at the dispensing island may make it impossible for a person to approach and shut off the flow of gasoline by operating a disconnecting means located at the dispensing island.

The distance requirements in 514.11(B) and 514.11(C), extracted from NFPA 30A, address both attended and unattended self-service dispensing facilities.

The term *clearly identified* means that a sign must be posted indicating where the shutoff switch is located. This emergency power shutoff must be readily accessible and not blocked by the storage of such things as tires, cases of lubricating oil, or display merchandise. All dispensing facility operators as well as responding fire fighters should know the location of the emergency power shutoff.

Exhibit 514.6 shows a typical dispensing island at a self-service gas station (left) and the required clearly identified emergency disconnect (right). During the evening hours, this location is an unattended self-service dispensing facility. In accordance with 514.11(C) the disconnect must be located where acceptable to the AHJ and is required to be located between 20 ft and 100 ft of the dispensers.

### 514.13 Provisions for Maintenance and Service of Dispensing Equipment

Each dispensing device shall be provided with a means to remove all external voltage sources, including power, com-

munications, data, and video circuits and including feedback, during periods of maintenance and service of the dispensing equipment. The location of this means shall be permitted to be other than inside or adjacent to the dispensing device. The means shall be capable of being locked in the open position.

As more sophisticated control circuitry is integrated into dispensing equipment, simply shutting off the main power source to the dispenser or remote pump does not necessarily ensure that the equipment has been isolated from all sources of voltage. Ensuring that the equipment is completely isolated from all voltage sources by a means to remove all external voltage sources from each dispensing device, including sources that may backfeed into the dispenser, enhances the level of safety for personnel servicing dispensing equipment. Exhibit 514.7 shows the interior of an electronic dispensing unit. Power is required to be removed from printers, displays, keypads, and card readers.

The disconnecting means required by this section must be capable of being locked in the open position. To ensure that the ability to lock the disconnecting means in the open position is always available, the method employed should not be portable or easily removed from the disconnecting means.

### 514.16 Grounding and Bonding

All metal raceways, the metal armor or metallic sheath on cables, and all non-current-carrying metal parts of fixed and

**EXHIBIT 514.7** An example of the complexity of the interior of electronic dispensing units.

portable electrical equipment, regardless of voltage, shall be grounded and bonded. Grounding and bonding in Class I locations shall comply with 501.30.

**Informational Note:** Text that is followed by a reference in brackets has been extracted from NFPA 30-2008, *Flammable and Combustible Liquids Code*. Only editorial changes were made to the extracted text to make it consistent with this *Code*.

### 515.1 Scope

This article covers a property or portion of a property where flammable liquids are received by tank vessel, pipelines, tank car, or tank vehicle and are stored or blended in bulk for the purpose of distributing such liquids by tank vessel, pipeline, tank car, tank vehicle, portable tank, or container.

Article 515 covers facilities that store (in bulk) and distribute flammable liquids as opposed to dispensing liquids into fuel tanks of vehicles. Flammable liquid dispensing locations, including those within the bulk storage facility, are covered under Article 514. Bulk storage tanks may be located inside buildings or outside either above ground or underground. Addressed by this article are the hazardous locations in the vicinity of the storage tank, and the tank vehicle, pier, or wharf from which the liquids are loaded and offloaded. This article also covers the classification of the areas around drum storage containers.

### 515.2 Definition

**Bulk Plant or Terminal.** That portion of a property where liquids are received by tank vessel, pipelines, tank car, or tank vehicle and are stored or blended in bulk for the purpose of distributing such liquids by tank vessel, pipeline, tank car, tank vehicle, portable tank, or container. [30:3.3.32.1]

**Informational Note:** For further information, see NFPA 30-2008, *Flammable and Combustible Liquids Code*.

### 515.3 Class I Locations

Table 515.3 shall be applied where Class I liquids are stored, handled, or dispensed and shall be used to delineate and classify bulk storage plants. The class location shall not extend beyond a floor, wall, roof, or other solid partition that has no communicating openings. [30:8.1, 8.2.2]

Table 515.3 is extracted from Table 7.3.3 of NFPA 30-2008, *Flammable and Combustible Liquids Code*. The first two items in column 1 address the processing equipment used in flammable liquid processing facilities. The area classifications listed in the table are based on the premise that all applicable requirements of NFPA 30 have been met as conveyed by Informational Note 1 to 515.3.

Exhibits 515.1 through 515.7 illustrate the hazardous locations associated with several types of flammable liquid containers and operations. Exhibits 515.1 through 515.5 are from NFPA 497, *Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*.

**TABLE 515.3 Electrical Area Classifications**

Location	NEC Class I Division	Zone	Extent of Classified Area
Indoor equipment installed in accordance with Section 5.3 of NFPA 30 where flammable vapor–air mixtures can exist under normal operation	1	0	The entire area associated with such equipment where flammable gases or vapors are present continuously or for long periods of time
	1	1	Area within 1.5 m (5 ft) of any edge of such equipment, extending in all directions
	2	2	Area between 1.5 m and 2.5 m (5 ft and 8 ft) of any edge of such equipment, extending in all directions; also, space up to 900 mm (3 ft) above floor or grade level within 1.5 m to 7.5 m (5 ft to 25 ft) horizontally from any edge of such equipment <sup>1</sup>
Outdoor equipment of the type covered in Section 5.3 of NFPA 30 where flammable vapor–air mixtures may exist under normal operation	1	0	The entire area associated with such equipment where flammable gases or vapors are present continuously or for long periods of time
	1	1	Area within 900 mm (3 ft) of any edge of such equipment, extending in all directions
	2	2	Area between 900 mm (3 ft) and 2.5 m (8 ft) of any edge of such equipment, extending in all directions; also, space up to 900 mm (3 ft) above floor or grade level within 900 mm to 3.0 m (3 ft to 10 ft) horizontally from any edge of such equipment
Tank storage installations inside buildings	1	1	All equipment located below grade level
	2	2	Any equipment located at or above grade level
Tank – aboveground	1	0	Inside fixed roof tank
	1	1	Area inside dike where dike height is greater than the distance from the tank to the dike for more than 50 percent of the tank circumference
Shell, ends, or roof and dike area	2	2	Within 3.0 m (10 ft) from shell, ends, or roof of tank; also, area inside dike to level of top of dike wall
Vent	1	0	Area inside of vent piping or opening
	1	1	Within 1.5 m (5 ft) of open end of vent, extending in all directions
	2	2	Area between 1.5 m and 3.0 m (5 ft and 10 ft) from open end of vent, extending in all directions
Floating roof with fixed outer roof	1	0	Area between the floating and fixed roof sections and within the shell
Floating roof with no fixed outer roof	1	1	Area above the floating roof and within the shell
Underground tank fill opening	1	1	Any pit, or space below grade level, if any part is within a Division 1 or 2, or Zone 1 or 2, classified location

(continues)

TABLE 515.3 *Continued*

Location	NEC Class I Division	Zone	Extent of Classified Area
Vent – discharging upward	2	2	Up to 450 mm (18 in.) above grade level within a horizontal radius of 3.0 m (10 ft) from a loose fill connection, and within a horizontal radius of 1.5 m (5 ft) from a tight fill connection
	1	0	Area inside of vent piping or opening
	1	1	Within 900 mm (3 ft) of open end of vent, extending in all directions
Drum and container filling – outdoors or indoors	2	2	Area between 900 mm and 1.5 m (3 ft and 5 ft) of open end of vent, extending in all directions
	1	0	Area inside the drum or container
	1	1	Within 900 mm (3 ft) of vent and fill openings, extending in all directions
	2	2	Area between 900 mm and 1.5 m (3 ft and 5 ft) from vent or fill opening, extending in all directions; also, up to 450 mm (18 in.) above floor or grade level within a horizontal radius of 3.0 m (10 ft) from vent or fill opening
Pumps, bleeders, withdrawal fittings			
Indoors	2	2	Within 1.5 m (5 ft) of any edge of such devices, extending in all directions; also, up to 900 mm (3 ft) above floor or grade level within 7.5 m (25 ft) horizontally from any edge of such devices
Outdoors	2	2	Within 900 mm (3 ft) of any edge of such devices, extending in all directions. Also, up to 450 mm (18 in.) above grade level within 3.0 m (10 ft) horizontally from any edge of such devices
Pits and sumps			
Without mechanical ventilation	1	1	Entire area within a pit or sump if any part is within a Division 1 or 2, or Zone 1 or 2, classified location
With adequate mechanical ventilation	2	2	Entire area within a pit or sump if any part is within a Division 1 or 2, or Zone 1 or 2, classified location
Containing valves, fittings, or piping, and not within a Division 1 or 2, or Zone 1 or 2, classified location	2	2	Entire pit or sump
Drainage ditches, separators, impounding basins			
Outdoors	2	2	Area up to 450 mm (18 in.) above ditch, separator, or basin; also, area up to 450 mm (18 in.) above grade within 4.5 m (15 ft) horizontally from any edge
Indoors			Same classified area as pits
Tank vehicle and tank car <sup>2</sup> loading through open dome	1	0	Area inside of the tank
	1	1	Within 900 mm (3 ft) of edge of dome, extending in all directions
	2	2	Area between 900 mm and 4.5 m (3 ft and 15 ft) from edge of dome, extending in all directions
Loading through bottom connections with atmospheric venting	1	0	Area inside of the tank
	1	1	Within 900 mm (3 ft) of point of venting to atmosphere, extending in all directions

TABLE 515.3 *Continued*

Location	NEC Class I Division	Zone	Extent of Classified Area
	2	2	Area between 900 mm and 4.5 m (3 ft and 15 ft) from point of venting to atmosphere, extending in all directions; also, up to 450 mm (18 in.) above grade within a horizontal radius of 3.0 m (10 ft) from point of loading connection
Office and rest rooms	Unclassified		If there is any opening to these rooms within the extent of an indoor classified location, the room shall be classified the same as if the wall, curb, or partition did not exist.
Loading through closed dome with atmospheric venting	1	1	Within 900 mm (3 ft) of open end of vent, extending in all directions
	2	2	Area between 900 mm and 4.5 m (3 ft and 15 ft) from open end of vent, extending in all directions; also, within 900 mm (3 ft) of edge of dome, extending in all directions
Loading through closed dome with vapor control	2	2	Within 900 mm (3 ft) of point of connection of both fill and vapor lines extending in all directions
Bottom loading with vapor control or any bottom unloading	2	2	Within 900 mm (3 ft) of point of connections, extending in all directions; also up to 450 mm (18 in.) above grade within a horizontal radius of 3.0 m (10 ft) from point of connections
Storage and repair garage for tank vehicles	1	1	All pits or spaces below floor level
	2	2	Area up to 450 mm (18 in.) above floor or grade level for entire storage or repair garage
Garages for other than tank vehicles	Unclassified		If there is any opening to these rooms within the extent of an outdoor classified location, the entire room shall be classified the same as the area classification at the point of the opening.
Outdoor drum storage	Unclassified		
Inside rooms or storage lockers used for the storage of Class I liquids	2	2	Entire room
Indoor warehousing where there is no flammable liquid transfer	Unclassified		If there is any opening to these rooms within the extent of an indoor classified location, the room shall be classified the same as if the wall, curb, or partition did not exist.
Piers and wharves			See Figure 515.3.

<sup>1</sup>The release of Class I liquids may generate vapors to the extent that the entire building, and possibly an area surrounding it, should be considered a Class I, Division 2 or Zone 2 location.

<sup>2</sup>When classifying extent of area, consideration shall be given to fact that tank cars or tank vehicles may be spotted at varying points. Therefore, the extremities of the loading or unloading positions shall be used.  
[30: Table 8.2.2]

Informational Note No. 1: The area classifications listed in Table 515.3 are based on the premise that the installation meets the applicable requirements of NFPA 30-2008, *Flammable and Combustible Liquids Code*, Chapter 5, in all respects. Should this not be the case, the authority having jurisdiction has the authority to classify the extent of the classified space.

Informational Note No. 2: See 555.21 for gasoline dispensing stations in marinas and boatyards.

### 515.4 Wiring and Equipment Located in Class I Locations

All electrical wiring and equipment within the Class I locations defined in 515.3 shall comply with the applicable provisions of Article 501 or Article 505 for the division or zone in which they are used.

visions of Article 501 or Article 505 for the division or zone in which they are used.

*Exception: As permitted in 515.8.*

### 515.7 Wiring and Equipment Above Class I Locations

(A) **Fixed Wiring.** All fixed wiring above Class I locations shall be in metal raceways, Schedule 80 PVC conduit, Type RTRC marked with the suffix -XW, or Type MI, Type TC, or Type MC cable, or Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, including installation in cable tray systems or Type ITC and Type

## Notes:

- (1) The "source of vapor" shall be the operating envelope and stored position of the outboard flange connection of the loading arm (or hose).
- (2) The berth area adjacent to tanker and barge cargo tanks is to be Division 2 to the following extent:
  - a. 7.6 m (25 ft) horizontally in all directions on the pier side from that portion of the hull containing cargo tanks
  - b. From the water level to 7.6 m (25 ft) above the cargo tanks at their highest position
- (3) Additional locations may have to be classified as required by the presence of other sources of flammable liquids on the berth, by Coast Guard, or other regulations.

**FIGURE 515.3 Marine Terminal Handling Flammable Liquids. [30:Figure 7.7.16]****EXHIBIT 515.1** Tank car/tank truck loading and unloading via closed system. Transfer through dome only. **EXHIBIT 515.3** Tank car/tank truck loading and unloading via open system. Top or bottom product transfer. [Source: Adapted from NFPA 497-2008, Figure 5.9.4(d)]

**EXHIBIT 515.4** Tank car/tank truck loading and unloading via closed system. Transfer through dome only. [Source: Adapted from NFPA 497-2008, Figure 5.9.4(b)]

**EXHIBIT 515.5** Drum filling station, outdoors or indoors, with adequate ventilation. (Source: Adapted from NFPA 497-2008, Figure 5.9.5)

**EXHIBIT 515.6** Storage tanks for cryogenic liquids. [Source: Adapted from NFPA 59A-2009, Figures 10.7.2(a) through 10.7.2(c)]

**EXHIBIT 515.7** Fixed roof storage tank, outdoors at grade.  
(Source: Adapted from American Petroleum Institute Recommended Practice 500, 2nd ed., November 1997, Figure 6)

ITC-ER cable as permitted in 727.4. The cable shall be terminated with listed fittings.

**(B) Fixed Equipment.** Fixed equipment that may produce arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, receptacles, motors, or other equipment having make-and-break or sliding contacts, shall be of the totally enclosed type or be constructed so as to prevent the escape of sparks or hot metal particles.

**(C) Portable Luminaires or Other Utilization Equipment.** Portable luminaires or other utilization equipment and their flexible cords shall comply with the provisions of Article 501 or Article 505 for the class of location above which they are connected or used.

### 515.8 Underground Wiring

**(A) Wiring Method.** Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit or, where buried under not less than 600 mm (2 ft) of cover, shall be permitted in Type PVC conduit, Type RTRC conduit, or a listed cable. Where Type PVC conduit or Type RTRC conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for not less than the last 600 mm (2 ft) of the conduit run to the conduit point of emergence from the underground location or to the point of connection to an aboveground raceway. Where cable is used, it shall be enclosed in threaded rigid metal conduit or threaded steel intermediate metal conduit from the point of lowest buried cable level to the point of connection to the aboveground raceway.

See the commentary following 514.8 for more information on wiring methods installed under the ground of Class I hazardous locations.

**(B) Insulation.** Conductor insulation shall comply with 501.20.

**(C) Nonmetallic Wiring.** Where Type PVC conduit, Type RTRC conduit, or cable with a nonmetallic sheath is used, an equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non-current-carrying metal parts.

### 515.9 Sealing

Sealing requirements shall apply to horizontal as well as to vertical boundaries of the defined Class I locations. Buried raceways and cables under defined Class I locations shall be considered to be within a Class I, Division 1 or Zone 1 location.

### 515.10 Special Equipment — Gasoline Dispensers

Where gasoline or other volatile flammable liquids or liquefied flammable gases are dispensed at bulk stations, the applicable provisions of Article 514 shall apply.

### 515.16 Grounding and Bonding

All metal raceways, the metal armor or metallic sheath on cables, and all non-current-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded and bonded as provided in Article 250.

Grounding and bonding in Class I locations shall comply with 501.30 for Class I, Division 1 and 2 locations and 505.25 for Class I, Zone 0, 1, and 2 locations.

Informational Note: For information on grounding for static protection, see 4.5.3.4 and 4.5.3.5 of NFPA 30-2008, *Flammable and Combustible Liquids Code*.

Informational Note: Text that is followed by a reference in brackets has been extracted from NFPA 33-2011, *Standard for Spray Application Using Flammable and Combustible Materials*, or NFPA 34-2011, *Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids*. Only editorial changes were made to the extracted text to make it consistent with this *Code*.

### 516.1 Scope

This article covers the regular or frequent application of flammable liquids, combustible liquids, and combustible powders by spray operations and the application of flammable liquids, or combustible liquids at temperatures above their flashpoint, by dipping, coating, or other means.

NFPA 33, *Standard for Spray Application Using Flammable or Combustible Materials*, covers the spray application of flammable or combustible materials by means of compressed air atomization, airless or hydraulic atomization, electrostatic application methods, or any other means in continuous or intermittent processes. NFPA 33 also covers the application of combustible powders applied by powder spray guns, electrostatic powder spray guns, and the fluidized bed application method or electrostatic fluidized bed application method. NFPA 33 also contains requirements for the maintenance of safe conditions as well as personal safety.

NFPA 34, *Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids*, covers the fire and explosion hazards of dipping and coating processes that use flammable or combustible liquids, or use water-borne, water-based, and water-reducible materials that

contain flammable or combustible liquids or that produce combustible deposits or residues.

Informational Note: For further information regarding safeguards for these processes, such as fire protection, posting of warning signs, and maintenance, see NFPA 33-2011, *Standard for Spray Application Using Flammable and Combustible Materials*, and NFPA 34-2011, *Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids*. For additional information regarding ventilation, see NFPA 91-2010, *Standard for Exhaust Systems for Air Conveying of Vapors, Gases, Mists, and Noncombustible Particulate Solids*.

The proper maintenance and operation of processes and process areas where flammable and combustible materials are handled and applied are critical with respect to the protection of life and property from fire or explosion. An analysis of actual experience in industry demonstrates that the largest fire losses and frequency of fires have occurred where the proper codes and standards have not been used or applied properly.

The safety of life and property from fire or explosion as a result of spray applications of flammable and combustible materials, such as paints, finishes, and adhesives, depends on the arrangement and operation of a particular installation. The principal hazards of spray application operations originate from flammable or combustible liquids or powders and their vapors or mists, as well as from highly combustible residues or powders. The human element necessitates careful consideration of the operation's location and the installation of extinguishing equipment to reduce the possibility of fire spreading to other property and to minimize the probability of damage to other property.

### 516.2 Definitions

For the purpose of this article, the following definitions shall apply.

**Spray Area.** Normally, locations outside of buildings or localized operations within a larger room or space. Such are normally provided with some local vapor extraction/ventilation system. In automated operations, the area limits shall be the maximum area in the direct path of spray operations. In manual operations, the area limits shall be the maximum area of spray when aimed at 180 degrees to the application surface.

**Spray Booth.** An enclosure or insert within a larger room used for spray/coating/dipping applications. A spray booth may be fully enclosed or have open front or face and may include separate conveyor entrance and exit. The spray booth is provided with a dedicated ventilation exhaust but

may draw supply air from the larger room or have a dedicated air supply.

**Spray Room.** A purposefully enclosed room built for spray/coating/dipping applications provided with dedicated ventilation supply and exhaust. Normally the room is configured to house the item to be painted, providing reasonable access around the item/process. Depending on the size of the item being painted, such rooms may actually be the entire building or the major portion thereof.

### 516.3 Classification of Locations

Classification is based on dangerous quantities of flammable vapors, combustible mists, residues, dusts, or deposits.

The determination of the extent of hazardous areas involved in spray application requires an understanding of the multiple hazards of flammable vapors, mists, powders, and highly combustible deposits applied at each individual location.

**(A) Class I, Division 1 or Class I, Zone 0 Locations.** The following spaces shall be considered Class I, Division 1, or Class I, Zone 0, as applicable:

- (1) The interior of any open or closed container of a flammable liquid
- (2) The interior of any dip tank or coating tank

Informational Note: For additional guidance and explanatory diagrams, see 4.3.5 of NFPA 33-2011, *Standard for Spray Application Using Flammable or Combustible Materials*, and Sections 4.2, 4.3, and 4.4 of NFPA 34-2011, *Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids*.

**(B) Class I or Class II, Division 1 Locations.** The following spaces shall be considered Class I, Division 1, or Class I, Zone 1, or Class II, Division 1 locations, as applicable:

- (1) The interior of spray booths and rooms except as specifically provided in 516.3(D).
- (2) The interior of exhaust ducts.
- (3) Any area in the direct path of spray operations.
- (4) For open dipping and coating operations, all space within a 1.5-m (5-ft) radial distance from the vapor sources extending from these surfaces to the floor. The vapor source shall be the liquid exposed in the process and the drainboard, and any dipped or coated object from which it is possible to measure vapor concentrations exceeding 25 percent of the lower flammable limit at a distance of 300 mm (1 ft), in any direction, from the object.
- (5) Sumps, pits, or belowgrade channels within 7.5 m (25 ft) horizontally of a vapor source. If the sump, pit,

or channel extends beyond 7.5 m (25 ft) from the vapor source, it shall be provided with a vapor stop or it shall be classified as Class I, Division 1 for its entire length.

- (6) All space in all directions outside of but within 900 mm (3 ft) of open containers, supply containers, spray gun cleaners, and solvent distillation units containing flammable liquids.

**(C) Class I or Class II, Division 2 Locations.** The following spaces shall be considered Class I, Division 2, or Class I, Zone 2, or Class II, Division 2 as applicable.

Where spraying operations are confined to adequately ventilated spray booths or rooms, there should be no deposits of combustible residues or dangerous concentrations of flammable vapors, mists, or dusts outside the spray booth under normal operating conditions. In the interest of safety, however, unless separated by partitions, an area within a certain distance of the Class I (or Class II), Division 1 spraying area, depending on the arrangement, is classified as Division 2; that is, the area should contain no equipment that produces ignition-capable sparks under normal operation. Furthermore, within this distance, electric lamps must be enclosed to prevent hot particles from falling on freshly painted stock or other readily ignitable material and, if subject to physical damage, must be properly guarded. See 516.7(B).

**(1) Open Spraying.** For open spraying, all space outside of but within 6 m (20 ft) horizontally and 3 m (10 ft) vertically of the Class I, Division 1 or Class I, Zone 1 location as defined in 516.3(A), and not separated from it by partitions. See Figure 516.3(C)(1). [33:6.5.1]

**(2) Closed-Top, Open-Face, and Open-Front Spraying.** If spray application operations are conducted within a closed-top, open-face, or open-front booth or room, any electrical wiring or utilization equipment located outside of the booth or room but within the boundaries designated as Division 2 or Zone 2 in Figure 516.3(C)(2) shall be suitable for Class I, Division 2, Class I, Zone 2, or Class II, Division 2 locations, whichever is applicable. The Class I, Division 2, Class I, Zone 2, or Class II, Division 2 locations shown in Figure 516.3(C)(2) shall extend from the edges of the open face or open front of the booth or room in accordance with the following:

- (a) If the exhaust ventilation system is interlocked with the spray application equipment, the Division 2 or Zone 2 location shall extend 1.5 m (5 ft) horizontally and 900 mm (3 ft) vertically from the open face or open front of the booth or room, as shown in Figure 516.3(C)(2), top.

**FIGURE 516.3(C)(1) Electrical Area Classification for Open Spray Areas. [33:Figure 6.5.1]**

(b) If the exhaust ventilation system is not interlocked with the spray application equipment, the Division 2 or Zone 2 location shall extend 3 m (10 ft) horizontally and 900 mm (3 ft) vertically from the open face or open front of the booth or room, as shown in Figure 516.3(C)(2), bottom.

For the purposes of this subsection, *interlocked* shall mean that the spray application equipment cannot be operated unless the exhaust ventilation system is operating and functioning properly and spray application is automatically stopped if the exhaust ventilation system fails. [33:6.5.2.2]

**(3) Open-Top Spraying.** For spraying operations conducted within an open top spray booth, the space 900 mm (3 ft) vertically above the booth and within 900 mm (3 ft) of other booth openings shall be considered Class I, Division 2; Class I, Zone 2; or Class II, Division 2. [33:6.5.3]

**(4) Enclosed Booths and Rooms.** For spraying operations confined to an enclosed spray booth or room, the space within 900 mm (3 ft) in all directions from any openings shall be considered Class I, Division 2; or Class I, Zone 2; or Class II, Division 2 as shown in Figure 516.3(C)(4). [33:6.5.4]

**FIGURE 516.3(C)(2) Class I, Division 2, Class I, Zone 2, or Class II, Division 2 Locations Adjacent to a Closed Top, Open Face, or Open Front Spray Booth or Room. [33:Figures 6.5.2(a) and 6.5.2(b)]**

Properly constructed spray booths, with adequate mechanical ventilation, may be used to discharge vapors or powder to a safe location and reduce the possibility of an explosion. In like manner, the accumulation of overspray residues, many of which are not only highly combustible but also subject to spontaneous ignition, can be controlled.

Exhibit 516.1 shows an enclosed spray room. Note the illumination that meets the requirements of 516.4(C) and lack of other electrical equipment during spray operations in accordance with 516.4(D).

**(5) Dip Tanks and Drain Boards — Surrounding Space.** For dip tanks and drain boards, the 914-mm (3-ft) space surrounding the Class I, Division 1 or Class I, Zone 1 location as defined in 516.3(A)(4) and as shown in Figure 516.3(C) (5). [34:6.4.4]

**FIGURE 516.3(C)(4) Class I, Division 2, Class I, Zone 2, or Class II, Division 2 Locations Adjacent to an Enclosed Spray Booth or Spray Room. [33:Figure 6.5.4]**

**(6) Dip Tanks and Drain Boards — Space Above Floor.**

For dip tanks and drain boards, the space 900 mm (3 ft) above the floor and extending 6 m (20 ft) horizontally in all directions from the Class I, Division 1 or Class I, Zone 1 location.

**EXHIBIT 516.1** An enclosed paint spray room.

*Exception: This space shall not be required to be considered a hazardous (classified) location where the vapor source area is 0.46 m<sup>2</sup> (5 ft<sup>2</sup>) or less and where the contents of the open tank trough or container do not exceed 19 L (5 gal). In addition, the vapor concentration during operation and shutdown periods shall not exceed 25 percent of the lower flammable limit outside the Class I location specified in 516.3(B)(4). [34:6.4.4 Exception]*

**(7) Open Containers.** All space in all directions within 600 mm (2 ft) of the Division 1 or Zone 1 area surrounding open containers, supply containers, spray gun cleaners, and solvent distillation units containing flammable liquids, as

**FIGURE 516.3(C)(5) Electrical Area Classification for Open Processes Without Vapor Containment or Ventilation. [34:Figure 6.4(a)]**

well as the area extending 1.5 m (5 ft) beyond the Division 1 or Zone 1 area up to a height of 460 mm (18 in.) above the floor or grade level. [33:6.6.2]

The parameters of the hazardous location defined around open containers containing flammable liquids are extracted from 6.5.5.1(2) and (3) of NFPA 33-2007, *Standard for Spray Application Using Flammable and Combustible Materials*.

**(D) Enclosed Coating and Dipping Operations.** The space adjacent to an enclosed dipping or coating process or apparatus shall be considered unclassified. [34:6.5.3]

*Exception: The space within 900 mm (3 ft) in all directions from any opening in the enclosures shall be classified as Class I, Division 2 or Class I, Zone 2, as applicable. [34:6.5.2]*

**(E) Adjacent Locations.** Adjacent locations that are cut off from the defined Class I or Class II locations by tight partitions without communicating openings, and within which flammable vapors or combustible powders are not likely to be released, shall be unclassified.

Where spray areas contain dangerous quantities of flammable or combustible vapors, mists, residues, dusts, or deposits under normal operation, the adjacent unpartitioned areas, which are safe under normal operating conditions but which may become dangerous due to accident or careless operation, should be given consideration. Equipment known to produce sparks or flames under normal operating conditions should not be installed in these adjacent unpartitioned areas.

**(F) Unclassified Locations.** Locations using drying, curing, or fusion apparatus and provided with positive mechanical ventilation adequate to prevent accumulation of flammable concentrations of vapors, and provided with effective interlocks to de-energize all electrical equipment (other than equipment identified for Class I locations) in case the ventilating equipment is inoperative, shall be permitted to be unclassified where the authority having jurisdiction so judges.

No open flames or spark-producing equipment should be in any area where, because of inadequate ventilation, explosive vapor–air mixtures or mists are present. Equally important, no open flames or spark-producing equipment should be located where highly combustible spray residues could be deposited on them. Because some residues may be ignited at very low temperatures, additional consideration must be

given to operating temperatures of equipment subject to residue deposits. Many deposits may be ignited at temperatures produced by low-pressure steam pipes or incandescent light globes, even fixtures of the explosionproof type.

Informational Note: For further information regarding safeguards, see NFPA 86-2011, *Standard for Ovens and Furnaces*.

## 516.4 Wiring and Equipment in Class I Locations

**(A) Wiring and Equipment — Vapors.** All electrical wiring and equipment within the Class I location (containing vapor only — not residues) defined in 516.3 shall comply with the applicable provisions of Article 501 or Article 505, as applicable.

Where electrical equipment is installed in locations not subject to deposits of combustible residues but, due to inadequate ventilation, are subject to explosive concentrations of flammable vapors or mists, only approved explosionproof or other types of equipment approved for Class I, Division 1 locations (e.g., purged, pressurized, or intrinsically safe equipment or systems) are permitted.

**(B) Wiring and Equipment — Vapors and Residues.** Unless specifically listed for locations containing deposits of dangerous quantities of flammable or combustible vapors, mists, residues, dusts, or deposits (as applicable), there shall be no electrical equipment in any spray area as herein defined whereon deposits of combustible residue may readily accumulate, except wiring in rigid metal conduit, intermediate metal conduit, Type MI cable, or in metal boxes or fittings containing no taps, splices, or terminal connections. [33:6.4.2]

The elimination of all sources of ignition in those areas where flammable or combustible liquids, vapors, mists, or combustible residues are present, together with constant supervision and maintenance, is essential to the safe operation of spraying.

Electrical equipment is generally not permitted inside any spray booth, in the exhaust duct from a spray booth, in the entrained air of an exhaust system from a spraying operation, or in the direct path of spray, unless such equipment is specifically listed for both readily ignitable deposits and flammable vapor.

The latter part of the requirement in 516.4(B), however, permits wiring in rigid metal conduit, intermediate metal conduit, Type MI cable, or metal boxes or fittings without splices, taps, or terminal connections.

**(C) Illumination.** Illumination of readily ignitable areas through panels of glass or other transparent or translucent material shall be permitted only if it complies with the following:

- (1) Fixed lighting units are used as the source of illumination.
- (2) The panel effectively isolates the Class I location from the area in which the lighting unit is located.
- (3) The lighting unit is identified for its specific location.
- (4) The panel is of a material or is protected so that breakage is unlikely.
- (5) The arrangement is such that normal accumulations of hazardous residue on the surface of the panel will not be raised to a dangerous temperature by radiation or conduction from the source of illumination.

Sufficient lighting for coating operations, booth cleaning, and booth repair work should be provided at the time the equipment is installed, to avoid the use of temporary or emergency luminaires connected to ordinary extension cords in this area. See 516.4(D). A practical method of lighting is the use of wired or tempered glass panels in the top or sides of the spray booth, with electrical luminaires located outside the booth, avoiding the direct path of the spray.

Even where a panel of glass or translucent material separates a lighting unit from the readily ignitable location, the unit is required to be identified for use in the specific location. The *UL Hazardous Locations Equipment Directory* indicates that listed hazardous location luminaires suitable for use in paint spray booths are evaluated for deposits of readily combustible paint residues on the side of the luminaire that forms part of the interior ceiling or wall surface of the spray booth.

**(D) Portable Equipment.** Portable electric luminaires or other utilization equipment shall not be used in a spray area during spray operations.

*Exception No. 1: Where portable electric luminaires are required for operations in spaces not readily illuminated by fixed lighting within the spraying area, they shall be of the type identified for Class I, Division 1 or Class I, Zone 1 locations where readily ignitable residues may be present. [33:6.9 Exception]*

*Exception No. 2: Where portable electric drying apparatus is used in spray booths and the following requirements are met:*

- (a) *The apparatus and its electrical connections are not located within the spray enclosure during spray operations.*

(b) *Electrical equipment within 450 mm (18 in.) of the floor is identified for Class I, Division 2 or Class I, Zone 2 locations.*

(c) *All metallic parts of the drying apparatus are electrically bonded and grounded.*

(d) *Interlocks are provided to prevent the operation of spray equipment while drying apparatus is within the spray enclosure, to allow for a 3-minute purge of the enclosure before energizing the drying apparatus and to shut off drying apparatus on failure of ventilation system.*

**(E) Electrostatic Equipment.** Electrostatic spraying or detearing equipment shall be installed and used only as provided in 516.10.

Informational Note: For further information, see NFPA 33-2011, *Standard for Spray Application Using Flammable or Combustible Materials*.

## 516.7 Wiring and Equipment Not Within Class I and II Locations

**(A) Wiring.** All fixed wiring above the Class I and II locations shall be in metal raceways, Type PVC conduit, Type RTRC conduit, or electrical nonmetallic tubing; where cables are used, they shall be Type MI, Type TC, or Type MC cable. Cellular metal floor raceways shall only be permitted to supply ceiling outlets or as extensions to the area below the floor of a Class I or II location. Where cellular metal raceways are used, they shall not have connections leading into or passing through the Class I or II location unless suitable seals are provided.

**(B) Equipment.** Equipment that may produce arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, receptacles, motors, or other equipment having make-and-break or sliding contacts, where installed above a Class I or II location or above a location where freshly finished goods are handled, shall be of the totally enclosed type or be constructed so as to prevent the escape of sparks or hot metal particles.

Even though areas adjacent to spray booths (particularly where coating-material stocks are located) are assumed to have ventilation sufficient to prevent the presence of flammable vapors or deposits, it is nevertheless advisable that luminaires be totally enclosed to prevent hot particles from falling in any area that may have freshly painted stock, accidentally spilled flammable or combustible materials, readily ignitable refuse, or flammable or combustible liquid containers that have been left open accidentally. Where luminaires are in areas subject to atmospheres of flammable vapor, lamps should be replaced while electricity is off; otherwise, sparking might occur.

### 516.10 Special Equipment

**(A) Fixed Electrostatic Equipment.** This section shall apply to any equipment using electrostatically charged elements for the atomization, charging, and/or precipitation of hazardous materials for coatings on articles or for other similar purposes in which the charging or atomizing device is attached to a mechanical support or manipulator. This shall include robotic devices. This section shall not apply to devices that are held or manipulated by hand. Where robot or programming procedures involve manual manipulation of the robot arm while spraying with the high voltage on, the provisions of 516.10(B) shall apply. The installation of electrostatic spraying equipment shall comply with 516.10(A)(1) through (A)(10). Spray equipment shall be listed. All automatic electrostatic equipment systems shall comply with 516.4(A)(1) through (A)(9).

**(1) Power and Control Equipment.** Transformers, high-voltage supplies, control apparatus, and all other electrical portions of the equipment shall be installed outside of the Class I location as defined in 516.3 or be of a type identified for the location.

*Exception: High-voltage grids, electrodes, electrostatic atomizing heads, and their connections shall be permitted within the Class I location.*

**(2) Electrostatic Equipment.** Electrodes and electrostatic atomizing heads shall be adequately supported in permanent locations and shall be effectively insulated from ground. Electrodes and electrostatic atomizing heads that are permanently attached to their bases, supports, reciprocators, or robots shall be deemed to comply with this section.

**(3) High-Voltage Leads.** High-voltage leads shall be properly insulated and protected from mechanical damage or exposure to destructive chemicals. Any exposed element at high voltage shall be effectively and permanently supported on suitable insulators and shall be effectively guarded against accidental contact or grounding.

**(4) Support of Goods.** Goods being coated using this process shall be supported on conveyors or hangers. The conveyors or hangers shall be arranged (1) to ensure that the parts being coated are electrically connected to ground with a resistance of 1 megohm or less and (2) to prevent parts from swinging.

**(5) Automatic Controls.** Electrostatic apparatus shall be equipped with automatic means that will rapidly de-energize the high-voltage elements under any of the following conditions:

(1) Stoppage of ventilating fans or failure of ventilating equipment from any cause

- (2) Stoppage of the conveyor carrying goods through the high-voltage field unless stoppage is required by the spray process
- (3) Occurrence of excessive current leakage at any point in the high-voltage system
- (4) De-energizing the primary voltage input to the power supply

**(6) Grounding.** All electrically conductive objects in the spray area, except those objects required by the process to be at high voltage, shall be adequately grounded. This requirement shall apply to paint containers, wash cans, guards, hose connectors, brackets, and any other electrically conductive objects or devices in the area.

*Informational Note: For more information on grounding and bonding for static electricity purposes, see NFPA 33-2011, *Standard for Spray Application Using Flammable or Combustible Materials*; NFPA 34-2011, *Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids*; and NFPA 77-2007, *Recommended Practice on Static Electricity*.*

To prevent sparks from the accumulation of static electricity, all electrically conductive objects, including metal parts of spray booths, exhaust ducts, piping systems conveying flammable or combustible liquids or paint, solvent tanks, and canisters, should be properly grounded. See Section 6.7 of NFPA 33-2007 and Section 9.3 of NFPA 77-2007, *Recommended Practice on Static Electricity*.

The same informational note appears in 516.10(B)(4) and (C)(4) to increase awareness of three standards dealing with spray applications, dipping and coating processes, and static electricity for grounding and bonding.

**(7) Isolation.** Safeguards such as adequate booths, fencing, railings, interlocks, or other means shall be placed about the equipment or incorporated therein so that they, either by their location, character, or both, ensure that a safe separation of the process is maintained.

**(8) Signs.** Signs shall be conspicuously posted to convey the following:

- (1) Designate the process zone as dangerous with regard to fire and accident
- (2) Identify the grounding requirements for all electrically conductive objects in the spray area
- (3) Restrict access to qualified personnel only

**(9) Insulators.** All insulators shall be kept clean and dry.

**(10) Other Than Nonincendive Equipment.** Spray equipment that cannot be classified as nonincendive shall comply with (A)(10)(a) and (A)(10)(b).

(a) Conveyors or hangers shall be arranged so as to maintain a safe distance of at least twice the sparking distance between goods being painted and electrodes, electrostatic atomizing heads, or charged conductors. Warnings defining this safe distance shall be posted. [33:11.4.1]

(b) The equipment shall provide an automatic means of rapidly de-energizing the high-voltage elements in the event the distance between the goods being painted and the electrodes or electrostatic atomizing heads falls below that specified in (a). [33:11.3.8]

**(B) Electrostatic Hand-Spraying Equipment.** This section shall apply to any equipment using electrostatically charged elements for the atomization, charging, and/or precipitation of materials for coatings on articles, or for other similar purposes in which the atomizing device is hand-held or manipulated during the spraying operation. Electrostatic hand-spraying equipment and devices used in connection with paint-spraying operations shall be of listed types and shall comply with 516.10(B)(1) through (B)(5).

**(1) General.** The high-voltage circuits shall be designed so as not to produce a spark of sufficient intensity to ignite the most readily ignitable of those vapor-air mixtures likely to be encountered, or result in appreciable shock hazard upon coming in contact with a grounded object under all normal operating conditions. The electrostatically charged exposed elements of the handgun shall be capable of being energized only by an actuator that also controls the coating material supply.

**(2) Power Equipment.** Transformers, power packs, control apparatus, and all other electrical portions of the equipment shall be located outside of the Class I location or be identified for the location.

*Exception: The handgun itself and its connections to the power supply shall be permitted within the Class I location.*

**(3) Handle.** The handle of the spraying gun shall be electrically connected to ground by a metallic connection and be constructed so that the operator in normal operating position is in intimate electrical contact with the grounded handle to prevent buildup of a static charge on the operator's body. Signs indicating the necessity for grounding other persons entering the spray area shall be conspicuously posted.

**(4) Electrostatic Equipment.** All electrically conductive objects in the spraying area shall be adequately grounded. This requirement shall apply to paint containers, wash cans, and any other electrical conductive objects or devices in the area. The equipment shall carry a prominent, permanently installed warning regarding the necessity for this grounding feature.

*Informational Note: For more information on grounding and bonding for static electricity purposes, see NFPA 33-2011, Standard for Spray Application Using Flammable or Combustible Materials; NFPA 34-2011, Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids; and NFPA 77-2007, Recommended Practice on Static Electricity.*

**(5) Support of Objects.** Objects being painted shall be maintained in metallic contact with the conveyor or other grounded support. Hooks shall be regularly cleaned to ensure adequate grounding of 1 megohm or less. Areas of contact shall be sharp points or knife edges where possible. Points of support of the object shall be concealed from random spray where feasible; and, where the objects being sprayed are supported from a conveyor, the point of attachment to the conveyor shall be located so as to not collect spray material during normal operation. [33: Chapter 12]

**(C) Powder Coating.** This section shall apply to processes in which combustible dry powders are applied. The hazards associated with combustible dusts are present in such a process to a degree, depending on the chemical composition of the material, particle size, shape, and distribution.

**(1) Electrical Equipment and Sources of Ignition.** Electrical equipment and other sources of ignition shall comply with the requirements of Article 502. Portable electric luminaires and other utilization equipment shall not be used within a Class II location during operation of the finishing processes. Where such luminaires or utilization equipment are used during cleaning or repairing operations, they shall be of a type identified for Class II, Division 1 locations, and all exposed metal parts shall be connected to an equipment grounding conductor.

*Exception: Where portable electric luminaires are required for operations in spaces not readily illuminated by fixed lighting within the spraying area, they shall be of the type listed for Class II, Division 1 locations where readily ignitable residues may be present.*

**(2) Fixed Electrostatic Spraying Equipment.** The provisions of 516.10(A) and 516.10(C)(1) shall apply to fixed electrostatic spraying equipment.

**(3) Electrostatic Hand-Spraying Equipment.** The provisions of 516.10(B) and 516.10(C)(1) shall apply to electrostatic hand-spraying equipment.

**(4) Electrostatic Fluidized Beds.** Electrostatic fluidized beds and associated equipment shall be of identified types. The high-voltage circuits shall be designed such that any discharge produced when the charging electrodes of the bed are approached or contacted by a grounded object shall not

be of sufficient intensity to ignite any powder–air mixture likely to be encountered or to result in an appreciable shock hazard.

(a) Transformers, power packs, control apparatus, and all other electrical portions of the equipment shall be located outside the powder-coating area or shall otherwise comply with the requirements of 516.10(C)(1).

*Exception: The charging electrodes and their connections to the power supply shall be permitted within the powder-coating area.*

(b) All electrically conductive objects within the powder-coating area shall be adequately grounded. The powder-coating equipment shall carry a prominent, permanently installed warning regarding the necessity for grounding these objects.

**Informational Note:** For more information on grounding and bonding for static electricity purposes, see NFPA 33-2011, *Standard for Spray Application Using Flammable or Combustible Materials*; NFPA 34-2011, *Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids*; and NFPA 77-2007, *Recommended Practice on Static Electricity*.

(c) Objects being coated shall be maintained in electrical contact (less than 1 megohm) with the conveyor or other support in order to ensure proper grounding. Hangers shall be regularly cleaned to ensure effective electrical contact. Areas of electrical contact shall be sharp points or knife edges where possible.

(d) The electrical equipment and compressed air supplies shall be interlocked with a ventilation system so that the equipment cannot be operated unless the ventilating fans are in operation. [33: Chapter 15]

## 516.16 Grounding

All metal raceways, the metal armors or metallic sheath on cables, and all non–current-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded and bonded. Grounding and bonding shall comply with 501.30, 502.30, or 505.25, as applicable.

Informational Note: Text that is followed by a reference in brackets has been extracted from NFPA 99-2005, *Standard for Health Care Facilities*, and NFPA 101-2009, *Life Safety Code*. Only editorial changes were made to the extracted text to make it consistent with this *Code*.

## I. General

### 517.1 Scope

The provisions of this article shall apply to electrical construction and installation criteria in health care facilities that provide services to human beings.

The requirements in Parts II and III not only apply to single-function buildings but are also intended to be individually applied to their respective forms of occupancy within a multifunction building (e.g., a doctor's examining room located within a limited care facility would be required to meet the provisions of 517.10).

Informational Note: For information concerning performance, maintenance, and testing criteria, refer to the appropriate health care facilities documents.

The requirements of Article 517 apply to all types of health care facilities, yet each type of health care facility is intended to apply the article provisions in a very specific manner. For example, in a suite of doctors' offices within an office building, a doctor's business office is treated as an ordinary occupancy and the electrical installation is required to comply with the applicable requirements of Chapters 1 through 4. However, the wiring and electrical equipment in the examining rooms and any other patient care areas within the office suite are required to be installed per the applicable rules of Article 517.

The scope of Article 517 also includes health care facilities that may be mobile or supply very limited outpatient service, but it does not include veterinary offices or animal hospitals.

Other standards referenced in Article 517 include NFPA 99, *Standard for Health Care Facilities*; NFPA 101®, *Life*

*Safety Code*®; and NFPA 20, *Standard for the Installation of Stationary Pumps for Fire Protection*.

### 517.2 Definitions

**Alternate Power Source.** One or more generator sets, or battery systems where permitted, intended to provide power during the interruption of the normal electrical services or the public utility electrical service intended to provide power during interruption of service normally provided by the generating facilities on the premises.

Section 517.30(B)(6) permits alternate power sources to serve essential electrical systems of contiguous or multiple building facilities such as a health care campus with a centrally located alternate power plant.

**Ambulatory Health Care Occupancy.** A building or portion thereof used to provide services or treatment simultaneously to four or more patients that provides, on an outpatient basis, one or more of the following:

- (1) Treatment for patients that renders the patients incapable of taking action for self-preservation under emergency conditions without assistance of others.
- (2) Anesthesia that renders the patients incapable of taking action for self-preservation under emergency conditions without the assistance of others.

Ambulatory health care occupancies, including outpatient surgery centers, freestanding emergency medical centers, and hemodialysis units, are subject to the requirements of Part II of Article 517 and 517.45. This definition, which correlates with the definition of the same term in NFPA 99, *Standard for Health Care Facilities*, recognizes that some emergency or urgent care may be performed at ambulatory health care occupancies.

- (3) Emergency or urgent care for patients who, due to the nature of their injury or illness, are incapable of taking action for self-preservation under emergency conditions without the assistance of others. [101:3.3.168.1]

**Anesthetizing Location.** Any area of a facility that has been designated to be used for the administration of any flammable or nonflammable inhalation anesthetic agent in the course of examination or treatment, including the use of such agents for relative analgesia.

It is recognized that in an emergency it may be necessary to administer an anesthetic almost anywhere in a health care

facility. However, only those areas in a health care facility specifically set aside for administering anesthetics are required to meet the requirements of Part IV of Article 517. The provisions of Part IV are not intended to apply to administering analgesic or local anesthetics, such as might be used in minor medical or dental procedures.

The definition of *anesthetizing location* applies to areas where inhalation anesthetics are used for *relative analgesia*. The term *relative analgesia* (see definition of this term in 517.2) is sometimes referred to as “conscious sedation” and is a state of sedation in which the perception of pain is partially blocked but the patient does not lose consciousness. This form of anesthesia is commonly used by oral surgeons. For guidance on flammable anesthetizing locations, see Annex E of NFPA 99, *Standard for Health Care Facilities*.

**Battery-Powered Lighting Units.** Individual unit equipment for backup illumination consisting of the following:

- (1) Rechargeable battery
- (2) Battery-charging means
- (3) Provisions for one or more lamps mounted on the equipment, or with terminals for remote lamps, or both
- (4) Relaying device arranged to energize the lamps automatically upon failure of the supply to the unit equipment

**Critical Branch.** A subsystem of the emergency system consisting of feeders and branch circuits supplying energy to task illumination, special power circuits, and selected receptacles serving areas and functions related to patient care and that are connected to alternate power sources by one or more transfer switches during interruption of normal power source. [99:3.3.26]

**Electrical Life-Support Equipment.** Electrically powered equipment whose continuous operation is necessary to maintain a patient’s life. [99:3.3.37]

**Emergency System.** A system of circuits and equipment intended to supply alternate power to a limited number of prescribed functions vital to the protection of life and safety. [99:3.3.41]

The requirements for sizing a generator and feeder capacity for the essential electrical system in a health care facility are located in 517.30(D). Emergency systems in occupancies other than health care are installed primarily for life safety and building evacuation. The emergency systems in hospitals are for life safety systems as well as maintenance of power for critical patient care equipment and systems.

**Equipment System.** A system of circuits and equipment arranged for delayed, automatic, or manual connection to the alternate power source and that serves primarily 3-phase power equipment.

**Essential Electrical System.** A system comprised of alternate sources of power and all connected distribution systems and ancillary equipment, designed to ensure continuity of electrical power to designated areas and functions of a health care facility during disruption of normal power sources, and also to minimize disruption within the internal wiring system. [99:3.3.44]

**Exposed Conductive Surfaces.** Those surfaces that are capable of carrying electric current and that are unprotected, unenclosed, or unguarded, permitting personal contact. Paint, anodizing, and similar coatings are not considered suitable insulation, unless they are listed for such use.

**Fault Hazard Current.** See *Hazard Current*.

**Flammable Anesthetics.** Gases or vapors, such as fluroxene, cyclopropane, divinyl ether, ethyl chloride, ethyl ether, and ethylene, which may form flammable or explosive mixtures with air, oxygen, or reducing gases such as nitrous oxide.

**Flammable Anesthetizing Location.** Any area of the facility that has been designated to be used for the administration of any flammable inhalation anesthetic agents in the normal course of examination or treatment.

**Hazard Current.** For a given set of connections in an isolated power system, the total current that would flow through a low impedance if it were connected between either isolated conductor and ground.

**Fault Hazard Current.** The hazard current of a given isolated system with all devices connected except the line isolation monitor.

**Monitor Hazard Current.** The hazard current of the line isolation monitor alone.

**Total Hazard Current.** The hazard current of a given isolated system with all devices, including the line isolation monitor, connected.

**Health Care Facilities.** Buildings or portions of buildings in which medical, dental, psychiatric, nursing, obstetrical, or surgical care are provided. Health care facilities include, but are not limited to, hospitals, nursing homes, limited care facilities, clinics, medical and dental offices, and ambulatory care centers, whether permanent or movable.

The definitions of *hospital*, *nursing home*, *ambulatory health care facility*, and *limited care facility* correlate with

the corresponding definitions found in NFPA 101, *Life Safety Code*.

**Hospital.** A building or portion thereof used on a 24-hour basis for the medical, psychiatric, obstetrical, or surgical care of four or more inpatients. [101:3.3.124]

**Isolated Power System.** A system comprising an isolating transformer or its equivalent, a line isolation monitor, and its ungrounded circuit conductors.

**Isolation Transformer.** A transformer of the multiple-winding type, with the primary and secondary windings physically separated, which inductively couples its secondary winding(s) to circuit conductors connected to its primary winding(s).

**Life Safety Branch.** A subsystem of the emergency system consisting of feeders and branch circuits, meeting the requirements of Article 700 and intended to provide adequate power needs to ensure safety to patients and personnel, and that are automatically connected to alternate power sources during interruption of the normal power source. [99:3.3.96]

**Limited Care Facility.** A building or portion thereof used on a 24-hour basis for the housing of four or more persons who are incapable of self-preservation because of age; physical limitation due to accident or illness; or limitations such as mental retardation/developmental disability, mental illness, or chemical dependency. [99:3.3.97]

**Line Isolation Monitor.** A test instrument designed to continually check the balanced and unbalanced impedance from each line of an isolated circuit to ground and equipped with a built-in test circuit to exercise the alarm without adding to the leakage current hazard.

**Monitor Hazard Current.** See *Hazard Current*.

**Nurses' Stations.** Areas intended to provide a center of nursing activity for a group of nurses serving bed patients, where the patient calls are received, nurses are dispatched, nurses' notes written, inpatient charts prepared, and medications prepared for distribution to patients. Where such activities are carried on in more than one location within a nursing unit, all such separate areas are considered a part of the nurses' station.

**Nursing Home.** A building or portion of a building used on a 24-hour basis for the housing and nursing care of four or more persons who, because of mental or physical incapacity, might be unable to provide for their own needs and safety without the assistance of another person. [99:3.3.129]

**Patient Bed Location.** The location of a patient sleeping bed, or the bed or procedure table of a critical care area. [99:3.3.137]

**Patient Care Area.** Any portion of a health care facility wherein patients are intended to be examined or treated. Areas of a health care facility in which patient care is administered are classified as general care areas or critical care areas. The governing body of the facility designates these areas in accordance with the type of patient care anticipated and with the following definitions of the area classification.

Informational Note: Business offices, corridors, lounges, day rooms, dining rooms, or similar areas typically are not classified as patient care areas.

**General Care Areas.** Patient bedrooms, examining rooms, treatment rooms, clinics, and similar areas in which it is intended that the patient will come in contact with ordinary appliances such as a nurse call system, electric beds, examining lamps, telephones, and entertainment devices. [99, 2005]

**Critical Care Areas.** Those special care units, intensive care units, coronary care units, angiography laboratories, cardiac catheterization laboratories, delivery rooms, operating rooms, and similar areas in which patients are intended to be subjected to invasive procedures and connected to line-operated, electromedical devices.

**Wet Procedure Locations.** Those spaces within patient care areas where a procedure is performed and that are normally subject to wet conditions while patients are present. These include standing fluids on the floor or drenching of the work area, either of which condition is intimate to the patient or staff. Routine housekeeping procedures and incidental spillage of liquids do not define a wet **procedure** location.

The definition of *patient care area* applies to hospitals as well as patient care areas in outpatient or other types of health care facilities. A patient bed location in a nursing home can be considered a patient care area if a person is examined or treated in that location.

*Wet procedure locations* may also include such areas as hydrotherapy areas, dialysis laboratories, and certain wet laboratories at the discretion of the governing body of the facility. However, it is intended to exclude areas such as lavatories or bathrooms within a health care facility. For infection control purposes, many patient and treatment areas have a sink for hand washing, which also is not intended to be a wet procedure location.

**Patient Care Vicinity.** In an area in which patients are normally cared for, the *patient care vicinity* is the space with surfaces likely to be contacted by the patient or an attendant

who can touch the patient. Typically in a patient room, this encloses a space within the room not less than 1.8 m (6 ft) beyond the perimeter of the bed in its nominal location, and extending vertically not less than 2.3 m (7½ ft) above the floor. [99:3.3.140]

The patient care vicinity is limited to patient beds in their normal location, that is, the location of the bed as called for in the architect's plans, rather than the temporary location of the bed subject to movement by housekeeping staff or for the convenience of the medical staff. An operating room, where patients are subject to invasive procedures, is a critical care area. See Exhibit 517.1.

**Patient Equipment Grounding Point.** A jack or terminal that serves as the collection point for redundant grounding of electrical appliances serving a patient care vicinity or for grounding other items in order to eliminate electromagnetic interference problems. [99:3.3.141]

**Psychiatric Hospital.** A building used exclusively for the psychiatric care, on a 24-hour basis, of four or more inpatients.

**Reference Grounding Point.** The ground bus of the panel-board or isolated power system panel supplying the patient care area.

**Relative Analgesia.** A state of sedation and partial block of pain perception produced in a patient by the inhalation of concentrations of nitrous oxide insufficient to produce loss of consciousness (conscious sedation).

**Selected Receptacles.** A minimum number of electrical receptacles to accommodate appliances ordinarily required for local tasks or likely to be used in patient care emergencies.

**Task Illumination.** Provision for the minimum lighting required to carry out necessary tasks in the described areas, including safe access to supplies and equipment, and access to exits.

**Therapeutic High-Frequency Diathermy Equipment.** Therapeutic high-frequency diathermy equipment is therapeutic induction and dielectric heating equipment.

**Total Hazard Current.** See *Hazard Current*.

**X-Ray Installations, Long-Time Rating.** A rating based on an operating interval of 5 minutes or longer.

**X-Ray Installations, Mobile.** X-ray equipment mounted on a permanent base with wheels, casters, or a combination of both to facilitate moving the equipment while completely assembled.

**X-Ray Installations, Momentary Rating.** A rating based on an operating interval that does not exceed 5 seconds.

**EXHIBIT 517.1** An operating room where patients are connected to line-operated electro-medical devices while undergoing invasive procedures. (Courtesy of the International Association of Electrical Inspectors)

**X-Ray Installations, Portable.** X-ray equipment designed to be hand carried.

**X-Ray Installations, Transportable.** X-ray equipment to be conveyed by a vehicle or that is readily disassembled for transport by a vehicle.

## II. Wiring and Protection

### Formal Interpretation 99-1

*Reference:* Article 517, Part II

*Question:* Does Part II of Article 517 of the *NEC* apply to patient sleeping rooms of nursing homes or limited care facilities where patient care activities do not involve the use of electrical or electronic life support systems; or invasive procedures where patients are electrically connected to line connected electromedical devices?

*Answer:* No

*Issue Edition:* 1999

*Reference:* Article 517

*Issue Date:* August 1, 2000

*Effective Date:* August 21, 2000

### 517.10 Applicability

**(A) Applicability.** Part II shall apply to patient care areas of all health care facilities.

The *Code* assigns responsibility for the designation of the types of patient care areas to the governing body of the health care facility. Both the design and the inspection of a patient care area, therefore, must be based on the governing body's designation rather than the superficial appearance of the area.

**(B) Not Covered.** Part II shall not apply to the following:

- (1) Business offices, corridors, waiting rooms, and the like in clinics, medical and dental offices, and outpatient facilities
- (2) Areas of nursing homes and limited care facilities wired in accordance with Chapters 1 through 4 of this *Code* where these areas are used exclusively as patient sleeping rooms

Informational Note: See NFPA 101®-2009, *Life Safety Code*®.

Areas in nursing homes that are designated as patient sleeping rooms are not considered to be patient care areas, even

though residents may require assistance to attend to their personal needs and safety. However, areas of nursing homes, including patient bedrooms, in which it is intended that residents be examined or treated can be considered examining rooms and are classified in the broader category as general care areas for patients. See the definition of *patient care area* in 517.2. See the Formal Interpretation on Article 517, Part II applicability.

### 517.11 General Installation — Construction Criteria

The purpose of this article is to specify the installation criteria and wiring methods that minimize electrical hazards by the maintenance of adequately low potential differences only between exposed conductive surfaces that are likely to become energized and could be contacted by a patient.

**Informational Note:** In a health care facility, it is difficult to prevent the occurrence of a conductive or capacitive path from the patient's body to some grounded object, because that path may be established accidentally or through instrumentation directly connected to the patient. Other electrically conductive surfaces that may make an additional contact with the patient, or instruments that may be connected to the patient, then become possible sources of electric currents that can traverse the patient's body. The hazard is increased as more apparatus is associated with the patient, and, therefore, more intensive precautions are needed. Control of electric shock hazard requires the limitation of electric current that might flow in an electrical circuit involving the patient's body by raising the resistance of the conductive circuit that includes the patient, or by insulating exposed surfaces that might become energized, in addition to reducing the potential difference that can appear between exposed conductive surfaces in the patient care vicinity, or by combinations of these methods. A special problem is presented by the patient with an externalized direct conductive path to the heart muscle. The patient may be electrocuted at current levels so low that additional protection in the design of appliances, insulation of the catheter, and control of medical practice is required.

Section 517.11 and its informational note recognize the possibility of increased sensitivity to electric shock by patients whose body resistance may be compromised either accidentally or by a necessary medical procedure. For example, incontinence or the insertion of a catheter may render a patient much more vulnerable to the effects of an electric current. Therefore, it is essential that those responsible for the design, installation, and maintenance of the electrical system in patient care areas be well acquainted with at least the rudiments of the hazard as explained in this note.

Since the original recognition of this hazard in the 1971 *Code*, continued clinical evaluation of the problem has provided a better understanding of the extent of the hazard,

bringing about the changes in wiring methods found in the *Code*.

### 517.12 Wiring Methods

Except as modified in this article, wiring methods shall comply with the applicable provisions of Chapters 1 through 4 of this *Code*.

### 517.13 Grounding of Receptacles and Fixed Electrical Equipment in Patient Care Areas

Wiring in patient care areas shall comply with 517.13(A) and (B).

**(A) Wiring Methods.** All branch circuits serving patient care areas shall be provided with an effective ground-fault current path by installation in a metal raceway system, or a cable having a metallic armor or sheath assembly. The metal raceway system, or metallic cable armor, or sheath assembly shall itself qualify as an equipment grounding conductor in accordance with 250.118.

The grounding requirements of 517.13(A) and (B) are not limited to hospitals. They are also required for patient care areas in other health care facilities, such as nursing homes, clinics, and medical and dental offices. The wiring method provisions of 517.13(A) apply to the branch circuits in areas used for patient care and are not limited to patient rooms. Additional areas, such as examining rooms, therapy areas, recreational areas, solariums, and certain patient corridors, are also included. The branch circuit wiring method used in these areas is one component of a two-part redundant grounding scheme unique to patient care areas. The metal raceway or metal cable armor or sheath must qualify as an equipment grounding conductor in accordance with 250.118, independent of the second component of this grounding scheme required by 517.13(B).

Metal-sheathed cable assemblies are not permitted as a general wiring method for emergency circuits because 517.30(C)(3) requires such wiring to be protected by installation in metal raceways. However, listed flexible raceway and metal-sheathed cable assemblies are allowed for limited application in the emergency system where used in listed prefabricated headwalls, in office furnishings, or where they are fished into existing walls or ceilings and are not subject to physical damage. See 517.30(C)(3)(3).

### (B) Insulated Equipment Grounding Conductor.

**(1) General.** The following shall be directly connected to an insulated copper equipment grounding conductor that is

installed with the branch circuit conductors in the wiring methods as provided in 517.13(A).

- (1) The grounding terminals of all receptacles.
- (2) Metal boxes and enclosures containing receptacles.
- (3) All non-current-carrying conductive surfaces of fixed electrical equipment likely to become energized that are subject to personal contact, operating at over 100 volts.

These requirements cover the second component of the redundant grounding scheme. An insulated copper equipment grounding conductor, either solid or stranded, sized in accordance with 250.122 must be installed with the branch-circuit conductors in a wiring method that meets the provisions of 517.13(A). This is not intended to require that a separate insulated equipment grounding conductor be run to the branch-circuit panelboard where the feeder equipment grounding conductor is recognized per 250.118.

*Exception:* An insulated equipment bonding jumper that directly connects to the equipment grounding conductor is permitted to connect the box and receptacle(s) to the equipment grounding conductor.

Connection of the equipment grounding conductor directly to a receptacle and its box, which typically has one grounding screw, is not common practice. The exception permits the installation of an insulated equipment bonding jumper to connect the receptacle and box to the equipment grounding conductor.

*Exception No. 1 to (3):* Metal faceplates shall be permitted to be connected to the equipment grounding conductor by means of a metal mounting screw(s) securing the faceplate to a grounded outlet box or grounded wiring device.

Exception No. 1 permits metal faceplates to be grounded by means of the metal mounting screws rather than by having a separate equipment grounding conductor or bonding jumper run to the metal plate. See 404.9(B), which requires switches and their metal faceplates to be effectively grounded.

*Exception No. 2 to (3):* Luminaires more than 2.3 m (7½ ft) above the floor and switches located outside of the patient care vicinity shall be permitted to be connected to an equipment grounding return path complying with 517.13(A).

Exception No. 2 exempts luminaires mounted 7½ ft above the floor and switches located outside the patient vicinity

from redundant grounding requirements because it is unlikely that a patient would contact these items or that an attendant would contact these items and a patient at the same time. The patient vicinity space consists of a volume 6 ft horizontally in all directions from the bed and vertically to 7½ ft above the floor.

**(2) Sizing.** Equipment grounding conductors and equipment bonding jumpers shall be sized in accordance with 250.122.

### 517.14 Panelboard Bonding

The equipment grounding terminal buses of the normal and essential branch-circuit panelboards serving the same individual patient care vicinity shall be connected together with an insulated continuous copper conductor not smaller than 10 AWG. Where two or more panelboards serving the same individual patient care vicinity are served from separate transfer switches on the emergency system, the equipment grounding terminal buses of those panelboards shall be connected together with an insulated continuous copper conductor not smaller than 10 AWG. This conductor shall be permitted to be broken in order to terminate on the equipment grounding terminal bus in each panelboard.

In order to minimize differences in potential on conductive surfaces subject to patient contact, the equipment grounding terminal bars of all panelboards supplying circuits that serve the same patient vicinity are required to be connected together using an insulated copper conductor not smaller than 10 AWG. This provision applies to panelboards supplied from different systems (normal and emergency) and to multiple panelboards supplied from the same system, but not necessarily from the same transfer switch, as is the case in many emergency distribution systems in order to meet system and branch separation requirements [see 517.30(C)(1)] or as part of a design approach to increase reliability of the power supply system.

### 517.16 Receptacles with Insulated Grounding Terminals

Receptacles with insulated grounding terminals, as described in 250.146(D), shall not be permitted.

This requirement prevents the use of insulated ground receptacles, which are intended to provide for the reduction of noise, as noted in 406.3(D), but because the equipment grounding terminal is isolated do not provide the functional benefit of the multiple equipment grounding paths specified

in 517.13. These receptacles are identified by an orange triangle located on the face of the receptacle.

### 517.17 Ground-Fault Protection

Wherever ground-fault protection of equipment (GFPE) is applied to the service providing power to a health care facility, whether by design or by reason of the requirements of 215.10 or 230.95, an additional level of ground-fault protection is required downstream. Under the provisions of 517.17(B), ground-fault protection must be applied to every feeder. At the option of the governing body of the health care facility, additional ground-fault protective devices may be applied farther downstream.

Unlike the requirements of 215.10 and 230.95 where mandatory GFPE is predicated on the rating of the disconnecting means (1000 amperes or more), the second level of GFPE is not based on the rating of the feeder disconnecting means, because the function of the second level of GFPE is to provide the desired selectivity between the feeder protective devices and the service or building supply protective devices. With proper ground-fault coordination per 517.17(C), this additional level of protection is intended to limit a ground fault to a single feeder and thereby prevent a total power outage of the entire health facility. Coordination includes consideration of the trip setting, the time setting, and the time required for operation (opening time) of each level of the ground-fault protection system.

The requirement for providing two levels of ground-fault protection includes health care facilities that are located in multiple-occupancy buildings. These multiple-occupancy buildings may be multiple medical office or clinic-type occupancies or may be multiple occupancies of mixed use in which one or more of the occupancies are health care facilities. As discussed, the selectivity required by 517.17(C) is accomplished through the installation of GFPE for all feeder disconnecting means in the first level of distribution downstream of the GFPE-protected service equipment or building disconnecting means specified in 215.10 or 230.95. Therefore, any feeder supplied from this level of distribution will be required to have GFPE regardless of the occupancy type or use group.

Note that the requirement for the second level of GFPE does not apply to all health care facilities located in multiple-occupancy buildings. Application of this requirement applies only where the health care facility governing authority has classified certain portions of the facility as critical care areas or where the types of procedures for which the facility is approved or licensed requires the use of life support equipment. If there are no designated critical care areas or life support equipment is not used, second level GFPE is

not required. Based on these criteria, most general medical and dental practices located in multiple-occupancy buildings are not impacted by this requirement. In addition, if the service is not provided with GFPE (either because it is not required by the *Code* or, if optional, has not been incorporated as part of the design), then, of course, the second level of GFPE becomes moot.

In the case of existing multiple-occupancy buildings that have GFPE for the service equipment, a tenant fit-up or renovation for a new health care occupancy may result in the need to also provide second-level GFPE for the feeders supplying all other occupancy types in order to provide the selectivity of GFPE operation required by this section. Careful analysis of the impact of this requirement on the existing service equipment may warrant an alternative approach such as installation of another service if permitted under the provisions of 230.2(A) through (D).

In accordance with 517.45, health care facilities, such as clinics or ambulatory care facilities, that use life support equipment or have areas designated as critical care are required to be provided with an essential electrical system that includes an alternate power source. It is not intended that ground-fault protection be installed between the on-site generator and the transfer switch or on the load side of the essential electrical system transfer switch. Informational Note No. 3 to 230.95(C) calls attention to problems that may arise when ground-fault-protected systems are transferred to another supply system.

**(A) Applicability.** The requirements of 517.17 shall apply to hospitals and other buildings (including multiple-occupancy buildings) with critical care areas or utilizing electrical life-support equipment, and buildings that provide the required essential utilities or services for the operation of critical care areas or electrical life-support equipment.

**(B) Feeders.** Where ground-fault protection is provided for operation of the service disconnecting means or feeder disconnecting means as specified by 230.95 or 215.10, an additional step of ground-fault protection shall be provided in all next level feeder disconnecting means downstream toward the load. Such protection shall consist of overcurrent devices and current transformers or other equivalent protective equipment that shall cause the feeder disconnecting means to open.

The additional levels of ground-fault protection shall not be installed on the load side of an essential electrical system transfer switch.

**(C) Selectivity.** Ground-fault protection for operation of the service and feeder disconnecting means shall be fully selective such that the feeder device, but not the service device, shall open on ground faults on the load side of the

feeder device. Separation of ground-fault protection time-current characteristics shall conform to manufacturer's recommendations and shall consider all required tolerances and disconnect operating time to achieve 100 percent selectivity.

See 230.95(C) and its commentary for information on ground-fault selectivity and performance testing.

Informational Note: See 230.95, fine print note, for transfer of alternate source where ground-fault protection is applied.

**(D) Testing.** When equipment ground-fault protection is first installed, each level shall be performance tested to ensure compliance with 517.17(C).

## 517.18 General Care Areas

**(A) Patient Bed Location.** Each patient bed location shall be supplied by at least two branch circuits, one from the emergency system and one from the normal system. All branch circuits from the normal system shall originate in the same panelboard.

The branch circuit serving patient bed locations shall not be part of a multi-wire branch circuit.

*Exception No. 1: Branch circuits serving only special-purpose outlets or receptacles, such as portable X-ray outlets, shall not be required to be served from the same distribution panel or panels.*

*Exception No. 2: Requirements of 517.18(A) shall not apply to patient bed locations in clinics, medical and dental offices, and outpatient facilities; psychiatric, substance abuse, and rehabilitation hospitals; sleeping rooms of nursing homes and limited care facilities meeting the requirements of 517.10(B)(2).*

*Exception No. 3: A general care patient bed location served from two separate transfer switches on the emergency system shall not be required to have circuits from the normal system.*

Patient bed locations in general care areas are prohibited from deriving all their branch circuits from the emergency system, and at least one branch circuit for each location must originate in a normal system panelboard. This supply circuit arrangement correlates with the limitations imposed by 517.33 regarding the types of loads permitted to be supplied by the critical branch of the emergency system.

Disconnecting means for multiwire branch circuits are required by 210.4(B) to simultaneously disconnect all ungrounded conductors. This mode of operation could result in unintended and potentially dangerous interruption of power to lighting or receptacle loads at a patient bed location.

Because of this concern, multiwire branch circuits are not permitted to be used to meet the requirements of 517.18(A).

Exception No. 3 allows both of the two required branch circuits for the general care area to be supplied by the emergency system, provided they are supplied by two separate transfer switches. A normal branch circuit is not required in this case. Two emergency branch circuits have a higher reliability than one normal and one emergency branch circuit.

**(B) Patient Bed Location Receptacles.** Each patient bed location shall be provided with a minimum of four receptacles. They shall be permitted to be of the single, duplex, or quadruplex type, or any combination of the three. All receptacles, whether four or more, shall be listed “hospital grade” and so identified. The grounding terminal of each receptacle shall be connected to an insulated copper equipment grounding conductor sized in accordance with Table 250.122.

*Exception No. 1: The requirements of 517.18(B) shall not apply to psychiatric, substance abuse, and rehabilitation hospitals meeting the requirements of 517.10(B)(2).*

*Exception No. 2: Psychiatric security rooms shall not be required to have receptacle outlets installed in the room.*

**Informational Note:** It is not intended that there be a total, immediate replacement of existing non-hospital grade receptacles. It is intended, however, that non-hospital grade receptacles be replaced with hospital grade receptacles upon modification of use, renovation, or as existing receptacles need replacement.

Hospital-grade single, duplex, or quadplex receptacles are required in general care patient bed locations. See the commentary following 517.19(B)(2) for more information on patient bed locations in critical care areas.

**(C) Pediatric Locations.** Receptacles located within the rooms, bathrooms, playrooms, activity rooms, and patient care areas of designated pediatric locations shall be listed tamper resistant or shall employ a listed tamper-resistant cover.

The receptacle safeguarding requirement covers all receptacles installed in rooms and patient care areas of pediatric locations. Safeguarding can be achieved through the use of either listed tamper-resistant receptacles or listed tamper-resistant covers, which preclude insertion of a conductive object into the energized parts of the receptacle. The use of locking covers over ordinary receptacles does not meet this requirement. Exhibit 517.2 shows a listed tamper-resistant receptacle that can be used to comply with 517.18(C). Exhibit 517.3 shows a

**EXHIBIT 517.2** A tamper-resistant hospital-grade receptacle, identified by a green dot on its face, that fulfills the requirements of 517.18(B) and (C). (Courtesy of Legrand/Pass & Seymour®)

**EXHIBIT 517.3** Hospital grade tamper-resistant GFCI in a hospital environment. (Courtesy of Legrand/Pass & Seymour®)

listed tamper-resistant, hospital grade, GFCI receptacle installed adjacent to a bathroom sink in a pediatric ward.

### 517.19 Critical Care Areas

**(A) Patient Bed Location Branch Circuits.** Each patient bed location shall be supplied by at least two branch circuits, one or more from the emergency system and one or more circuits from the normal system. At least one branch circuit from the emergency system shall supply an outlet(s) only at that bed location. All branch circuits from the normal system shall be from a single panelboard. Emergency system receptacles shall be identified and shall also indicate the panelboard and circuit number supplying them.

The branch circuit serving patient bed locations shall not be part of a multi-wire branch circuit.

*Exception No. 1: Branch circuits serving only special-purpose receptacles or equipment in critical care areas shall be permitted to be served by other panelboards.*

*Exception No. 2: Critical care locations served from two separate transfer switches on the emergency system shall not be required to have circuits from the normal system.*

Each patient bed location must be served by receptacles supplied from the normal system as well as the emergency system. The emergency system receptacles are required to be labeled with the panelboard and the circuit supplying them. They are also required to be identified as being supplied from the emergency system, which is often accomplished through the use of a color code for receptacles established for that facility (the color red is used in many health care facilities to identify receptacles supplied by the emergency system), as illustrated in Exhibit 517.4.

Disconnecting means for multiwire branch circuits are required by 210.4(B) to simultaneously disconnect all ungrounded conductors. This mode of operation could result in unintended and potentially dangerous interruption of power to lighting or receptacle loads at a patient bed location. Because of this concern, these circuits are not permitted to be used to meet the requirements of 517.19(A). Exception No. 2 covers the special case in which two separate transfer switches supply a single patient care area. Branch circuits supplied from two separate transfer switches provide an equivalent level of redundancy to that specified by the main requirement.

### (B) Patient Bed Location Receptacles.

**(1) Minimum Number and Supply.** Each patient bed location shall be provided with a minimum of six receptacles, at least one of which shall be connected to either of the following:

**EXHIBIT 517.4** A receptacle from the normal system (left) and the emergency system (right). Note the label that indicates the panelboard and the circuit number. (Courtesy of the International Association of Electrical Inspectors)

- (1) The normal system branch circuit required in 517.19(A)
- (2) An emergency system circuit supplied by a different transfer switch than the other receptacles at the same patient bed location

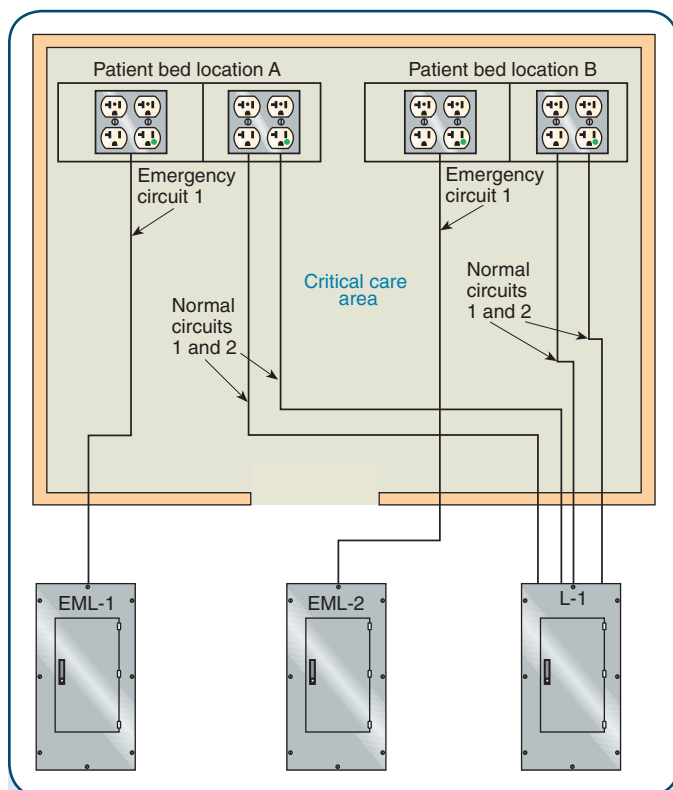

**(2) Receptacle Requirements.** The receptacles required in 517.19(B)(1) shall be permitted to be single, duplex, or quadplex type or any combination thereof. All receptacles shall be listed “hospital grade” and shall be so identified. The grounding terminal of each receptacle shall be connected to the reference grounding point by means of an insulated copper equipment grounding conductor.

Just as 517.19(A) specifies the number and type of branch circuits required for patient bed locations in critical care areas, 517.19(B) specifies the number of receptacles and the type of circuits supplying them. Each patient bed location must be provided with at least six receptacles that may be of the single, duplex, or quadplex type, provided they are listed hospital-grade type and are identified as such, typically with a green dot (shown in Exhibit 517.2).

Each patient bed location in critical care areas must be supplied by at least two branch circuits, one from the normal panel and one from the emergency panel, as shown in Exhibit 517.5. The normal circuits must be supplied from the same panel (L-1). The emergency circuits are permitted to be supplied from different panels (EML-1 and EML-2). However, the emergency branch circuit to patient bed location A cannot supply emergency receptacles for patient bed location B.

Patient bed location receptacles can also be supplied by two different emergency circuits, instead of one emergency and one normal, provided the emergency circuits are sup-

**EXHIBIT 517.5** Examples of normal and emergency circuits supplying patient bed locations in a critical care area.

plied from two different emergency transfer switches. The requirements for the number and type of branch circuits in critical care areas are intended to ensure that critical care patients will not be without electrical power regardless of whether the equipment, the branch circuits, or the normal system itself is at fault.

**(C) Patient Care Vicinity Grounding and Bonding (Optional).** A patient care vicinity shall be permitted to have a patient equipment grounding point. The patient equipment grounding point, where supplied, shall be permitted to contain one or more listed grounding and bonding jacks. An equipment bonding jumper not smaller than 10 AWG shall be used to connect the grounding terminal of all grounding-type receptacles to the patient equipment grounding point. The bonding conductor shall be permitted to be arranged centrally or looped as convenient.

A patient vicinity is permitted to have a patient equipment grounding point with multiple grounding or bonding jacks. See Exhibit 517.6.

Informational Note: Where there is no patient equipment grounding point, it is important that the distance between

**EXHIBIT 517.6** A patient equipment grounding point. (Courtesy of the International Association of Electrical Inspectors)

the reference grounding point and the patient care vicinity be as short as possible to minimize any potential differences.

**(D) Equipment Grounding and Bonding.** Where a grounded electrical distribution system is used and metal feeder raceway or Type MC or MI cable that qualifies as an equipment grounding conductor in accordance with 250.118 is installed, grounding of enclosures and equipment, such as panelboards and switchboards, shall be ensured by one of the following bonding means at each termination or junction point of the metal raceway or Type MC or MI cable:

- (1) A grounding bushing and a continuous copper bonding jumper, sized in accordance with 250.122, with the bonding jumper connected to the junction enclosure or the ground bus of the panel
- (2) Connection of feeder raceways or Type MC or MI cable to threaded hubs or bosses on terminating enclosures
- (3) Other approved devices such as bonding-type locknuts or bushings

**(E) Additional Protective Techniques in Critical Care Areas (Optional).** Isolated power systems shall be permitted to be used for critical care areas, and, if used, the isolated power system equipment shall be listed as isolated power equipment. The isolated power system shall be designed and installed in accordance with 517.160.

*Exception: The audible and visual indicators of the line isolation monitor shall be permitted to be located at the nursing station for the area being served.*

**(F) Isolated Power System Equipment Grounding.** Where an isolated ungrounded power source is used and limits the

first-fault current to a low magnitude, the equipment grounding conductor associated with the secondary circuit shall be permitted to be run outside of the enclosure of the power conductors in the same circuit.

Installing the grounding conductor inside the raceway with the conductors delivering the fault current reduces the impedance of the grounding path.

Informational Note: Although it is permitted to run the grounding conductor outside of the conduit, it is safer to run it with the power conductors to provide better protection in case of a second ground fault.

**(G) Special-Purpose Receptacle Grounding.** The equipment grounding conductor for special-purpose receptacles, such as the operation of mobile X-ray equipment, shall be extended to the reference grounding points of branch circuits for all locations likely to be served from such receptacles. Where such a circuit is served from an isolated ungrounded system, the grounding conductor shall not be required to be run with the power conductors; however, the equipment grounding terminal of the special-purpose receptacle shall be connected to the reference grounding point.

## 517.20 Wet Procedure Locations

**(A) Receptacles and Fixed Equipment.** Wet procedure location patient care areas shall be provided with special protection against electric shock by one of the following means:

The location may only be wet while the procedure is taking place. In areas that are designated wet procedure locations by the governing body of the facility, there are two types of systems permitted. The first is a system that inherently limits the ground-fault current without interrupting the power supply. A common system of this type is an isolated power system (see Part VII). The second system interrupts the power supply if the ground-fault current exceeds 6 mA. This type of system typically utilizes GFCI protection.

- (1) Power distribution system that inherently limits the possible ground-fault current due to a first fault to a low value, without interrupting the power supply
- (2) Power distribution system in which the power supply is interrupted if the ground-fault current does, in fact, exceed a value of 6 mA

*Exception: Branch circuits supplying only listed, fixed, therapeutic and diagnostic equipment shall be permitted to be supplied from a grounded service, single- or 3-phase system, provided that*

- (a) *Wiring for grounded and isolated circuits does not occupy the same raceway, and*
- (b) *All conductive surfaces of the equipment are connected to an insulated copper equipment grounding conductor.*

**(B) Isolated Power Systems.** Where an isolated power system is utilized, the isolated power equipment shall be listed as isolated power equipment, and the isolated power system shall be designed and installed in accordance with 517.160.

Informational Note: For requirements for installation of therapeutic pools and tubs, see Part VI of Article 680.

## 517.21 Ground-Fault Circuit-Interrupter Protection for Personnel

Ground-fault circuit-interrupter protection for personnel shall not be required for receptacles installed in those critical care areas where the toilet and basin are installed within the patient room.

This does not apply to receptacles installed in bathrooms in critical care areas. Since patients in critical care areas are bedridden, bathroom accommodations for patients are not the same as those in other patient areas. Because of the unique use of the bathroom facility in critical care areas, only those receptacles in this specific location are exempt from the GFCI requirement. This provision does not exempt the requirements of 210.8(B)(1) for GFCI-protected receptacles in other bathrooms for patients, staff, or the public.

## III. Essential Electrical System

### 517.25 Scope

The essential electrical system for these facilities shall comprise a system capable of supplying a limited amount of lighting and power service, which is considered essential for life safety and orderly cessation of procedures during the time normal electrical service is interrupted for any reason. This includes clinics, medical and dental offices, outpatient facilities, nursing homes, limited care facilities, hospitals, and other health care facilities serving patients.

Informational Note: For information on the need for an essential electrical system, see NFPA 99-2005, *Standard for Health Care Facilities*.

### 517.26 Application of Other Articles

The essential electrical system shall meet the requirements of Article 700, except as amended by Article 517.

In larger health care facilities, the requirements of 700.5(D) and 517.30(B)(4) correlate from the perspective that there is

one or more transfer switches that supply only emergency loads. However, 517.30(B)(4) also differs from 700.5 in smaller facilities with a maximum demand on the essential electrical system of 150 kVA or less. In those cases, a single transfer switch is permitted to supply the entire essential electrical system including loads that are not part of the emergency system. This is an example of where a requirement in Article 517 differs from a requirement in Article 700, and Article 517 takes precedence as is specified in 517.26.

Similar to the physical separation requirements for emergency systems specified in 700.10(B), the physical separation requirements for circuits supplied by essential electrical systems (including the emergency system of a hospital) are covered in 517.30(C)(1) for hospitals and 517.41(D) for nursing homes and limited care facilities.

**Informational Note:** The provisions of NFPA 110-2010, *Standard for Emergency and Standby Power Systems*, should be considered when designing and installing essential electrical power supply systems.

### 517.30 Essential Electrical Systems for Hospitals

**(A) Applicability.** The requirements of Part III, 517.30 through 517.35, shall apply to hospitals where an essential electrical system is required.

**Informational Note No. 1:** For performance, maintenance, and testing requirements of essential electrical systems in hospitals, see NFPA 99-2005, *Standard for Health Care Facilities*. For installation of centrifugal fire pumps, see NFPA 20-2010, *Standard for the Installation of Stationary Fire Pumps for Fire Protection*.

**Informational Note No. 2:** For additional information, see NFPA 99-2005, *Standard for Health Care Facilities*.

#### (B) General.

**(1) Separate Systems.** Essential electrical systems for hospitals shall be comprised of two separate systems capable of supplying a limited amount of lighting and power service that is considered essential for life safety and effective hospital operation during the time the normal electrical service is interrupted for any reason. These two systems shall be the emergency system and the equipment system.

**(2) Emergency Systems.** The emergency system shall be limited to circuits essential to life safety and critical patient care. These are designated the life safety branch and the critical branch. [99:4.4.2.2.1.1]

**(3) Equipment System.** The equipment system shall supply major electrical equipment necessary for patient care and basic hospital operation.

**(4) Transfer Switches.** The number of transfer switches to be used shall be based on reliability, design, and load considerations. Each branch of the emergency system and each equipment system shall have one or more transfer switches. One transfer switch shall be permitted to serve one or more branches or systems in a facility with a maximum demand on the essential electrical system of 150 kVA.

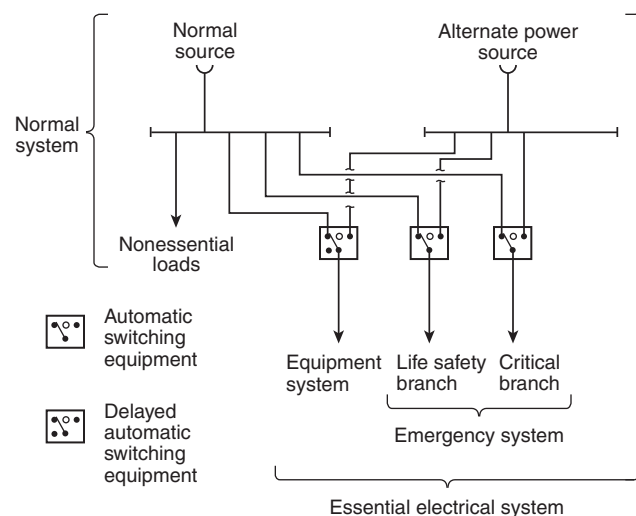

**Informational Note No. 1:** See NFPA 99-2005, *Standard for Health Care Facilities*: 4.4.3.2, Transfer Switch Operation Type I; 4.4.2.1.4, Automatic Transfer Switch Features; and 4.4.2.1.6, Nonautomatic Transfer Device Features.

**Informational Note No. 2:** See Informational Note Figure 517.30, No. 1.

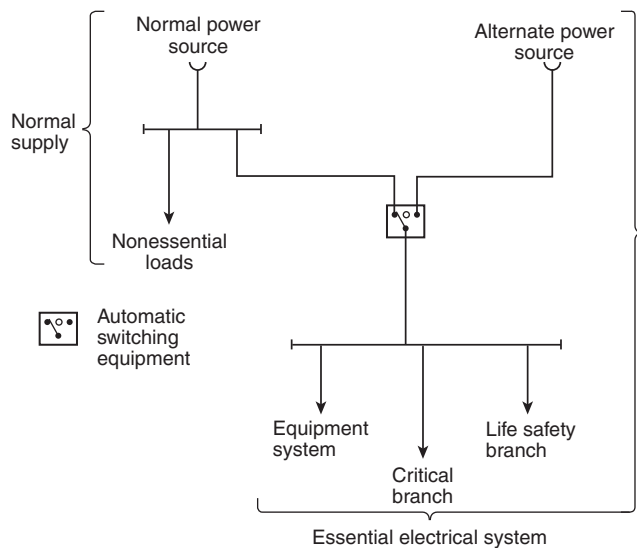

**Informational Note No. 3:** See Informational Note Figure 517.30, No. 2.

For a small electrical system having a maximum demand on the essential electrical system of 150 kVA, see Informational Note Figure 517.30, No. 2. A small load can be served by a single transfer switch that can handle the loads associated with both the emergency system and the equipment system. This, of course, is based on the assumption that the transfer switch has sufficient capacity to handle the combined loads and that the alternate source of power is sufficiently large to withstand the impact of the simultaneous transfer of both systems in the event of a normal power loss. For further explanation of loads permitted on an emergency system, see NFPA 99, *Standard for Health Care Facilities*.

**(5) Optional Loads.** Loads served by the generating equipment not specifically named in Article 517 shall be

**INFORMATIONAL NOTE FIGURE 517.30, NO. 1**  
Hospital — Minimum Requirement (greater than 150 kVA)  
for Transfer Switch Arrangement.

**INFORMATIONAL NOTE FIGURE 517.30, NO. 2**  
**Hospital — Minimum Requirement (150 kVA or less) for**  
**Transfer Switch Arrangement.**

served by their own transfer switches such that the following conditions apply:

- (1) These loads shall not be transferred if the transfer will overload the generating equipment.
- (2) These loads shall be automatically shed upon generating equipment overloading.

**(6) Contiguous Facilities.** Hospital power sources and alternate power sources shall be permitted to serve the essential electrical systems of contiguous or same site facilities. [99:13.3.4.3]

**(C) Wiring Requirements.**

**(1) Separation from Other Circuits.** The life safety branch and critical branch of the emergency system shall be kept entirely independent of all other wiring and equipment and shall not enter the same raceways, boxes, or cabinets with each other or other wiring.

Where general care locations are served from two separate transfer switches on the emergency system in accordance with 517.18(A), Exception No. 3, the general care circuits from the two separate systems shall be kept independent of each other.

Where critical care locations are served from two separate transfer switches on the emergency system in accordance with 517.19(A), Exception No. 2, the critical care circuits from the two separate systems shall be kept independent of each other.

Wiring of the life safety branch and the critical branch shall be permitted to occupy the same raceways, boxes, or

cabinets of other circuits not part of the branch where such wiring complies with one of the following:

- (1) Is in transfer equipment enclosures
- (2) Is in exit or emergency luminaires supplied from two sources
- (3) Is in a common junction box attached to exit or emergency luminaires supplied from two sources
- (4) Is for two or more emergency circuits supplied from the same branch and same transfer switch

The wiring of the equipment system shall be permitted to occupy the same raceways, boxes, or cabinets of other circuits that are not part of the emergency system.

The life safety branch and critical branch of the emergency system are required to be kept entirely independent of all other wiring and equipment and not enter the same raceways, boxes, or cabinets with each other or other wiring.

Where general care or critical care locations are supplied from two transfer switches on an emergency system, the separate feeder and branch circuits are to be kept independent of each other. The issue of a failure in one circuit affecting the other is the same whether there is a normal and an emergency circuit or two emergency circuits.

Multiple branch circuits supplied from the same branch and transfer switch of the emergency system are permitted to be enclosed in a common raceway or enclosure by 517.30(C)(1)(4).

**(2) Isolated Power Systems.** Where isolated power systems are installed in any of the areas in 517.33(A)(1) and (A)(2), each system shall be supplied by an individual circuit serving no other load.

**(3) Mechanical Protection of the Emergency System.** The wiring of the emergency systems in hospitals shall be mechanically protected. Where installed as branch circuits in patient care areas, the installation shall comply with the requirements of 517.13(A) and (B). The following wiring methods shall be permitted:

To help ensure reliability of power delivery to life safety and patient care equipment, the wiring of emergency systems requires additional protection against mechanical damage that is not normally mandated for other occupancies. Emergency system circuits can include services under the condition specified in 517.35(B)(3), feeders, and branch circuits. As described in 517.31, the emergency system in a hospital consists of the life safety branch and the critical branch.

- (1) Nonflexible metal raceways, Type MI cable, or Schedule 80 PVC conduit. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.
- (2) Where encased in not less than 50 mm (2 in.) of concrete, Schedule 40 PVC conduit, flexible nonmetallic or jacketed metallic raceways, or jacketed metallic cable assemblies listed for installation in concrete. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.
- (3) Listed flexible metal raceways and listed metal sheathed cable assemblies in any of the following:
  - a. Where used in listed prefabricated medical headwalls
  - b. In listed office furnishings
  - c. Where fished into existing walls or ceilings, not otherwise accessible and not subject to physical damage
  - d. Where necessary for flexible connection to equipment
- (4) Flexible power cords of appliances or other utilization equipment connected to the emergency system.
- (5) Cables for Class 2 or Class 3 systems permitted by Part VI of this Article, with or without raceways.

Informational Note: See 517.13 for additional grounding requirements in patient care areas.

Some conditions do not require the installation of conductors in nonflexible metal raceways. Section 517.30(C)(3) (4) permits fishing flexible metal raceways and metal sheathed cables in existing installations. This provision facilitates installations in renovated areas where the existing walls or ceilings remain intact. The secondary conductors of limited energy systems, such as nurse call, telephone, and alarm circuits, are exempt from being run in raceways, provided they comply with their applicable articles elsewhere in the *Code*. Although this requirement allows substantial latitude in the wiring method, the restrictions of 300.22 (ducts, plenums, and other air-handling spaces) apply, unless cables specifically listed for use in these environments are used.

**(D) Capacity of Systems.** The essential electrical system shall have adequate capacity to meet the demand for the operation of all functions and equipment to be served by each system and branch.

Feeders shall be sized in accordance with Articles 215 and 220. The generator set(s) shall have sufficient capacity and proper rating to meet the demand produced by the load of the essential electrical system(s) at any given time.

Demand calculations for sizing of the generator set(s) shall be based on any of the following:

- (1) Prudent demand factors and historical data
- (2) Connected load
- (3) Feeder calculation procedures described in Article 220
- (4) Any combination of the above

The sizing requirements in 700.4 and 701.4 shall not apply to hospital generator set(s).

The sizing of generators is permitted to be based on actual demand likely to be produced by the connected load of the system at any one time. This method of calculation facilitates practical sizing of generators in health care facilities and helps eliminate prime mover operational problems associated with lightly loaded generators.

**(E) Receptacle Identification.** The cover plates for the electrical receptacles or the electrical receptacles themselves supplied from the emergency system shall have a distinctive color or marking so as to be readily identifiable. [99: 4.4.2.2.4.2(B)]

Cover plates or the receptacles themselves are required to be identified where supplied by the emergency system. This identification requirement applies to all receptacles supplied by the life safety and critical branches of the emergency system.

### 517.31 Emergency System

Those functions of patient care depending on lighting or appliances that are connected to the emergency system shall be divided into two mandatory branches: the life safety branch and the critical branch, described in 517.32 and 517.33.

The branches of the emergency system shall be installed and connected to the alternate power source so that all functions specified herein for the emergency system shall be automatically restored to operation within 10 seconds after interruption of the normal source. [99:4.4.2.2.2.1, 4.4.3.1]

### 517.32 Life Safety Branch

No function other than those listed in 517.32(A) through (H) shall be connected to the life safety branch. The life safety branch of the emergency system shall supply power for the following lighting, receptacles, and equipment.

**(A) Illumination of Means of Egress.** Illumination of means of egress, such as lighting required for corridors, passageways, stairways, and landings at exit doors, and all necessary ways of approach to exits. Switching arrangements to transfer patient corridor lighting in hospitals from general illumination circuits to night illumination circuits shall be permitted, provided only one of two circuits can be

selected and both circuits cannot be extinguished at the same time.

Informational Note: See NFPA 101-2009, *Life Safety Code*, Sections 7.8 and 7.9.

**(B) Exit Signs.** Exit signs and exit directional signs.

Informational Note: See NFPA 101-2009, *Life Safety Code*, Section 7.10.

**(C) Alarm and Alerting Systems.** Alarm and alerting systems including the following:

(1) Fire alarms

Informational Note: See NFPA 101-2009, *Life Safety Code*, Section 9.6 and 18.3.4.

(2) Alarms required for systems used for the piping of non-flammable medical gases

Informational Note: See NFPA 99-2005, *Standard for Health Care Facilities*, 4.4.2.2.2.2(3).

(3) Mechanical, control, and other accessories required for effective life safety systems operation shall be permitted to be connected to the life safety branch.

HVAC controls are permitted to be on the life safety branch because the operation of an HVAC system and associated dampers can impact smoke control and life safety.

**(D) Communications Systems.** Hospital communications systems, where used for issuing instructions during emergency conditions.

**(E) Generator Set and Transfer Switch Locations.** Task illumination battery charger for battery-powered lighting unit(s) and selected receptacles at the generator set and essential transfer switch locations. [99:4.4.2.2.2.2(5)]

**(F) Generator Set Accessories.** Generator set accessories as required for generator performance.

An example of an accessory is task illumination. The connection of a battery charger for task illumination lighting for transfer switch locations, in addition to generator locations, allows for servicing when the building is being supplied from the alternate source of the essential electrical system.

**(G) Elevators.** Elevator cab lighting, control, communications, and signal systems.

**(H) Automatic Doors.** Automatically operated doors used for building egress. [99:4.4.2.2.2.2(7)]

### 517.33 Critical Branch

**(A) Task Illumination and Selected Receptacles.** The critical branch of the emergency system shall supply power for task illumination, fixed equipment, selected receptacles, and special power circuits serving the following areas and functions related to patient care:

- (1) Critical care areas that utilize anesthetizing gases — task illumination, selected receptacles, and fixed equipment
- (2) The isolated power systems in special environments
- (3) Patient care areas — task illumination and selected receptacles in the following:
  - a. Infant nurseries
  - b. Medication preparation areas
  - c. Pharmacy dispensing areas
  - d. Selected acute nursing areas
  - e. Psychiatric bed areas (omit receptacles)
  - f. Ward treatment rooms
  - g. Nurses' stations (unless adequately lighted by corridor luminaires)
- (4) Additional specialized patient care task illumination and receptacles, where needed
- (5) Nurse call systems
- (6) Blood, bone, and tissue banks
- (7) Telephone equipment rooms and closets
- (8) Task illumination, selected receptacles, and selected power circuits for the following:
  - a. General care beds (at least one duplex receptacle in each patient bedroom)
  - b. Angiographic labs
  - c. Cardiac catheterization labs
  - d. Coronary care units
  - e. Hemodialysis rooms or areas
  - f. Emergency room treatment areas (selected)
  - g. Human physiology labs
  - h. Intensive care units
  - i. Postoperative recovery rooms (selected)
- (9) Additional task illumination, receptacles, and selected power circuits needed for effective hospital operation. Single-phase fractional horsepower motors shall be permitted to be connected to the critical branch. [99:4.4.2.2.2.3(9)]

The critical branch is intended to serve a limited number of receptacles and locations in order to reduce the load and minimize the chances of a fault condition. Receptacles in general patient care area corridors are permitted on the critical branch, but they must be identified in some manner (color-coded or labeled) as part of the emergency system, in accordance with 517.30(E).

**(B) Subdivision of the Critical Branch.** It shall be permitted to subdivide the critical branch into two or more branches.

**Informational Note:** It is important to analyze the consequences of supplying an area with only critical care branch power when failure occurs between the area and the transfer switch. Some proportion of normal and critical power or critical power from separate transfer switches may be appropriate.

### 517.34 Equipment System Connection to Alternate Power Source

The equipment system shall be installed and connected to the alternate power source such that the equipment described in 517.34(A) is automatically restored to operation at appropriate time-lag intervals following the energizing of the emergency system. Its arrangement shall also provide for the subsequent connection of equipment described in 517.34(B). [99:4.4.2.2.3.2]

*Exception:* For essential electrical systems under 150 kVA, deletion of the time-lag intervals feature for delayed automatic connection to the equipment system shall be permitted.

**(A) Equipment for Delayed Automatic Connection.** The following equipment shall be permitted to be arranged for delayed automatic connection to the alternate power source:

- (1) Central suction systems serving medical and surgical functions, including controls. Such suction systems shall be permitted on the critical branch.
- (2) Sump pumps and other equipment required to operate for the safety of major apparatus, including associated control systems and alarms.
- (3) Compressed air systems serving medical and surgical functions, including controls. Such air systems shall be permitted on the critical branch.
- (4) Smoke control and stair pressurization systems, or both.
- (5) Kitchen hood supply or exhaust systems, or both, if required to operate during a fire in or under the hood.
- (6) Supply, return, and exhaust ventilating systems for airborne infectious/isolation rooms, protective environment rooms, exhaust fans for laboratory fume hoods, nuclear medicine areas where radioactive material is used, ethylene oxide evacuation, and anesthesia evacuation. Where delayed automatic connection is not appropriate, such ventilation systems shall be permitted to be placed on the critical branch. [99:4.4.2.2.3.4(1) through (6)]
- (7) Supply, return, and exhaust ventilating systems for operating and delivery rooms.

Sections 517.34(A)(6) and (A)(7) permit a delay in connecting supply, return, and exhaust ventilating systems for the areas identified in these sections.

*Exception:* Sequential delayed automatic connection to the alternate power source to prevent overloading the generator shall be permitted where engineering studies indicate it is necessary.

**(B) Equipment for Delayed Automatic or Manual Connection.** The following equipment shall be permitted to be arranged for either delayed automatic or manual connection to the alternate power source:

- (1) Heating equipment to provide heating for operating, delivery, labor, recovery, intensive care, coronary care, nurseries, infection/isolation rooms, emergency treatment spaces, and general patient rooms and pressure maintenance (jockey or make-up) pump(s) for water-based fire protection systems.

*Exception:* Heating of general patient rooms and infection/isolation rooms during disruption of the normal source shall not be required under any of the following conditions:

- (1) The outside design temperature is higher than  $-6.7^{\circ}\text{C}$  ( $20^{\circ}\text{F}$ ).
- (2) The outside design temperature is lower than  $-6.7^{\circ}\text{C}$  ( $20^{\circ}\text{F}$ ), and where a selected room(s) is provided for the needs of all confined patients, only such room(s) need be heated.
- (3) The facility is served by a dual source of normal power.

**Informational Note No. 1:** The design temperature is based on the 97½ percent design value as shown in Chapter 24 of the ASHRAE *Handbook of Fundamentals* (1997).

A common practice in some areas is to install individual room heating/air conditioning rather than to have a central heating/air-conditioning plant. If these individual units are electrically powered, applying their high-demand load to the generator may not be practical. The provisions for limited heating during emergency conditions are based on consideration of outside design temperatures. Delayed connection of the loads listed in this section is optional, rather than mandatory. Many health care facilities have generators with sufficient capacity to pick up these loads during startup.

**Informational Note No. 2:** For a description of a dual source of normal power, see 517.35(C), Informational Note.

- (2) An elevator(s) selected to provide service to patient, surgical, obstetrical, and ground floors during interruption of normal power. In instances where interruption of normal power would result in other elevators stopping between floors, throw-over facilities shall be provided to allow the temporary operation of any elevator for the release of patients or other persons who may be confined between floors.

- (3) Hyperbaric facilities.
- (4) Hypobaric facilities.
- (5) Automatically operated doors
- (6) Minimal electrically heated autoclaving equipment shall be permitted to be arranged for either automatic or manual connection to the alternate source.
- (7) Controls for equipment listed in 517.34.
- (8) Other selected equipment shall be permitted to be served by the equipment system. [99:4.4.2.2.3.5(9)]

**(C) AC Equipment for Nondelayed Automatic Connection.** Generator accessories, including but not limited to, the transfer fuel pump, electrically operated louvers, and other generator accessories essential for generator operation, shall be arranged for automatic connection to the alternate power source. [99:4.4.2.2.3.3]

This provision, extracted from NFPA 99, *Standard for Health Care Facilities*, pertains to associated support equipment for proper operation of the emergency generator and requires this equipment to be connected to the alternate power source. Accessories essential to the operation of the generator also include illumination at the generator location.

### 517.35 Sources of Power

**(A) Two Independent Sources of Power.** Essential electrical systems shall have a minimum of two independent sources of power: a normal source generally supplying the entire electrical system and one or more alternate sources for use when the normal source is interrupted. [99:4.4.1.1.4]

**(B) Alternate Source of Power.** The alternate source of power shall be one of the following:

- (1) Generator(s) driven by some form of prime mover(s) and located on the premises
- (2) Another generating unit(s) where the normal source consists of a generating unit(s) located on the premises
- (3) An external utility service when the normal source consists of a generating unit(s) located on the premises
- (4) A battery system located on the premises [99:4.4.1.2]

**(C) Location of Essential Electrical System Components.** Careful consideration shall be given to the location of the spaces housing the components of the essential electrical system to minimize interruptions caused by natural forces common to the area (e.g., storms, floods, earthquakes, or hazards created by adjoining structures or activities). Consideration shall also be given to the possible interruption of normal electrical services resulting from similar causes as well as possible disruption of normal electrical service due to internal wiring and equipment failures.

**Informational Note:** Facilities in which the normal source of power is supplied by two or more separate central station-fed services experience greater than normal electrical service reliability than those with only a single feed. Such a dual source of normal power consists of two or more electrical services fed from separate generator sets or a utility distribution network that has multiple power input sources and is arranged to provide mechanical and electrical separation so that a fault between the facility and the generating sources is not likely to cause an interruption of more than one of the facility service feeders.

### 517.40 Essential Electrical Systems for Nursing Homes and Limited Care Facilities

NFPA 99, *Standard for Health Care Facilities*, recognizes two classes of nursing homes or limited care facilities. For the smaller, less complex facility, only a minimum alternate lighting and alarm service needs to be furnished.

At nursing homes or limited care facilities where patients are sustained by electrical life-support equipment or inpatient hospital care is provided, the requirements of 517.41 through 517.44 apply. Because the level of care is comparable to that provided in a hospital, the emergency system for this type of nursing home has the same subdivisions (life safety branch and critical branch) as is required for a hospital emergency system.

**(A) Applicability.** The requirements of Part III, 517.40(C) through 517.44, shall apply to nursing homes and limited care facilities.

*Exception: The requirements of Part III, 517.40(C) through 517.44, shall not apply to freestanding buildings used as nursing homes and limited care facilities, provided that the following apply:*

- (a) *Admitting and discharge policies are maintained that preclude the provision of care for any patient or resident who may need to be sustained by electrical life-support equipment.*
- (b) *No surgical treatment requiring general anesthesia is offered.*
- (c) *An automatic battery-operated system(s) or equipment is provided that shall be effective for at least 1½ hours and is otherwise in accordance with 700.12 and that shall be capable of supplying lighting for exit lights, exit corridors, stairways, nursing stations, medical preparation areas, boiler rooms, and communications areas. This system shall also supply power to operate all alarm systems. [99:17.3.4.2.2(3), 18.3.4.2.2(3)]*

**Informational Note:** See NFPA 101-2009, *Life Safety Code*.

**(B) Inpatient Hospital Care Facilities.** For those nursing homes and limited care facilities that admit patients

who need to be sustained by electrical life support equipment, the essential electrical system from the source to the portion of the facility where such patients are treated shall comply with the requirements of Part III, 517.30 through 517.35.

Regardless of the name given to a facility, the type of electrical system required corresponds with the level of patient care provided. If such care is clearly inpatient care requiring the use of life support equipment, a hospital-type essential electrical system must be installed. The type of care that can be provided at a nursing home or limited care facility is generally controlled through the administrative agency that licenses and regulates the facility.

**(C) Facilities Contiguous or Located on the Same Site with Hospitals.** Nursing homes and limited care facilities that are contiguous or located on the same site with a hospital shall be permitted to have their essential electrical systems supplied by that of the hospital.

If a nursing home or limited care facility shares the same building or campus with a hospital, the alternate supply of the hospital essential electrical system is permitted to be used as the alternate supply for the nursing home's essential electrical system. This provision allows for the use of a single alternate power plant to serve a single building or campus with multiple types of health care occupancies and is the same allowance as specified in 517.30(B)(6) for a campus having only hospital occupancies. The use of multiple alternate sources is permitted and may be desirable from the standpoint of reliability.

Informational Note: For performance, maintenance, and testing requirements of essential electrical systems in nursing homes and limited care facilities, see NFPA 99-2005, *Standard for Health Care Facilities*.

## 517.41 Essential Electrical Systems

**(A) General.** Essential electrical systems for nursing homes and limited care facilities shall be comprised of two separate branches capable of supplying a limited amount of lighting and power service, which is considered essential for the protection of life safety and effective operation of the institution during the time normal electrical service is interrupted for any reason. These two separate branches shall be the life safety branch and the critical branch. [99: A.4.5.2.2.1]

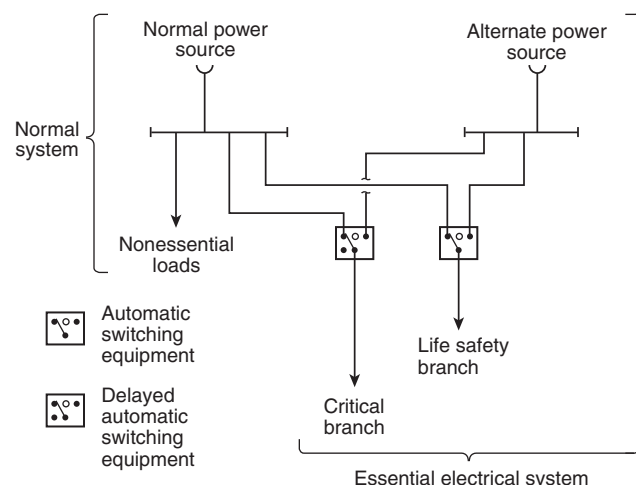

**(B) Transfer Switches.** The number of transfer switches to be used shall be based on reliability, design, and load considerations. Each branch of the essential electrical system

shall be served by one or more transfer switches. One transfer switch shall be permitted to serve one or more branches or systems in a facility with a maximum demand on the essential electrical system of 150 kVA. [99:4.5.2.2.1]

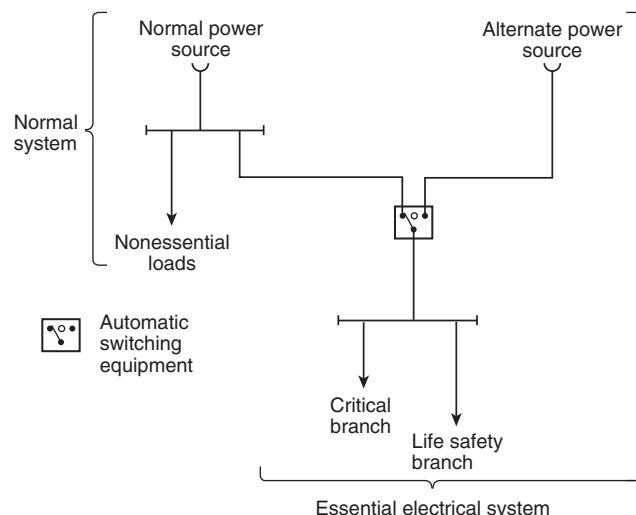

Informational Note No. 1: See NFPA 99-2005, *Standard for Health Care Facilities*, 4.5.3.2, Transfer Switch Operation Type II; 4.4.2.1.4, Automatic Transfer Switch Features; and 4.4.2.1.6, Nonautomatic Transfer Device Features.

Informational Note No. 2: See Informational Note Figure 517.41, No. 1.

Informational Note No. 3: See Informational Note Figure 517.41, No. 2.

**INFORMATIONAL NOTE FIGURE 517.41, NO. 1**  
Nursing Home and Limited Health Care Facilities —  
Minimum Requirement (greater than 150 kVA) for Transfer  
Switch Arrangement.

**INFORMATIONAL NOTE FIGURE 517.41, NO. 2**  
Nursing Home and Limited Health Care Facilities —  
Minimum Requirement (150 kVA or less) for Transfer Switch  
Arrangement.

**(C) Capacity of System.** The essential electrical system shall have adequate capacity to meet the demand for the operation of all functions and equipment to be served by each branch at one time.

**(D) Separation from Other Circuits.** The life safety branch shall be kept entirely independent of all other wiring and equipment and shall not enter the same raceways, boxes, or cabinets with other wiring except as follows:

- (1) In transfer switches
- (2) In exit or emergency luminaires supplied from two sources
- (3) In a common junction box attached to exit or emergency luminaires supplied from two sources

The wiring of the critical branch shall be permitted to occupy the same raceways, boxes, or cabinets of other circuits that are not part of the life safety branch.

**(E) Receptacle Identification.** The cover plates for the electrical receptacles or the electrical receptacles themselves supplied from the emergency electrical system shall have a distinctive color or marking so as to be readily identifiable. [99:4.5.2.2.4.2]

#### 517.42 Automatic Connection to Life Safety Branch

The life safety branch shall be installed and connected to the alternate source of power so that all functions specified herein shall be automatically restored to operation within 10 seconds after the interruption of the normal source. No functions other than those listed in 517.42(A) through (G) shall be connected to the life safety branch. The life safety branch shall supply power for the following lighting, receptacles, and equipment.

Informational Note: The life safety branch is called the emergency system in NFPA 99-2005, *Standard for Health Care Facilities*.

**(A) Illumination of Means of Egress.** Illumination of means of egress as is necessary for corridors, passageways, stairways, landings, and exit doors and all ways of approach to exits. Switching arrangement to transfer patient corridor lighting from general illumination circuits shall be permitted, providing only one of two circuits can be selected and both circuits cannot be extinguished at the same time.

Informational Note: See NFPA 101-2009, *Life Safety Code*, Sections 7.8 and 7.9.

**(B) Exit Signs.** Exit signs and exit directional signs.

Informational Note: See NFPA 101-2009, *Life Safety Code*, Section 7.10.

**(C) Alarm and Alerting Systems.** Alarm and alerting systems, including the following:

- (1) Fire alarms

Informational Note: See NFPA 101-2009, *Life Safety Code*, Sections 9.6 and 18.3.4.

- (2) Alarms required for systems used for the piping of non-flammable medical gases

Informational Note: See NFPA 99-2005, *Standard for Health Care Facilities*, 4.4.2.2.2(3).

**(D) Communications Systems.** Communications systems, where used for issuing instructions during emergency conditions.

**(E) Dining and Recreation Areas.** Sufficient lighting in dining and recreation areas to provide illumination to exit ways.

**(F) Generator Set Location.** Task illumination and selected receptacles in the generator set location.

**(G) Elevators.** Elevator cab lighting, control, communications, and signal systems. [99:4.4.2.2.2(6), 4.5.2.2.2(7)]

#### 517.43 Connection to Critical Branch

The critical branch shall be installed and connected to the alternate power source so that the equipment listed in 517.43(A) shall be automatically restored to operation at appropriate time-lag intervals following the restoration of the life safety branch to operation. Its arrangement shall also provide for the additional connection of equipment listed in 517.43(B) by either delayed automatic or manual operation. [99:4.5.2.2.3.1]

*Exception: For essential electrical systems under 150 kVA, deletion of the time-lag intervals feature for delayed automatic connection to the equipment system shall be permitted.*

**(A) Delayed Automatic Connection.** The following equipment shall be permitted to be connected to the critical branch and shall be arranged for delayed automatic connection to the alternate power source:

- (1) Patient care areas — task illumination and selected receptacles in the following:
  - a. Medication preparation areas
  - b. Pharmacy dispensing areas
  - c. Nurses' stations (unless adequately lighted by corridor luminaires)
- (2) Sump pumps and other equipment required to operate for the safety of major apparatus and associated control systems and alarms

- (3) Smoke control and stair pressurization systems
- (4) Kitchen hood supply and/or exhaust systems, if required to operate during a fire in or under the hood
- (5) Supply, return, and exhaust ventilating systems for airborne infectious isolation rooms [99:4.5.2.2.3.3(1) through (5)]

**(B) Delayed Automatic or Manual Connection.** The following equipment shall be permitted to be connected to the critical branch and shall be arranged for either delayed automatic or manual connection to the alternate power source:

- (1) Heating equipment to provide heating for patient rooms.

*Exception: Heating of general patient rooms during disruption of the normal source shall not be required under any of the following conditions:*

- (1) *The outside design temperature is higher than  $-6.7^{\circ}\text{C}$  ( $20^{\circ}\text{F}$ ).*
- (2) *The outside design temperature is lower than  $-6.7^{\circ}\text{C}$  ( $20^{\circ}\text{F}$ ) and where a selected room(s) is provided for the needs of all confined patients, only such room(s) need be heated.*
- (3) *The facility is served by a dual source of normal power as described in 517.44(C), Informational Note.*

Informational Note: The outside design temperature is based on the 97 $\frac{1}{2}$  percent design values as shown in Chapter 24 of the ASHRAE *Handbook of Fundamentals* (1997).

- (2) Elevator service — in instances where disruption of power would result in elevators stopping between floors, throw-over facilities shall be provided to allow the temporary operation of any elevator for the release of passengers. For elevator cab lighting, control, and signal system requirements, see 517.42(G).
- (3) Additional illumination, receptacles, and equipment shall be permitted to be connected only to the critical branch.

[99:4.5.2.2.3.4(A), (B), and (C)]

### 517.44 Sources of Power

**(A) Two Independent Sources of Power.** Essential electrical systems shall have a minimum of two independent sources of power: a normal source generally supplying the entire electrical system and one or more alternate sources for use when the normal source is interrupted. [99:4.4.1.1.4]

**(B) Alternate Source of Power.** The alternate source of power shall be a generator(s) driven by some form of prime mover(s) and located on the premises.

*Exception No. 1: Where the normal source consists of generating units on the premises, the alternate source shall be either another generator set or an external utility service.*

*Exception No. 2: Nursing homes or limited care facilities meeting the requirement of 517.40(A) and other health care facilities meeting the requirement of 517.45 shall be permitted to use a battery system or self-contained battery integral with the equipment.*

**(C) Location of Essential Electrical System Components.** Careful consideration shall be given to the location of the spaces housing the components of the essential electrical system to minimize interruptions caused by natural forces common to the area (e.g., storms, floods, earthquakes, or hazards created by adjoining structures or activities). Consideration shall also be given to the possible interruption of normal electrical services resulting from similar causes as well as possible disruption of normal electrical service due to internal wiring and equipment failures.

Informational Note: Facilities in which the normal source of power is supplied by two or more separate central station-fed services experience greater than normal electrical service reliability than those with only a single feed. Such a dual source of normal power consists of two or more electrical services fed from separate generator sets or a utility distribution network that has multiple power input sources and is arranged to provide mechanical and electrical separation so that a fault between the facility and the generating sources will not likely cause an interruption of more than one of the facility service feeders.

### 517.45 Essential Electrical Systems for Other Health Care Facilities

**(A) Essential Electrical Distribution.** The essential electrical distribution system shall be a battery or generator system.

Informational Note: See NFPA 99-2005, *Standard for Health Care Facilities*.

**(B) Electrical Life Support Equipment.** Where electrical life support equipment is required, the essential electrical distribution system shall be as described in 517.30 through 517.35. [99:14.3.4.2.1]

**(C) Critical Care Areas.** Where critical care areas are present, the essential electrical distribution system shall be as described in 517.30 through 517.35. [99:14.3.4.2.2]

**(D) Power Systems.** Battery systems shall be installed in accordance with the requirements of Article 700, and generator systems shall be as described in 517.30 through 517.35.

The requirements of 517.45 and NFPA 99, *Standard for Health Care Facilities*, provide the essential electrical system requirements for health care facilities other than

hospitals, nursing homes, and limited care facilities. These facilities include medical and dental offices and ambulatory health care facilities. Depending on the type and level of patient care, these facilities may require an alternate source of power similar to that provided at a hospital because the level of patient care is essentially the same, even though it is not called or licensed as a hospital.

## IV. Inhalation Anesthetizing Locations

**Informational Note:** For further information regarding safeguards for anesthetizing locations, see NFPA 99-2005, *Standard for Health Care Facilities*.

### 517.60 Anesthetizing Location Classification

**Informational Note:** If either of the anesthetizing locations in 517.60(A) or 517.60(B) is designated a wet procedure location, refer to 517.20.

#### (A) Hazardous (Classified) Location.

**(1) Use Location.** In a location where flammable anesthetics are employed, the entire area shall be considered to be a Class I, Division 1 location that extends upward to a level 1.52 m (5 ft) above the floor. The remaining volume up to the structural ceiling is considered to be above a hazardous (classified) location. [99: Annex E, E.1, and E.2]

**(2) Storage Location.** Any room or location in which flammable anesthetics or volatile flammable disinfecting agents are stored shall be considered to be a Class I, Division 1 location from floor to ceiling.

The extracted requirements for flammable anesthetizing locations are located in Annex E of NFPA 99 rather than throughout that standard as in the past. The reason is explained in the note to Annex E in NFPA 99, which is summarized as follows:

This material is being retained for the following reasons: (1) some countries outside the United States still use this type of anesthetics and rely on the safety measures herein; and (2) while the Committee on Anesthesia Services is unaware of any medical schools in the United States still teaching the proper use of flammable anesthetics or any health care facilities in the United States using flammable anesthetics, retaining this material will serve as a reminder of the precautions that would be necessary should the use of this type of anesthetics be re-instituted.

The NEC has likewise retained the requirements for anesthetizing locations. Section 517.60 designates anesthetizing locations either as hazardous locations, where flammable or nonflammable anesthetics may be interchangeably employed [517.60(A)], or as other-than-hazardous locations,

where only nonflammable anesthetics are used [517.60(B)]. In the case of the flammable anesthetizing location, the volume of the room extending upward from a level 5 ft above the floor to the surface of the structural ceiling, including the space between a drop ceiling and the structural ceiling, is considered to be above a hazardous location.

**(B) Other-Than-Hazardous (Classified) Location.** Any inhalation anesthetizing location designated for the exclusive use of nonflammable anesthetizing agents shall be considered to be an other-than-hazardous (classified) location.

### 517.61 Wiring and Equipment

#### (A) Within Hazardous (Classified) Anesthetizing Locations.

**(1) Isolation.** Except as permitted in 517.160, each power circuit within, or partially within, a flammable anesthetizing location as referred to in 517.60 shall be isolated from any distribution system by the use of an isolated power system. [99: Annex E, E.6.6.2]

**(2) Design and Installation.** Where an isolated power system is utilized, the isolated power equipment shall be listed as isolated power equipment, and the isolated power system shall be designed and installed in accordance with 517.160.

**(3) Equipment Operating at More Than 10 Volts.** In hazardous (classified) locations referred to in 517.60, all fixed wiring and equipment and all portable equipment, including lamps and other utilization equipment, operating at more than 10 volts between conductors shall comply with the requirements of 501.1 through 501.25, and 501.100 through 501.150, and 501.30(A) and 501.30(B) for Class I, Division 1 locations. All such equipment shall be specifically approved for the hazardous atmospheres involved. [99: Annex E, E.2.1, E.4.5, E.4.6, and E.4.7]

**(4) Extent of Location.** Where a box, fitting, or enclosure is partially, but not entirely, within a hazardous (classified) location(s), the hazardous (classified) location(s) shall be considered to be extended to include the entire box, fitting, or enclosure.

**(5) Receptacles and Attachment Plugs.** Receptacles and attachment plugs in a hazardous (classified) location(s) shall be listed for use in Class I, Group C hazardous (classified) locations and shall have provision for the connection of a grounding conductor.

See the commentary following 517.19(B)(2) regarding receptacles listed for hospital use.

**(6) Flexible Cord Type.** Flexible cords used in hazardous (classified) locations for connection to portable utilization equipment, including lamps operating at more than 8 volts between conductors, shall be of a type approved for extra-hard usage in accordance with Table 400.4 and shall include an additional conductor for grounding.

**(7) Flexible Cord Storage.** A storage device for the flexible cord shall be provided and shall not subject the cord to bending at a radius of less than 75 mm (3 in.).

**(B) Above Hazardous (Classified) Anesthetizing Locations.**

**(1) Wiring Methods.** Wiring above a hazardous (classified) location referred to in 517.60 shall be installed in rigid metal conduit, electrical metallic tubing, intermediate metal conduit, Type MI cable, or Type MC cable that employs a continuous, gas/vaportight metal sheath.

**(2) Equipment Enclosure.** Installed equipment that may produce arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, generators, motors, or other equipment having make-and-break or sliding contacts, shall be of the totally enclosed type or be constructed so as to prevent escape of sparks or hot metal particles.

*Exception: Wall-mounted receptacles installed above the hazardous (classified) location in flammable anesthetizing locations shall not be required to be totally enclosed or have openings guarded or screened to prevent dispersion of particles.*

**(3) Luminaires.** Surgical and other luminaires shall conform to 501.130(B).

*Exception No. 1: The surface temperature limitations set forth in 501.130(B)(1) shall not apply.*

*Exception No. 2: Integral or pendant switches that are located above and cannot be lowered into the hazardous (classified) location(s) shall not be required to be explosion-proof.*

**(4) Seals.** Listed seals shall be provided in conformance with 501.15, and 501.15(A)(4) shall apply to horizontal as well as to vertical boundaries of the defined hazardous (classified) locations.

**(5) Receptacles and Attachment Plugs.** Receptacles and attachment plugs located above hazardous (classified) anesthetizing locations shall be listed for hospital use for services of prescribed voltage, frequency, rating, and number of conductors with provision for the connection of the ground-

ing conductor. This requirement shall apply to attachment plugs and receptacles of the 2-pole, 3-wire grounding type for single-phase, 120-volt, nominal, ac service.

**(6) 250-Volt Receptacles and Attachment Plugs Rated 50 and 60 Amperes.** Receptacles and attachment plugs rated 250 volts, for connection of 50-ampere and 60-ampere ac medical equipment for use above hazardous (classified) locations, shall be arranged so that the 60-ampere receptacle will accept either the 50-ampere or the 60-ampere plug. Fifty-ampere receptacles shall be designed so as not to accept the 60-ampere attachment plug. The attachment plugs shall be of the 2-pole, 3-wire design with a third contact connecting to the insulated (green or green with yellow stripe) equipment grounding conductor of the electrical system.

**(C) Other-Than-Hazardous (Classified) Anesthetizing Locations.**

**(1) Wiring Methods.** Wiring serving other-than-hazardous (classified) locations, as defined in 517.60, shall be installed in a metal raceway system or cable assembly. The metal raceway system or cable armor or sheath assembly shall qualify as an equipment grounding conductor in accordance with 250.118. Type MC and Type MI cable shall have an outer metal armor, sheath, or sheath assembly that is identified as an acceptable equipment grounding conductor.

*Exception: Pendant receptacle installations that employ listed Type SJO, or equivalent hard usage or extra-hard usage, flexible cords suspended not less than 1.8 m (6 ft) from the floor shall not be required to be installed in a metal raceway or cable assembly.*

**(2) Receptacles and Attachment Plugs.** Receptacles and attachment plugs installed and used in other-than-hazardous (classified) locations shall be listed “hospital grade” for services of prescribed voltage, frequency, rating, and number of conductors with provision for connection of the grounding conductor. This requirement shall apply to 2-pole, 3-wire grounding type for single-phase, 120-, 208-, or 240-volt, nominal, ac service.

See the commentary following 517.19(B)(2) regarding receptacles listed for hospital use.

**(3) 250-Volt Receptacles and Attachment Plugs Rated 50 Amperes and 60 Amperes.** Receptacles and attachment plugs rated 250 volts, for connection of 50-ampere and 60-ampere ac medical equipment for use in other-than-hazardous (classified) locations, shall be arranged so that the 60-ampere receptacle will accept either the 50-ampere or the 60-ampere plug. Fifty-ampere receptacles shall be designed

so as not to accept the 60-ampere attachment plug. The attachment plugs shall be of the 2-pole, 3-wire design with a third contact connecting to the insulated (green or green with yellow stripe) equipment grounding conductor of the electrical system.

### 517.62 Grounding

In any anesthetizing area, all metal raceways and metal-sheathed cables and all normally non-current-carrying conductive portions of fixed electrical equipment shall be connected to an equipment grounding conductor. Grounding and bonding in Class I locations shall comply with 501.30.

*Exception: Equipment operating at not more than 10 volts between conductors shall not be required to be connected to an equipment grounding conductor.*

The grounding requirements for anesthetizing locations apply only to metal raceways, metal-sheathed cables, and electrical equipment. Carts, tables, and other nonelectrical items are not required to be grounded. In flammable anesthetizing locations, however, portable carts and tables with conductive tires and wheels and conductive flooring are usually employed to avoid the buildup of static electrical charges. See NFPA 99, *Standard for Health Care Facilities*, Annex E, E.6.6.8, for electrostatic safeguards.

### 517.63 Grounded Power Systems in Anesthetizing Locations

**(A) Battery-Powered Lighting Units.** One or more battery-powered lighting units shall be provided and shall be permitted to be wired to the critical lighting circuit in the area and connected ahead of any local switches.

Failure of the emergency circuit feeder that supplies the operating room will ordinarily plunge the room into darkness. Unless some form of uninterruptible power supply is installed, a delay in the restoration of illumination may occur during the time it takes the alternate source of the essential electrical system to come on-line. Even though this delay is limited to 10 seconds (per 517.31), loss of illumination at a critical point in a surgical procedure could result in danger to the patient and in some instances to operating room personnel. To safeguard against being thrust into complete darkness upon interruption of normal power, at least one battery-operated emergency lighting unit is required to be installed. This type of unit equipment provides immediate illumination upon loss of power, helping to mitigate the impact of sudden interruption of the normal illumination. It is permitted to connect the lighting unit to the critical branch circuit.

**(B) Branch-Circuit Wiring.** Branch circuits supplying only listed, fixed, therapeutic and diagnostic equipment, permanently installed above the hazardous (classified) location and in other-than-hazardous (classified) locations, shall be permitted to be supplied from a normal grounded service, single- or three-phase system, provided the following apply:

- (1) Wiring for grounded and isolated circuits does not occupy the same raceway or cable.
- (2) All conductive surfaces of the equipment are connected to an equipment grounding conductor.
- (3) Equipment (except enclosed X-ray tubes and the leads to the tubes) is located at least 2.5 m (8 ft) above the floor or outside the anesthetizing location.
- (4) Switches for the grounded branch circuit are located outside the hazardous (classified) location.

*Exception: Sections 517.63(B)(3) and (B)(4) shall not apply in other-than-hazardous (classified) locations.*

**(C) Fixed Lighting Branch Circuits.** Branch circuits supplying only fixed lighting shall be permitted to be supplied by a normal grounded service, provided the following apply:

- (1) Such luminaires are located at least 2.5 m (8 ft) above the floor.
- (2) All conductive surfaces of luminaires are connected to an equipment grounding conductor.
- (3) Wiring for circuits supplying power to luminaires does not occupy the same raceway or cable for circuits supplying isolated power.
- (4) Switches are wall-mounted and located above hazardous (classified) locations.

*Exception: Sections 517.63(C)(1) and (C)(4) shall not apply in other-than-hazardous (classified) locations.*

**(D) Remote-Control Stations.** Wall-mounted remote-control stations for remote-control switches operating at 24 volts or less shall be permitted to be installed in any anesthetizing location.

**(E) Location of Isolated Power Systems.** Where an isolated power system is utilized, the isolated power equipment shall be listed as isolated power equipment. Isolated power system equipment and its supply circuit shall be permitted to be located in an anesthetizing location, provided it is installed above a hazardous (classified) location or in an other-than-hazardous (classified) location.

**(F) Circuits in Anesthetizing Locations.** Except as permitted above, each power circuit within, or partially within, a flammable anesthetizing location as referred to in 517.60 shall be isolated from any distribution system supplying other-than-anesthetizing locations.

### 517.64 Low-Voltage Equipment and Instruments

**(A) Equipment Requirements.** Low-voltage equipment that is frequently in contact with the bodies of persons or has exposed current-carrying elements shall comply with one of the following:

- (1) Operate on an electrical potential of 10 volts or less
- (2) Be approved as intrinsically safe or double-insulated equipment
- (3) Be moisture resistant

**(B) Power Supplies.** Power shall be supplied to low-voltage equipment from one of the following:

- (1) An individual portable isolating transformer (autotransformers shall not be used) connected to an isolated power circuit receptacle by means of an appropriate cord and attachment plug
- (2) A common low-voltage isolating transformer installed in an other-than-hazardous (classified) location
- (3) Individual dry-cell batteries
- (4) Common batteries made up of storage cells located in an other-than-hazardous (classified) location

**(C) Isolated Circuits.** Isolating-type transformers for supplying low-voltage circuits shall have both of the following:

- (1) Approved means for insulating the secondary circuit from the primary circuit
- (2) The core and case connected to an equipment grounding conductor

**(D) Controls.** Resistance or impedance devices shall be permitted to control low-voltage equipment but shall not be used to limit the maximum available voltage to the equipment.

**(E) Battery-Powered Appliances.** Battery-powered appliances shall not be capable of being charged while in operation unless their charging circuitry incorporates an integral isolating-type transformer.

**(F) Receptacles or Attachment Plugs.** Any receptacle or attachment plug used on low-voltage circuits shall be of a type that does not permit interchangeable connection with circuits of higher voltage.

Informational Note: Any interruption of the circuit, even circuits as low as 10 volts, either by any switch or loose or defective connections anywhere in the circuit, may produce a spark that is sufficient to ignite flammable anesthetic agents.

## V. X-Ray Installations

Nothing in this part shall be construed as specifying safeguards against the useful beam or stray X-ray radiation.

Informational Note No. 1: Radiation safety and performance requirements of several classes of X-ray equipment are regulated under Public Law 90-602 and are enforced by the Department of Health and Human Services.

Informational Note No. 2: In addition, information on radiation protection by the National Council on Radiation Protection and Measurements is published as *Reports of the National Council on Radiation Protection and Measurement*. These reports are obtainable from NCRP Publications, P.O. Box 30175, Washington, DC 20014.

### 517.71 Connection to Supply Circuit

**(A) Fixed and Stationary Equipment.** Fixed and stationary X-ray equipment shall be connected to the power supply by means of a wiring method complying with applicable requirements of Chapters 1 through 4 of this *Code*, as modified by this article.

*Exception: Equipment properly supplied by a branch circuit rated at not over 30 amperes shall be permitted to be supplied through a suitable attachment plug and hard-service cable or cord.*

**(B) Portable, Mobile, and Transportable Equipment.** Individual branch circuits shall not be required for portable, mobile, and transportable medical X-ray equipment requiring a capacity of not over 60 amperes.

**(C) Over 600-Volt Supply.** Circuits and equipment operated on a supply circuit of over 600 volts shall comply with Article 490.

### 517.72 Disconnecting Means

**(A) Capacity.** A disconnecting means of adequate capacity for at least 50 percent of the input required for the momentary rating or 100 percent of the input required for the long-time rating of the X-ray equipment, whichever is greater, shall be provided in the supply circuit.

**(B) Location.** The disconnecting means shall be operable from a location readily accessible from the X-ray control.

**(C) Portable Equipment.** For equipment connected to a 120-volt branch circuit of 30 amperes or less, a grounding-type attachment plug and receptacle of proper rating shall be permitted to serve as a disconnecting means.

### 517.73 Rating of Supply Conductors and Overcurrent Protection

**(A) Diagnostic Equipment.**

**(1) Branch Circuits.** The ampacity of supply branch-circuit conductors and the current rating of overcurrent protective devices shall not be less than 50 percent of the momentary rating or 100 percent of the long-time rating, whichever is greater.

**(2) Feeders.** The ampacity of supply feeders and the current rating of overcurrent protective devices supplying two or more branch circuits supplying X-ray units shall not be less than 50 percent of the momentary demand rating of the largest unit plus 25 percent of the momentary demand rating of the next largest unit plus 10 percent of the momentary demand rating of each additional unit. Where simultaneous biplane examinations are undertaken with the X-ray units, the supply conductors and overcurrent protective devices shall be 100 percent of the momentary demand rating of each X-ray unit.

Informational Note: The minimum conductor size for branch and feeder circuits is also governed by voltage regulation requirements. For a specific installation, the manufacturer usually specifies minimum distribution transformer and conductor sizes, rating of disconnecting means, and overcurrent protection.

**(B) Therapeutic Equipment.** The ampacity of conductors and rating of overcurrent protective devices shall not be less than 100 percent of the current rating of medical X-ray therapy equipment.

Informational Note: The ampacity of the branch-circuit conductors and the ratings of disconnecting means and overcurrent protection for X-ray equipment are usually designated by the manufacturer for the specific installation.

#### 517.74 Control Circuit Conductors

**(A) Number of Conductors in Raceway.** The number of control circuit conductors installed in a raceway shall be determined in accordance with 300.17.

**(B) Minimum Size of Conductors.** Size 18 AWG or 16 AWG fixture wires as specified in 725.49 and flexible cords shall be permitted for the control and operating circuits of X-ray and auxiliary equipment where protected by not larger than 20-ampere overcurrent devices.

#### 517.75 Equipment Installations

All equipment for new X-ray installations and all used or reconditioned X-ray equipment moved to and reinstalled at a new location shall be of an approved type.

#### 517.76 Transformers and Capacitors

Transformers and capacitors that are part of X-ray equipment shall not be required to comply with Articles 450 and 460.

Capacitors shall be mounted within enclosures of insulating material or grounded metal.

#### 517.77 Installation of High-Tension X-Ray Cables

Cables with grounded shields connecting X-ray tubes and image intensifiers shall be permitted to be installed in cable

trays or cable troughs along with X-ray equipment control and power supply conductors without the need for barriers to separate the wiring.

#### 517.78 Guarding and Grounding

**(A) High-Voltage Parts.** All high-voltage parts, including X-ray tubes, shall be mounted within grounded enclosures. Air, oil, gas, or other suitable insulating media shall be used to insulate the high-voltage from the grounded enclosure. The connection from the high-voltage equipment to X-ray tubes and other high-voltage components shall be made with high-voltage shielded cables.

**(B) Low-Voltage Cables.** Low-voltage cables connecting to oil-filled units that are not completely sealed, such as transformers, condensers, oil coolers, and high-voltage switches, shall have insulation of the oil-resistant type.

**(C) Non-Current-Carrying Metal Parts.** Non-current-carrying metal parts of X-ray and associated equipment (controls, tables, X-ray tube supports, transformer tanks, shielded cables, X-ray tube heads, etc.) shall be connected to an equipment grounding conductor in the manner specified in Part VII of Article 250, as modified by 517.13(A) and (B).

### VI. Communications, Signaling Systems, Data Systems, Fire Alarm Systems, and Systems Less Than 120 Volts, Nominal

#### 517.80 Patient Care Areas

Equivalent insulation and isolation to that required for the electrical distribution systems in patient care areas shall be provided for communications, signaling systems, data system circuits, fire alarm systems, and systems less than 120 volts, nominal.

Class 2 and Class 3 signaling and communications systems and power-limited fire alarm systems shall not be required to comply with the grounding requirements of 517.13, to comply with the mechanical protection requirements of 517.30(C)(3)(5), or to be enclosed in raceways, unless otherwise specified by Chapter 7 or 8.

Secondary circuits of transformer-powered communications or signaling systems shall not be required to be enclosed in raceways unless otherwise specified by Chapter 7 or 8. [99:4.4.2.2.4.6]

One of the major objectives of the requirements in Article 517 is to minimize patients' exposure to any level of current that could compromise their well being. The requirement in 517.80 extends the overall performance requirement of 517.11 to the limited energy circuits and equipment covered

in Articles 725, 760, 800, 820, 830, and 840. This section requires the use of insulation and/or isolation methods for these circuits and associated equipment that will afford the same level of protection against hazardous levels of current as that required for the power distribution system. See the informational note to 517.11. Nurse call, intercom, speaker, cable television, and fire alarm systems are examples of the types of circuits covered by this requirement.

Some classes of limited energy circuits, including Class 2 and Class 3 remote control and signaling circuits as well as power-limited fire alarm circuits that are installed in patient care areas, are not required to comply with the same grounding or mechanical protection provisions as are required for power and lighting circuits. This does not remove applicable installation requirements, such as the use of a raceway, if specified in Chapter 7 or Chapter 8 and the fundamental requirement of this section to provide safeguards against any shock or leakage current hazards that may exist with these circuits and associated equipment.

### 517.81 Other-Than-Patient-Care Areas

In other-than-patient-care areas, installations shall be in accordance with the applicable provisions of other parts of this Code.

### 517.82 Signal Transmission Between Appliances

**(A) General.** Permanently installed signal cabling from an appliance in a patient location to remote appliances shall employ a signal transmission system that prevents hazardous grounding interconnection of the appliances.

Informational Note: See 517.13(A) for additional grounding requirements in patient care areas.

**(B) Common Signal Grounding Wire.** Common signal grounding wires (i.e., the chassis ground for single-ended transmission) shall be permitted to be used between appliances all located within the patient care vicinity, provided the appliances are served from the same reference grounding point.

## VII. Isolated Power Systems

### 517.160 Isolated Power Systems

#### (A) Installations.

**(1) Isolated Power Circuits.** Each isolated power circuit shall be controlled by a switch or circuit breaker that has a disconnecting pole in each isolated circuit conductor to simultaneously disconnect all power. Such isolation shall be accomplished by means of one or more isolation transformers, by means of generator sets, or by means of electrically isolated batteries. Conductors of isolated power circuits

shall not be installed in cables, raceways, or other enclosures containing conductors of another system.

**(2) Circuit Characteristics.** Circuits supplying primaries of isolating transformers shall operate at not more than 600 volts between conductors and shall be provided with proper overcurrent protection. The secondary voltage of such transformers shall not exceed 600 volts between conductors of each circuit. All circuits supplied from such secondaries shall be ungrounded and shall have an approved overcurrent device of proper ratings in each conductor. Circuits supplied directly from batteries or from motor generator sets shall be ungrounded and shall be protected against overcurrent in the same manner as transformer-fed secondary circuits. If an electrostatic shield is present, it shall be connected to the reference grounding point. [99:4.3.2.6.1]

**(3) Equipment Location.** The isolating transformers, motor generator sets, batteries and battery chargers, and associated primary or secondary overcurrent devices shall not be installed in hazardous (classified) locations. The isolated secondary circuit wiring extending into a hazardous anesthetizing location shall be installed in accordance with 501.10.

**(4) Isolation Transformers.** An isolation transformer shall not serve more than one operating room except as covered in (A)(4)(a) and (A)(4)(b).

For purposes of this section, anesthetic induction rooms are considered part of the operating room or rooms served by the induction rooms.

**(a) Induction Rooms.** Where an induction room serves more than one operating room, the isolated circuits of the induction room shall be permitted to be supplied from the isolation transformer of any one of the operating rooms served by that induction room.

**(b) Higher Voltages.** Isolation transformers shall be permitted to serve single receptacles in several patient areas where the following apply:

- (1) The receptacles are reserved for supplying power to equipment requiring 150 volts or higher, such as portable X-ray units.
- (2) The receptacles and mating plugs are not interchangeable with the receptacles on the local isolated power system.

[99:13.4.1.2.6.6]

**(5) Conductor Identification.** The isolated circuit conductors shall be identified as follows:

- (1) Isolated Conductor No. 1 — Orange with at least one distinctive colored stripe other than white, green, or gray along the entire length of the conductor

- (2) Isolated Conductor No. 2 — Brown with at least one distinctive colored stripe other than white, green, or gray along the entire length of the conductor

For 3-phase systems, the third conductor shall be identified as yellow with at least one distinctive colored stripe other than white, green, or gray along the entire length of the conductor. Where isolated circuit conductors supply 125-volt, single-phase, 15- and 20-ampere receptacles, the striped orange conductor(s) shall be connected to the terminal(s) on the receptacles that are identified in accordance with 200.10(B) for connection to the grounded circuit conductor.

**(6) Wire-Pulling Compounds.** Wire-pulling compounds that increase the dielectric constant shall not be used on the secondary conductors of the isolated power supply.

Informational Note No. 1: It is desirable to limit the size of the isolation transformer to 10 kVA or less and to use conductor insulation with low leakage to meet impedance requirements.

Informational Note No. 2: Minimizing the length of branch-circuit conductors and using conductor insulations with a dielectric constant less than 3.5 and insulation resistance constant greater than 6100 megohm-meters (20,000 megohm-feet) at 16°C (60°F) reduces leakage from line to ground, reducing the hazard current.

See Exhibit 517.7 for an example of a hospital isolated power system panel.

**EXHIBIT 517.7** An example of a hospital isolated power system panel with built-in isolation transformer, line isolation monitor, load center, and grounded busbar. (Courtesy of Schneider Electric)

## **(B) Line Isolation Monitor.**

**(1) Characteristics.** In addition to the usual control and overcurrent protective devices, each isolated power system shall be provided with a continually operating line isolation monitor that indicates total hazard current. The monitor shall be designed such that a green signal lamp, conspicuously visible to persons in each area served by the isolated power system, remains lighted when the system is adequately isolated from ground. An adjacent red signal lamp and an audible warning signal (remote if desired) shall be energized when the total hazard current (consisting of possible resistive and capacitive leakage currents) from either isolated conductor to ground reaches a threshold value of 5 mA under nominal line voltage conditions. The line monitor shall not alarm for a fault hazard of less than 3.7 mA or for a total hazard current of less than 5 mA.

*Exception: A system shall be permitted to be designed to operate at a lower threshold value of total hazard current. A line isolation monitor for such a system shall be permitted to be approved, with the provision that the fault hazard current shall be permitted to be reduced but not to less than 35 percent of the corresponding threshold value of the total hazard current, and the monitor hazard current is to be correspondingly reduced to not more than 50 percent of the alarm threshold value of the total hazard current.*

**(2) Impedance.** The line isolation monitor shall be designed to have sufficient internal impedance such that, when properly connected to the isolated system, the maximum internal current that can flow through the line isolation monitor, when any point of the isolated system is grounded, shall be 1 mA.

*Exception: The line isolation monitor shall be permitted to be of the low-impedance type such that the current through the line isolation monitor, when any point of the isolated system is grounded, will not exceed twice the alarm threshold value for a period not exceeding 5 milliseconds.*

Informational Note: Reduction of the monitor hazard current, provided this reduction results in an increased “not alarm” threshold value for the fault hazard current, will increase circuit capacity.

**(3) Ammeter.** An ammeter calibrated in the total hazard current of the system (contribution of the fault hazard current plus monitor hazard current) shall be mounted in a plainly visible place on the line isolation monitor with the “alarm on” zone at approximately the center of the scale.

*Exception: The line isolation monitor shall be permitted to be a composite unit, with a sensing section cabled to a sepa-*

rate display panel section on which the alarm or test functions are located.

Informational Note: It is desirable to locate the ammeter so that it is conspicuously visible to persons in the anesthetizing location.

## ARTICLE 518 Assembly Occupancies

### 518.1 Scope

Except for the assembly occupancies explicitly covered by 520.1, this article covers all buildings or portions of buildings or structures designed or intended for the gathering together of 100 or more persons for such purposes as deliberation, worship, entertainment, eating, drinking, amusement, awaiting transportation, or similar purposes.

Article 518 applies to assembly occupancies designed or intended for 100 or more persons with the population capacity determined by methods utilized in NFPA 101, *Life Safety Code*. Article 518 would apply, for example, to a church chapel or auditorium for occupancy of 100 or more persons but not to a supermarket. Even though a supermarket may contain 100 or more persons, it is not specifically designed or intended for the assembly of persons. Article 518 does not apply to office buildings or schools, even though such buildings, as a rule, are designed for occupancy by 100 or more persons. It does, however, apply to assembly halls, restaurants, and so on, within an office or school building if these parts of the building are designed or intended for the assembly of 100 or more persons.

The following information for determining new assembly occupancy capacity is extracted from NFPA 101-2009, *Life Safety Code*:

### 12.1.7 Occupant Load.

**12.1.7.1 General.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors of Table 7.3.1.2 [Commentary Table 518.1] that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

⋮

### 7.3.1 Occupant Load.

#### 7.3.1.1 Sufficient Capacity.

**7.3.1.1.1** The total capacity of the means of egress for any story, balcony, tier, or other occupied space shall be sufficient for the occupant load thereof.

**7.3.1.1.2** For other than existing means of egress, where more than one means of egress is required, the means of egress shall be of such width and capacity that the loss of any one means of egress leaves available not less than 50 percent of the required capacity.

**7.3.1.2 Occupant Load Factor.** The occupant load in any building or portion thereof shall be not less than the number of persons determined by dividing the floor area assigned to that use by the occupant load factor for that use as specified in Table 7.3.1.2 [Commentary Table 518.1]. Where both gross and net area figures are given for the same occupancy, calculations shall be made by applying the gross area figure to the gross area of the portion of the building devoted to the use for which the gross area figure is specified and by applying the net area figure to the net area of the portion of the building devoted to the use for which the net area figure is specified.

### 518.2 General Classification

**(A) Examples.** Assembly occupancies shall include, but not be limited to, the following:

Armories	Exhibition halls
Assembly halls	Gymnasiums
Auditoriums	Mortuary chapels
Bowling lanes	Multipurpose rooms
Club rooms	Museums
Conference rooms	Places of awaiting transportation
Courtrooms	Places of religious worship
Dance halls	Pool rooms
Dining and drinking facilities	Restaurants
	Skating rinks

**(B) Multiple Occupancies.** Where an assembly occupancy forms a portion of a building containing other occupancies, Article 518 applies only to that portion of the

**COMMENTARY TABLE 518.1** Occupant Load Factor

Use	m <sup>2</sup> (per person) <sup>1</sup>	ft <sup>2</sup> (per person) <sup>1</sup>
<b>Assembly Use</b>		
Concentrated use, without fixed seating	0.65 net	7 net
Less concentrated use, without fixed seating	1.4 net	15 net

<b>Storage Use</b>		
In storage occupancies	NA	NA
In mercantile occupancies	27.9	300
In other than storage and mercantile occupancies	46.5	500

COMMENTARY TABLE 518.1 *Continued*

Use	m <sup>2</sup> (per person) <sup>1</sup>	ft <sup>2</sup> (per person) <sup>1</sup>
<b>Mercantile Use</b>		
Sales area on street floor <sup>2,3</sup>	2.8	30
Sales area on two or more street floors <sup>3</sup>	3.7	40
Sales area on floor below street floor <sup>3</sup>	2.8	30
Sales area on floors above street floor <sup>3</sup>	5.6	60
Floors or portions of floors used only for offices	See business use	See business use
Floors or portions of floors used only for storage, receiving, and shipping, and not open to general public	27.9	300
Mall buildings <sup>4</sup>	Per factors applicable to use of space <sup>5</sup>	Per factors applicable to use of space <sup>5</sup>

Note: NA = not applicable. The occupant load is the maximum probable number of occupants present at any time.

<sup>1</sup>All factors are expressed in gross area unless marked “net.”

<sup>2</sup>For the purpose of determining occupant load in mercantile occupancies where, due to differences in grade of streets on different sides, two or more floors directly accessible from streets (not including alleys or similar back streets) exist, each such floor is permitted to be considered a street floor. The occupant load factor is one person for each 3.7 m<sup>2</sup> (40 ft<sup>2</sup>) of gross floor area of sales space.

<sup>3</sup>For the purpose of determining occupant load in mercantile occupancies with no street floor, as defined in 3.3.216 [of NFPA 101], but with access directly from the street by stairs or escalators, the floor at the point of entrance to the mercantile occupancy is considered the street floor.

<sup>4</sup>For any food court or other assembly use areas located in the mall that are not included as a portion of the gross leasable area of the mall building, the occupant load is calculated based on the occupant load factor for that use as specified in Table 7.3.1.2 [of NFPA 101]. The remaining mall area is not required to be assigned an occupant load.

<sup>5</sup>The portions of the mall that are considered a pedestrian way and not used as gross leasable area are not required to be assessed an occupant load based on Table 7.3.1.2 [of NFPA 101]. However, means of egress from a mall pedestrian way are required to be provided for an occupant load determined by dividing the gross leasable area of the mall building (not including anchor stores) by the appropriate lowest whole number occupant load factor from Figure 7.3.1.2(a) or Figure 7.3.1.2(b) [of NFPA 101].

Each individual tenant space is required to have means of egress to the outside or to the mall based on occupant loads calculated by using the appropriate occupant load factor from Table 7.3.1.2 [of NFPA 101].

Each individual anchor store is required to have means of egress independent of the mall.

building considered an assembly occupancy. Occupancy of any room or space for assembly purposes by less than 100 persons in a building of other occupancy, and incidental to such other occupancy, shall be classified as part of the other occupancy and subject to the provisions applicable thereto.

**(C) Theatrical Areas.** Where any such building structure, or portion thereof, contains a projection booth or stage platform or area for the presentation of theatrical or musical productions, either fixed or portable, the wiring for that area, including associated audience seating areas, and all equipment that is used in the referenced area, and portable equipment and wiring for use in the production that will not be connected to permanently installed wiring, shall comply with Article 520.

The requirements in Article 520 apply to theatrical areas in assembly occupancies. See the commentary following 520.1.

Informational Note: For methods of determining population capacity, see local building code or, in its absence, NFPA 101-2009, *Life Safety Code*.

### 518.3 Other Articles

**(A) Hazardous (Classified) Areas.** Electrical installations in hazardous (classified) areas located in assembly occupancies shall comply with Article 500.

**(B) Temporary Wiring.** In exhibition halls used for display booths, as in trade shows, the temporary wiring shall be per-

mitted to be installed in accordance with Article 590. Flexible cables and cords approved for hard or extra-hard usage shall be permitted to be laid on floors where protected from contact by the general public. The ground-fault circuit-interrupter requirements of 590.6 shall not apply. All other ground-fault circuit-interrupter requirements of this *Code* shall apply.

Where ground-fault circuit interrupter protection for personnel is supplied by plug-and-cord-connection to the branch circuit or to the feeder, the ground fault circuit interrupter protection shall be listed as portable ground fault circuit interrupter protection or provide a level of protection equivalent to a portable ground fault circuit interrupter, whether assembled in the field or at the factory.

Temporary installations in exhibition halls must meet all other applicable GFCI protection requirements in addition to the requirements in 518.3(B). Although trade show booths are connected to temporary wiring, GFCI protection is required for installations of water features at garden shows and for receptacles near sinks for food vendors for example.

Permanent GFCI protection differs from portable GFCI protection. Product standards that address GFCI equipment require portable devices to de-energize the contacts when the grounded conductor is open, a grounded and grounded conductor is transposed (miswired), and/or an ungrounded conductor is open. For this reason, GFCI protection for temporary wiring must be listed as portable or provide equivalent protection to a portable GFCI device.

A treadle, such as the one shown in Exhibit 518.1, is an example of a protection technique used to protect temporary cords from abuse in areas where the cords must be laid across pedestrian ways, such as in exhibition halls.

**EXHIBIT 518.1** A treadle used to protect temporary cords. (Courtesy of Woodhead Industries, a division of Molex)

*Exception: Where conditions of supervision and maintenance ensure that only qualified persons will service the installation, flexible cords or cables identified in Table 400.4*

*for hard usage or extra-hard usage shall be permitted in cable trays used only for temporary wiring. All cords or cables shall be installed in a single layer. A permanent sign shall be attached to the cable tray at intervals not to exceed 7.5 m (25 ft). The sign shall read*

#### **CABLE TRAY FOR TEMPORARY WIRING ONLY**

**(C) Emergency Systems.** Control of emergency systems shall comply with Article 700.

### **518.4 Wiring Methods**

**(A) General.** The fixed wiring methods shall be metal raceways, flexible metal raceways, nonmetallic raceways encased in not less than 50 mm (2 in.) of concrete, Type MI, MC, or AC cable. The wiring method shall itself qualify as an equipment grounding conductor according to 250.118 or shall contain an insulated equipment grounding conductor sized in accordance with Table 250.122.

*Exception: Fixed wiring methods shall be as provided in*

- (a) *Audio signal processing, amplification, and reproduction equipment — Article 640*
- (b) *Communications circuits — Article 800*
- (c) *Class 2 and Class 3 remote-control and signaling circuits — Article 725*
- (d) *Fire alarm circuits — Article 760*

**(B) Nonrated Construction.** In addition to the wiring methods of 518.4(A), nonmetallic-sheathed cable, Type AC cable, electrical nonmetallic tubing, and rigid nonmetallic conduit shall be permitted to be installed in those buildings or portions thereof that are not required to be of fire-rated construction by the applicable building code.

*Informational Note: Fire-rated construction is the fire-resistive classification used in building codes.*

**(C) Spaces with Finish Rating.** Electrical nonmetallic tubing and rigid nonmetallic conduit shall be permitted to be installed in club rooms, conference and meeting rooms in hotels or motels, courtrooms, dining facilities, restaurants, mortuary chapels, museums, libraries, and places of religious worship where the following apply:

- (1) The electrical nonmetallic tubing or rigid nonmetallic conduit is installed concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.
- (2) The electrical nonmetallic tubing or rigid nonmetallic conduit is installed above suspended ceilings where the suspended ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.

Electrical nonmetallic tubing and rigid nonmetallic conduit are not recognized for use in other space used for environmental air in accordance with 300.22(C).

**Informational Note:** A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud or wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature rise of 163°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.

The wiring methods identified in 518.4(A) and its exception apply to any wall, floor, or ceiling within an assembly occupancy, as classified in 518.2. The requirements of 518.4(B) apply to those portions of the building and those assembly occupancies not required to be fire rated. The permission to use electrical nonmetallic tubing and rigid nonmetallic conduit as specified in 518.4(C) applies only to the specific occupancies described, provided these wiring methods are installed concealed behind a surface that has a 15-minute finish rating.

Exhibit 518.2 illustrates a single-story facility in which the wash rooms and office area are not assembly occupancies, as defined in 518.2, and therefore require no special wiring

**EXHIBIT 518.2** Floor plan of a single-story facility. The walls (represented by wide yellow lines) are required by the local building code to be of fire-rated construction; the thin black lines represent walls not required by the local building code to be of fire-rated construction.

methods. Ordinary wiring methods may be used on the inside surface of the storage area walls and on or in the partitions between storage areas, because those areas are not assembly occupancies. Inside any hollow spaces of the fire-rated storage area walls, however, the main requirements of 518.4 apply, because the serving corridors are part of the assembly occupancies as a result of this particular building design. If the hollow spaces of fire-rated walls or ceiling also provide a 15-minute finish rating and are not other spaces for environmental air, as described in 300.22(C), electrical nonmetallic tubing as well as rigid nonmetallic conduit is permitted for specifically described occupancies. (See 362.10.) In like manner, wiring in ceilings or floors that is required to be of fire-rated construction in the assembly occupancy must also comply with 518.4, except as noted in 518.4(A), Exception.

Assembly occupancies frequently require emergency wiring, particularly for emergency illumination and exit lighting. The requirements of 700.10(D) contain special fire protection requirements for emergency circuits in assembly occupancies with an occupant capacity of 1000 or more.

## 518.5 Supply

Portable switchboards and portable power distribution equipment shall be supplied only from listed power outlets of sufficient voltage and ampere rating. Such power outlets shall be protected by overcurrent devices. Such overcurrent devices and power outlets shall not be accessible to the general public. Provisions for connection of an equipment grounding conductor shall be provided. The neutral conductor of feeders supplying solid-state phase control, 3-phase, 4-wire dimmer systems shall be considered a current-carrying conductor for purposes of ampacity adjustment. The neutral conductor of feeders supplying solid-state sine wave, 3-phase, 4-wire dimming systems shall not be considered a current-carrying conductor for purposes of ampacity adjustment.

**Exception:** The neutral conductor of feeders supplying systems that use or may use both phase-control and sine-wave dimmers shall be considered as current-carrying for purposes of ampacity adjustment.

**Informational Note:** For definitions of solid-state dimmer types, see 520.2.

Portable switchboards and portable power distribution equipment must be supplied only from listed power outlets, such as the one shown in Exhibit 518.3, that are rated for the voltage and current for which they are used. The power outlets and their overcurrent devices must be located so as not to be accessible to the general public.

Some professional performance lighting systems now use solid-state, sine wave, 3-phase, 4-wire dimming systems.

**EXHIBIT 518.3** A listed power outlet for connection of portable switchboards in an assembly occupancy. (Courtesy of Union Connector Co., Inc.)

These dimmers vary with the amplitude of the applied voltage wave-form without any of the nonlinear switching found in phase-control solid-state dimmers. Because solid-state sine wave dimmers are linear loads, they do not require the neutral to be considered as a current-carrying conductor.

## I. General

### 520.1 Scope

This article covers all buildings or that part of a building or structure, indoor or outdoor, designed or used for presentation, dramatic, musical, motion picture projection, or similar purposes and to specific audience seating areas within motion picture or television studios.

The special requirements of Article 520 apply only to that part of a building used as a theater or for a similar purpose and do not necessarily apply to the entire building. In a school building, for example, the requirements of Article 520 apply to an auditorium used for dramatic or other performances. The special requirements of this article apply to the stage, auditorium, dressing rooms, and main corridors leading to the auditorium, but not to other parts of the building that are not involved in the use of the auditorium for performances or entertainment. The theater space may be a traditional theater, where the audience sits in the auditorium (house) facing the proscenium arch and views the performance on the stage on the other side of the arch, or it may house other spaces, such as a simple stage platform, either indoors or outdoors, with seats on three or four sides facing the platform. Audience areas of motion picture and television studios, as defined and covered in Article 530, are also covered by the requirements of Article 520.

### 520.2 Definitions

**Border Light.** A permanently installed overhead strip light.

**Breakout Assembly.** An adapter used to connect a multipole connector containing two or more branch circuits to multiple individual branch-circuit connectors.

**Bundled.** Cables or conductors that are tied, wrapped, taped, or otherwise periodically bound together.

**Connector Strip.** A metal wireway containing pendant or flush receptacles.

**Drop Box.** A box containing pendant- or flush-mounted receptacles attached to a multiconductor cable via strain relief or a multipole connector.

**Footlight.** A border light installed on or in the stage.

**Grouped.** Cables or conductors positioned adjacent to one another but not in continuous contact with each other.

**Performance Area.** The stage and audience seating area associated with a temporary stage structure, whether indoors or outdoors, constructed of scaffolding, truss, platforms, or similar devices, that is used for the presentation of theatrical or musical productions or for public presentations.

**Portable Equipment.** Equipment fed with portable cords or cables intended to be moved from one place to another.

**Portable Power Distribution Unit.** A power distribution box containing receptacles and overcurrent devices.

**Proscenium.** The wall and arch that separates the stage from the auditorium (house).

**Solid-State Phase-Control Dimmer.** A solid-state dimmer where the wave shape of the steady-state current does not follow the wave shape of the applied voltage, such that the wave shape is nonlinear.

Solid-state phase-control dimmers are nonlinear devices. Where they are used, nonlinear loading of the neutral conductor occurs, which may necessitate increasing the size of the neutral conductor.

**Solid-State Sine Wave Dimmer.** A solid-state dimmer where the wave shape of the steady-state current follows the wave shape of the applied voltage such that the wave shape is linear.

This class of dimmer is used by some professional performance lighting systems. They are solid-state, 3-phase, 4-wire dimming systems whose wave shape varies with the amplitude of the applied voltage wave-form without any of the nonlinear switching found in phase-control solid-state dimmers. Because solid-state sine wave dimmers are linear loads, they do not require the neutral to be considered as a current-carrying conductor. See Exhibit 520.1.

**Stand Lamp (Work Light).** A portable stand that contains a general-purpose luminaire or lampholder with guard for the purpose of providing general illumination on the stage or in the auditorium.

**Strip Light.** A luminaire with multiple lamps arranged in a row.

**Two-Fer.** An adapter cable containing one male plug and two female cord connectors used to connect two loads to one branch circuit.

A two-fer, as shown in Exhibit 520.2, consists of two cord connectors on separate cords connected to a single supply cord.

### 520.3 Motion Picture Projectors

Motion picture equipment and its installation and use shall comply with Article 540.

**EXHIBIT 520.1** Sine wave dimmer racks of 24 and 48 dimmers (2.4 kW). (Courtesy of Electronic Theatre Controls, Inc.)

**EXHIBIT 520.2** A two-fer.

### 520.4 Audio Signal Processing, Amplification, and Reproduction Equipment

Audio signal processing, amplification, and reproduction equipment and its installation shall comply with Article 640.

### 520.5 Wiring Methods

**(A) General.** The fixed wiring method shall be metal raceways, nonmetallic raceways encased in at least 50 mm (2 in.) of concrete, Type MI cable, MC cable, or AC cable containing an insulated equipment grounding conductor sized in accordance with Table 250.122.

*Exception: Fixed wiring methods shall be as provided in Article 640 for audio signal processing, amplification, and reproduction equipment, in Article 800 for communications circuits, in Article 725 for Class 2 and Class 3 remote-control and signaling circuits, and in Article 760 for fire alarm circuits.*

**(B) Portable Equipment.** The wiring for portable switchboards, stage set lighting, stage effects, and other wiring not fixed as to location shall be permitted with approved flexible cords and cables as provided elsewhere in Article 520. Fastening such cables and cords by uninsulated staples or nailing shall not be permitted.

**(C) Nonrated Construction.** Nonmetallic-sheathed cable, Type AC cable, electrical nonmetallic tubing, and rigid nonmetallic conduit shall be permitted to be installed in those buildings or portions thereof that are not required to be of fire-rated construction by the applicable building code.

Because theaters and similar buildings are usually required to be of fire-rated construction as determined by applicable building codes, the fixed wiring methods in 520.5 are limited. See the commentary for 518.4 on wiring methods where fire-rated construction is required.

The exception to the requirements for metal-enclosed or concrete-encased fixed wiring permits the installation of communications circuits, Class 2 and Class 3 remote-control and signaling circuits, sound-reproduction wiring, and fire alarm circuits using wiring methods from the respective articles covering these systems in Chapters 6, 7, and 8. Where portability, flexibility, and adjustments are necessary, suitable cords and cables are permitted. In accordance with 520.5(C), Type AC cable is permitted as one of the wiring methods in buildings or portions of buildings that are not required to be of fire-rated construction. In this application, Type AC cable is not required to contain an insulated equipment grounding conductor.

## 520.6 Number of Conductors in Raceway

The number of conductors permitted in any metal conduit, rigid nonmetallic conduit as permitted in this article, or electrical metallic tubing for circuits or for remote-control conductors shall not exceed the percentage fill shown in Table 1 of Chapter 9. Where contained within an auxiliary gutter or a wireway, the sum of the cross-sectional areas of all contained conductors at any cross section shall not exceed 20 percent of the interior cross-sectional area of the auxiliary gutter or wireway. The 30-conductor limitation of 366.22 and 376.22 shall not apply.

## 520.7 Enclosing and Guarding Live Parts

Live parts shall be enclosed or guarded to prevent accidental contact by persons and objects. All switches shall be of the externally operable type. Dimmers, including rheostats, shall be placed in cases or cabinets that enclose all live parts.

## 520.8 Emergency Systems

Control of emergency systems shall comply with Article 700.

## 520.9 Branch Circuits

A branch circuit of any size supplying one or more receptacles shall be permitted to supply stage set lighting. The voltage rating of the receptacles shall be not less than the circuit voltage. Receptacle ampere ratings and branch-circuit conductor ampacity shall be not less than the branch-circuit overcurrent device ampere rating. Table 210.21(B)(2) shall not apply.

The intent is to exclude the occupancies referenced in Article 520 from all the general requirements relating to connector rating and branch-circuit loading found elsewhere in the *Code*, such as in Table 210.21(B)(2). These requirements modify several other sections, such as 210.23(C) and (D), which would disallow 40-ampere and larger branch circuits from serving 5000-watt and larger portable stage lighting equipment found in theaters. They require only that connectors be rated sufficiently for the parameters involved, thus permitting connectors with voltage and current ratings higher than the branch-circuit rating to be used.

The stage set lighting and associated equipment, such as stage effects, both fixed and portable, must be as flexible as possible. Connectors are often used for different purposes and are therefore marked on a show-by-show basis to designate the voltage, current, and type of current actually employed. Stage set lighting is usually planned in advance, and the loads on each receptacle are known. Loads are not casually connected, as they might be at a typical general-use wall receptacle. Care is taken to ensure that circuits are not overloaded, thereby avoiding nuisance tripping during a performance.

## 520.10 Portable Equipment Used Outdoors

Portable stage and studio lighting equipment and portable power distribution equipment not identified for outdoor use shall be permitted for temporary use outdoors, provided the equipment is supervised by qualified personnel while energized and barriered from the general public.

Portable indoor stage or studio equipment that is not marked as suitable for wet or damp locations is permitted to be used

temporarily in outdoor locations. If rain occurs, this equipment is typically de-energized, and a protective cover is installed before it is re-energized. At the end of the day, this equipment is either de-energized and protected or dismantled and stored.

## II. Fixed Stage Switchboards

### 520.21 Dead Front

Stage switchboards shall be of the dead-front type and shall comply with Part IV of Article 408 unless approved based on suitability as a stage switchboard as determined by a qualified testing laboratory and recognized test standards and principles.

Stages, often with a great deal of flammable material present, are usually crowded. The intent of this dead-front requirement, along with the “guarded back” and “metal hood” requirements in 520.22 and 520.24, is to protect the operator from shock, to protect equipment on the board from falling objects, and to protect nearby flammable curtains and scenery from heat-producing equipment. As a result of these requirements, modern stage switchboards are totally enclosed as compared to early switchboards that were vertical marble or slate slabs mounted on the stage wall with exposed knife switches and fuseholders mounted on them and exposed resistance-type dimmer plates across the top.

### 520.22 Guarding Back of Switchboard

Stage switchboards having exposed live parts on the back of such boards shall be enclosed by the building walls, wire mesh grilles, or by other approved methods. The entrance to this enclosure shall be by means of a self-closing door.

### 520.23 Control and Overcurrent Protection of Receptacle Circuits

Means shall be provided at a stage-lighting switchboard to which load circuits are connected for overcurrent protection of stage-lighting branch circuits, including branch circuits supplying stage and auditorium receptacles used for cord-and-plug-connected stage equipment. Where the stage switchboard contains dimmers to control nonstage lighting, the locating of the overcurrent protective devices for these branch circuits at the stage switchboard shall be permitted.

Overcurrent devices are required at the stage-lighting switchboard. With older manual resistance or autotransformer dimmers this was typically readily accessible to stage personnel during a performance. Modern solid-state

dimmer racks are typically located in dimmer rooms away from the stage area.

### 520.24 Metal Hood

A stage switchboard that is not completely enclosed dead-front and dead-rear or recessed into a wall shall be provided with a metal hood extending the full length of the board to protect all equipment on the board from falling objects.

The space at the rear of a stage switchboard must be guarded to prevent entrance or contact by unqualified and unauthorized persons. One accepted method of accomplishing this is by enclosing the space between the rear of the switchboard and the wall in a sheet-steel housing with a door at one end.

### 520.25 Dimmers

A high-density digital dimmer rack typically contains one dimmer (usually of 20-, 50-, or 100-ampere capacity) for each branch circuit connected to it. The rack is usually serviced by a 3-phase, 4-wire-plus-ground feeder, which is distributed via buses to all dimmers in the rack. Typical dimmer racks contain between 12 and 96 dimmers and may have total power capacities of up to 288 kW. In large theatrical systems, many racks may be bused together. A central control electronics module drives multiple dimmers in the rack. A digital data link may connect the dimmer rack to a remotely located computer control console.

Exhibit 520.3 shows a high-density digital SCR dimmer switchboard. Dimmers for individual circuits are contained in dual plug-in dimmer modules. These modules also contain circuit breakers for overcurrent protection and filter chokes to eliminate acoustic noise from the lamp filaments. The digital control electronics are contained in a plug-in module with front-panel controls for configuration and testing.

Dimmers shall comply with 520.25(A) through (D).

**(A) Disconnection and Overcurrent Protection.** Where dimmers are installed in ungrounded conductors, each dimmer shall have overcurrent protection not greater than 125 percent of the dimmer rating and shall be disconnected from all ungrounded conductors when the master or individual switch or circuit breaker supplying such dimmer is in the open position.

**(B) Resistance- or Reactor-Type Dimmers.** Resistance- or series reactor-type dimmers shall be permitted to be placed in either the grounded or the ungrounded conductor of the circuit. Where designed to open either the supply cir-

**EXHIBIT 520.3** A typical high-density digital SCR dimmer switchboard. (Courtesy of Electronic Theatre Controls, Inc.)

cuit to the dimmer or the circuit controlled by it, the dimmer shall then comply with 404.2(B). Resistance- or reactor-type dimmers placed in the grounded neutral conductor of the circuit shall not open the circuit.

**(C) Autotransformer-Type Dimmers.** The circuit supplying an autotransformer-type dimmer shall not exceed 150 volts between conductors. The grounded conductor shall be common to the input and output circuits.

Informational Note: See 210.9 for circuits derived from autotransformers.

Circuits supplying autotransformer-type dimmers are not permitted to exceed 150 volts between conductors. Any desired voltage may be applied to the lamps, from full-line voltage to voltage so low that the lamps provide no illumination, by means of a movable contact tap. This type of dim-

mer produces very little heat and operates at high efficiency. Its dimming effect, within its maximum rating, is independent of the wattage of the load. See the commentary that follows 470.1, which discusses saturable reactors that are sometimes used for stage dimmers.

**(D) Solid-State-Type Dimmers.** The circuit supplying a solid-state dimmer shall not exceed 150 volts between conductors unless the dimmer is listed specifically for higher voltage operation. Where a grounded conductor supplies a dimmer, it shall be common to the input and output circuits. Dimmer chassis shall be connected to the equipment grounding conductor.

Solid-state stage dimmers are often used since modern stage switchboards are usually of the remote-control type. The switchboard or dimmer rack is normally located offstage in a dimmer room, where proper climate control can be furnished and noise from the rack cooling fans does not interfere with the performance onstage. Branch circuits are usually connected to the dimmer rack on a dimmer-per-circuit basis. A digital control cable connects the dimmer rack to a remote computer lighting control console, such as the one shown in Exhibit 520.4, which can be located on stage or in the auditorium in view of the stage.

**EXHIBIT 520.4** An electronic computer lighting control console for remotely controlling solid-state-type dimmers. (Courtesy of Electronic Theatre Controls, Inc.)

## 520.26 Type of Switchboard

A stage switchboard shall be either one or a combination of the types specified in 520.26(A), (B), and (C).

**(A) Manual.** Dimmers and switches are operated by handles mechanically linked to the control devices.

Manual switchboards usually contain resistance-type or autotransformer-type dimmers.

**(B) Remotely Controlled.** Devices are operated electrically from a pilot-type control console or panel. Pilot control panels either shall be part of the switchboard or shall be permitted to be at another location.

**(C) Intermediate.** A stage switchboard with circuit interconnections is a secondary switchboard (patch panel) or panelboard remote to the primary stage switchboard. It shall contain overcurrent protection. Where the required branch-circuit overcurrent protection is provided in the dimmer panel, it shall be permitted to be omitted from the intermediate switchboard.

The intermediate stage switchboard located between the dimmer switchboard and the branch circuits is usually called a patch panel. Its purpose is to break down larger dimmer circuits to smaller branch circuits, to select the branch circuits to be controlled by a dimmer, or both.

### 520.27 Stage Switchboard Feeders

**(A) Type of Feeder.** Feeders supplying stage switchboards shall be one of the types in 520.27(A)(1) through (A)(3).

**(1) Single Feeder.** A single feeder disconnected by a single disconnect device.

**(2) Multiple Feeders to Intermediate Stage Switchboard (Patch Panel).** Multiple feeders of unlimited quantity shall be permitted, provided that all multiple feeders are part of a single system. Where combined, neutral conductors in a given raceway shall be of sufficient ampacity to carry the maximum unbalanced current supplied by multiple feeder conductors in the same raceway, but they need not be greater than the ampacity of the neutral conductor supplying the primary stage switchboard. Parallel neutral conductors shall comply with 310.10(H).

The feeders are often many dimmer-controlled circuits at 100 amperes or less, single phase, so they can be distributed to different combinations of the same size or smaller branch circuits. This type of installation usually requires a common neutral, and because of the quantity of circuits, many installations require several parallel neutrals running in several raceways. Generally, these parallel neutrals are sized as follows:

1. Size the common neutral to the feeder of the primary switchboard.

2. Split this neutral into multiple parallel conductors, one per raceway.
3. Equally divide, per phase, and size each ungrounded conductor of the many single-phase circuits among the raceways.

In no case is it permitted to install the ungrounded conductors in one raceway and the common neutral in another.

**(3) Separate Feeders to Single Primary Stage Switchboard (Dimmer Bank).** Installations with separate feeders to a single primary stage switchboard shall have a disconnecting means for each feeder. The primary stage switchboard shall have a permanent and obvious label stating the number and location of disconnecting means. If the disconnecting means are located in more than one distribution switchboard, the primary stage switchboard shall be provided with barriers to correspond with these multiple locations.

Large primary stage switchboards usually consist of several sections, often called dimmer racks, that form a dimmer bank. The dimmer racks may be fed separately or may be bused together to accept one or more feeder circuits. If an intermediate stage switchboard is connected to a primary stage switchboard, a single large feeder usually supplies the primary stage switchboard, because the intermediate stage switchboard patches only the ungrounded conductors and requires a common neutral. Modern theaters do not use intermediate stage switchboards, and dimmer banks may have one or several feeders.

**(B) Neutral Conductor.** For the purpose of ampacity adjustment, the following shall apply:

- (1) The neutral conductor of feeders supplying solid-state, phase-control 3-phase, 4-wire dimming systems shall be considered a current-carrying conductor.
- (2) The neutral conductor of feeders supplying solid-state, sine wave 3-phase, 4-wire dimming systems shall not be considered a current-carrying conductor.
- (3) The neutral conductor of feeders supplying systems that use or may use both phase-control and sine wave dimmers shall be considered as current-carrying.

With the use of solid-state dimmers, it is not necessary to consider the neutral as a current-carrying conductor in every instance. If the sine-wave-type dimmer is the only type in use, the neutral of the circuits supplying it need not be considered as a current-carrying conductor. However, if phase-control dimmers are used, or if combinations of phase-control and

sine-wave-type dimmers are connected to the same feeder or branch circuit, the neutral conductor must be considered as a current-carrying conductor. The neutral of feeders supplying solid-state, 3-phase, 4-wire dimming systems carries third-harmonic currents that are present even under balanced load conditions.

**(C) Supply Capacity.** For the purposes of calculating supply capacity to switchboards, it shall be permissible to consider the maximum load that the switchboard is intended to control in a given installation, provided that the following apply:

- (1) All feeders supplying the switchboard shall be protected by an overcurrent device with a rating not greater than the ampacity of the feeder.
- (2) The opening of the overcurrent device shall not affect the proper operation of the egress or emergency lighting systems.

Informational Note: For calculation of stage switchboard feeder loads, see 220.40.

Section 520.27 permits the feeder for a single, primary stage switchboard to be sized in accordance with the maximum load the switchboard is intended to control for a specific location. The feeder(s) must be protected by an overcurrent device that has a rating not greater than the feeder ampacity. Operation of the overcurrent device is not allowed to have any effect on egress or emergency lighting systems.

### III. Fixed Stage Equipment Other Than Switchboards

#### 520.41 Circuit Loads

**(A) Circuits Rated 20 Amperes or Less.** Footlights, border lights, and proscenium sidelights shall be arranged so that no branch circuit supplying such equipment carries a load exceeding 20 amperes.

**(B) Circuits Rated Greater Than 20 Amperes.** Where only heavy-duty lampholders are used, such circuits shall be permitted to comply with Article 210 for circuits supplying heavy-duty lampholders.

In accordance with 210.23(B) and (C), 30-, 40-, or 50-ampere branch circuits are permitted if heavy-duty lampholders, such as medium- or mogul-base Edison screw shell types, are used for fixed lighting.

#### 520.42 Conductor Insulation

Foot, border, proscenium, or portable strip lights and connector strips shall be wired with conductors that have insulation suitable for the temperature at which the conductors are operated, but not less than 125°C (257°F). The ampacity of the 125°C (257°F) conductors shall be that of 60°C (140°F) conductors. All drops from connector strips shall be 90°C (194°F) wire sized to the ampacity of 60°C (140°F) cords and cables with no more than 150 mm (6 in.) of conductor extending into the connector strip. Section 310.15(B)(3)(a) shall not apply.

Informational Note: See Table 310.104(A) for conductor types.

The 125°C minimum temperature rating is based on the heat from the lamps raising the ambient temperature in which the wiring is located. Drops from connector strips are usually flexible cord. Although the 90°C-rated cord is also in the higher ambient, it is not in sufficient contact with other circuits that might also heat it. The derating factors of 310.15(B)(3)(a) are judged unnecessary because the conductors are not all energized at one time, are not often energized at full intensity (dimmed), and are not energized continuously.

#### 520.43 Footlights

**(A) Metal Trough Construction.** Where metal trough construction is employed for footlights, the trough containing the circuit conductors shall be made of sheet metal not lighter than 0.81 mm (0.032 in.) and treated to prevent oxidation. Lampholder terminals shall be kept at least 13 mm (½ in.) from the metal of the trough. The circuit conductors shall be soldered to the lampholder terminals.

**(B) Other-Than-Metal Trough Construction.** Where the metal trough construction specified in 520.43(A) is not used, footlights shall consist of individual outlets with lampholders wired with rigid metal conduit, intermediate metal conduit, or flexible metal conduit, Type MC cable, or mineral-insulated, metal-sheathed cable. The circuit conductors shall be soldered to the lampholder terminals.

**(C) Disappearing Footlights.** Disappearing footlights shall be arranged so that the current supply is automatically disconnected when the footlights are replaced in the storage recesses designed for them.

The footlights described in 520.43(A) and (B) are generally obsolete units that were built in the field. Modern footlights are compartmentalized, factory-wired assemblies for field installation, as shown in Exhibit 520.5 and may be permanently

exposed or be of the disappearing type. Disappearing footlights must automatically disconnect the current supply when the footlights are in the closed position, thereby preventing heat entrapment that could cause a fire. Disconnection is accomplished by mercury switches in the terminal compartment.

**EXHIBIT 520.5** Disappearing footlights.

#### 520.44 Borders, Proscenium Sidelights, Drop Boxes, and Connector Strips

**(A) General.** Borders and proscenium sidelights shall be as follows:

- (1) Constructed as specified in 520.43
- (2) Suitably stayed and supported
- (3) Designed so that the flanges of the reflectors or other adequate guards protect the lamps from mechanical damage and from accidental contact with scenery or other combustible material

Both of these types of stage lighting instruments must be suitably supported and protected from mechanical damage. Exhibit 520.6 shows a suspended border light installed over a stage, and Exhibit 520.7 is a cross-sectional view that il-

**EXHIBIT 520.6** A suspended border light assembly for installation over a stage.

**EXHIBIT 520.7** A cross-sectional view of a typical light in the border light assembly shown in Exhibit 520.6.

lustrates construction details. This particular border light is designed for 200-watt lamps. To obtain the highest illumination efficiency, each lamp is provided with its own reflector, to which is fitted a glass roundel, available in any color. Commonly, lampholders are wired alternately on three or four circuits. A splice box is provided on top of the housing for enclosing connections between the cable supplying the border light and the border light's internal wiring, which consists of wiring from the splice box to the lamp sockets in a trough extending the length of the border.

**(B) Connector Strips and Drop Boxes.** Connector strips and drop boxes shall be as follows:

- (1) Suitably stayed and supported
- (2) Listed as stage and studio wiring devices

Section 520.46 refers to 520.44(C) for supply cable for connector strip and drop boxes. Section 520.44(B) requires that these devices be listed for the purpose.

**(C) Cords and Cables for Border Lights, Drop Boxes, and Connector Strips.**

**(1) General.** Cords and cables for supply to border lights, drop boxes, and connector strips shall be listed for extra-hard usage. The cords and cables shall be suitably supported. Such cords and cables shall be employed only where flexible conductors are necessary. Ampacity of the conductors shall be as provided in 400.5.

Border lights, illustrated in Exhibit 520.7, are typically supported by steel cables to facilitate height adjustment for cleaning and lamp replacement and the circuit conductors supplying the border lights are carried to each border light in flexible cable. Each of these flexible cables usually contains many circuits; however, its overall length is limited by its ability to travel up and down without getting tangled.

**(2) Cords and Cables Not in Contact with Heat-Producing Equipment.** Listed multiconductor extra-hard-usage-type cords and cables not in direct contact with equipment containing heat-producing elements shall be permitted to have their ampacity determined by Table 520.44. Maximum load current in any conductor with an ampacity determined by Table 520.44 shall not exceed the values in Table 520.44.

Extra-hard-usage cords and cables not in direct contact with heat-producing equipment are permitted to have their ampacity determined by Table 520.44 instead of 400.5(A).

Table 520.44 is based on a minimum 50 percent diversity factor. It also makes allowance for the fact that not all circuits are on at the same time, not all circuits are at full intensity (dimmed), and not all circuits are on for a long period of time. If the load diversity does not follow this pattern, such as border lights that are all left on at full intensity to light the stage for rehearsal, lecture, or classroom purposes, Table 520.44 must not be used.

**(3) Identification of Conductors in Multiconductor Extra-hard Usage Cords and Cables.** Grounded (neutral) conductors shall be white without stripe or shall be identified by a distinctive white marking at their terminations. Grounding conductors shall be green with or without yellow stripe or shall be identified by a distinctive green marking at their terminations.

**520.45 Receptacles**

Receptacles for electrical equipment on stages shall be rated in amperes. Conductors supplying receptacles shall be in accordance with Articles 310 and 400.

**TABLE 520.44 Ampacity of Listed Extra-Hard-Usage Cords and Cables with Temperature Ratings of 75°C (167°F) and 90°C (194°F)\* [Based on Ambient Temperature of 30°C (86°F)]**

Size (AWG)	Temperature Rating of Cords and Cables		Maximum Rating of Overcurrent Device
	75°C (167°F)	90°C (194°F)	
14	24	28	15
12	32	35	20
10	41	47	25
8	57	65	35
6	77	87	45
4	101	114	60
2	133	152	80

\*Ampacity shown is the ampacity for multiconductor cords and cables where only three copper conductors are current-carrying as described in 400.5. If the number of current-carrying conductors in a cord or cable exceeds three and the load diversity factor is a minimum of 50 percent, the ampacity of each conductor shall be reduced as shown in the following table:

Number of Conductors	Percent of Ampacity
4–6	80
7–24	70
25–42	60
43 and above	50

Note: Ultimate insulation temperature. In no case shall conductors be associated together in such a way with respect to the kind of circuit, the wiring method used, or the number of conductors such that the temperature limit of the conductors is exceeded.

A neutral conductor that carries only the unbalanced current from other conductors of the same circuit need not be considered as a current-carrying conductor.

In a 3-wire circuit consisting of two phase conductors and the neutral conductor of a 4-wire, 3-phase, wye-connected system, the neutral conductor carries approximately the same current as the line-to-neutral currents of the other conductors and shall be considered to be a current-carrying conductor.

On a 4-wire, 3-phase wye circuit where the major portion of the load consists of nonlinear loads, there are harmonic currents in the neutral conductor. Therefore, the neutral conductor shall be considered to be a current-carrying conductor.

**520.46 Connector Strips, Drop Boxes, Floor Pockets, and Other Outlet Enclosures**

Receptacles for the connection of portable stage-lighting equipment shall be pendant or mounted in suitable pockets or enclosures and shall comply with 520.45. Supply cables for connector strips and drop boxes shall be as specified in 520.44(C).

Exhibit 520.8 shows a hanging connector strip with its associated hardware and flexible cable allowing for height

**EXHIBIT 520.8** A suspended connector strip with border lights attached.

adjustment. Border lights (Exhibit 520.7) are hung and supplied in a similar manner. Exhibits 520.9 and 520.10 illustrate two other types of connections for portable stage lighting equipment.

**EXHIBIT 520.10** A typical three-circuit connector strip designed for wall or pipe mounting. (Courtesy of Electronic Theatre Controls, Inc.)

**EXHIBIT 520.9** A 4-gang, 4-receptacle pin-plug outlet box designed for flush mounting. (Courtesy of Electronic Theatre Controls, Inc.)

### 520.47 Backstage Lamps (Bare Bulbs)

Lamps (bare bulbs) installed in backstage and ancillary areas where they can come in contact with scenery shall be located and guarded so as to be free from physical damage and shall provide an air space of not less than 50 mm (2 in.) between such lamps and any combustible material.

*Exception: Decorative lamps installed in scenery shall not be considered to be backstage lamps for the purpose of this section.*

### 520.48 Curtain Machines

Curtain machines shall be listed.

### 520.49 Smoke Ventilator Control

Where stage smoke ventilators are released by an electrical device, the circuit operating the device shall be normally closed and shall be controlled by at least two externally operable switches, one switch being placed at a readily accessible location on stage and the other where designated by the authority having jurisdiction. The device shall be designed for the full voltage of the circuit to which it is connected, no resistance being inserted. The device shall be located in the loft above the scenery and shall be enclosed in a suitable metal box having a tight, self-closing door.

In addition to the control of smoke ventilators from two externally operable switches at different locations, the design of a normally closed circuit ensures that smoke ventilators operate when the circuit opens for any reason, such as a circuit breaker tripping or a fuse blowing.

## IV. Portable Switchboards on Stage

### 520.50 Road Show Connection Panel (A Type of Patch Panel)

A panel designed to allow for road show connection of portable stage switchboards to fixed lighting outlets by means of permanently installed supplementary circuits. The panel, supplementary circuits, and outlets shall comply with 520.50(A) through (D).

Also known as a road show interconnect or intercept panel, a road show connection panel is designed to connect the load side of a portable switchboard to the fixed building branch circuits and associated outlets. It may also provide for the fixed branch circuits to be connected to a fixed switchboard when the portable switchboard is not installed.

**(A) Load Circuits.** Circuits shall originate from ground-ing-type polarized inlets of current and voltage rating that match the fixed-load receptacle.

The required grounding-type polarized inlets may be flush or pendant. The fixed-load receptacle is on the other end of the branch circuit that emanates from the road show connection panel.

**(B) Circuit Transfer.** Circuits that are transferred between fixed and portable switchboards shall have all circuit conductors transferred simultaneously.

The required simultaneous transfer of all conductors of the circuit includes any grounded conductors.

**(C) Overcurrent Protection.** The supply devices of these supplementary circuits shall be protected by branch-circuit overcurrent protective devices. Each supplementary circuit, within the road show connection panel and theater, shall be protected by branch-circuit overcurrent protective devices installed within the road show connection panel.

The branch-circuit overcurrent protection normally should be in the switchboard, but because some older units do not have this protection, backup overcurrent protection is provided in the road show connection panel.

**(D) Enclosure.** Panel construction shall be in accordance with Article 408.

### 520.51 Supply

Portable switchboards shall be supplied only from power outlets of sufficient voltage and ampere rating. Such power outlets shall include only externally operable, enclosed fused switches or circuit breakers mounted on stage or at the permanent switchboard in locations readily accessible from the stage floor. Provisions for connection of an equipment grounding conductor shall be provided. For the purposes of conductor derating, the requirements of 520.27(B) shall apply.

Power outlets, known in the entertainment industry as company switches or bull switches, are the point in the wiring system where portable feeder cables connect to the fixed building wiring. They may be as simple as an overcurrent-protected multipole receptacle designed to accept the supply cable described in 520.53(P), Exception, or they may be multiple sets of parallel single-conductor feeder cables. These single-conductor feeder cables, as described in 520.53(H), may be terminated via single-pole separable connectors, as described in 520.53(K), or directly to busbars, fused disconnect switches, or circuit breakers with wire connectors (lugs).

### 520.52 Overcurrent Protection for Branch Circuits

Portable switchboards shall contain overcurrent protection for branch circuits. The requirements of 210.23 shall not apply.

### 520.53 Construction and Feeders

Portable switchboards and feeders for use on stages shall comply with 520.53(A) through (P).

Exhibit 520.11 illustrates a portable switchboard known as a rolling rack.

**EXHIBIT 520.11** A large, portable SCR dimmer switchboard (rolling rack). (Courtesy of Electronic Theatre Controls, Inc.)

**(A) Enclosure.** Portable switchboards shall be placed within an enclosure of substantial construction, which shall be permitted to be arranged so that the enclosure is open during operation. Enclosures of wood shall be completely lined with sheet metal of not less than 0.51 mm (0.020 in.) and shall be well galvanized, enameled, or otherwise properly coated to prevent corrosion or be of a corrosion-resistant material.

**(B) Energized Parts.** There shall not be exposed energized parts within the enclosure.

**(C) Switches and Circuit Breakers.** All switches and circuit breakers shall be of the externally operable, enclosed type.

**(D) Circuit Protection.** Overcurrent devices shall be provided in each ungrounded conductor of every circuit sup-

plied through the switchboard. Enclosures shall be provided for all overcurrent devices in addition to the switchboard enclosure.

**(E) Dimmers.** The terminals of dimmers shall be provided with enclosures, and dimmer faceplates shall be arranged such that accidental contact cannot be readily made with the faceplate contacts.

**(F) Interior Conductors.**

**(1) Type.** All conductors other than busbars within the switchboard enclosure shall be stranded. Conductors shall be approved for an operating temperature at least equal to the approved operating temperature of the dimming devices used in the switchboard and in no case less than the following:

- (1) Resistance-type dimmers — 200°C (392°F); or
- (2) Reactor-type, autotransformer, and solid-state dimmers — 125°C (257°F)

**(2) Protection.** Each conductor shall have an ampacity not less than the rating of the circuit breaker, switch, or fuse that it supplies. Circuit interrupting and bus bracing shall be in accordance with 110.9 and 110.10. The short-circuit current rating shall be marked on the switchboard.

Conductors shall be enclosed in metal wireways or shall be securely fastened in position and shall be bushed where they pass through metal.

**(G) Pilot Light.** A pilot light shall be provided within the enclosure and shall be connected to the circuit supplying the board so that the opening of the master switch does not cut off the supply to the lamp. This lamp shall be on an individual branch circuit having overcurrent protection rated or set at not over 15 amperes.

This requirement applies only to switchboards with a main disconnect, if provided, on the switchboard. The pilot light serves as a warning at the switchboard that indicates the presence of power before the main disconnect is activated.

**(H) Supply Conductors.**

**(1) General.** The supply to a portable switchboard shall be by means of listed extra-hard usage cords or cables. The supply cords or cable shall terminate within the switchboard enclosure, in an externally operable fused master switch or circuit breaker or in a connector assembly identified for the purpose. The supply cords or cable (and connector assembly) shall have current ratings not less than the total load connected to the switchboard and shall be protected by overcurrent devices.

As with the supply end described in 520.51, the termination connection required in 520.53(H)(1) could be as simple as a permanently terminated multiconductor supply cord or multipole connector assembly (inlet) or as complex as a set of parallel single-conductor feeder cables. These cables may be field-connected to an assembly of single-pole connectors (inlet) or directly connected, with wire connectors, to bus-bars or a fused switch or breaker.

Section 520.53(H)(1) permits road shows with fixed lighting plans to size the feeder to the actual connected load rather than sizing it based on the overcurrent protection rating.

**(2) Single-Conductor Cables.** Single-conductor portable supply cable sets shall be not smaller than 2 AWG conductors. The equipment grounding conductor shall not be smaller than 6 AWG conductor. Single-conductor grounded neutral cables for a supply shall be sized in accordance with 520.53(O)(2). Where single conductors are paralleled for increased ampacity, the paralleled conductors shall be of the same length and size. Single-conductor supply cables shall be grouped together but not bundled. The equipment grounding conductor shall be permitted to be of a different type, provided it meets the other requirements of this section, and it shall be permitted to be reduced in size as permitted by 250.122. Grounded (neutral) and equipment grounding conductors shall be identified in accordance with 200.6, 250.119, and 310.110. Grounded conductors shall be permitted to be identified by marking at least the first 150 mm (6 in.) from both ends of each length of conductor with white or gray. Equipment grounding conductors shall be permitted to be identified by marking at least the first 150 mm (6 in.) from both ends of each length of conductor with green or green with yellow stripes. Where more than one nominal voltage exists within the same premises, each ungrounded conductor shall be identified by system.

**(3) Supply Conductors Not Over 3.0 m (10 ft) Long.** Where supply conductors do not exceed 3.0 m (10 ft) in length between supply and switchboard or supply and a subsequent overcurrent device, the supply conductors shall be permitted to be reduced in size where all of the following conditions are met:

- (1) The ampacity of the supply conductors shall be at least one-quarter of the **current rating** of the supply overcurrent **protective device**.
- (2) The supply conductors shall terminate in a single overcurrent **protective device** that will limit the load to the ampacity of the supply conductors. This single overcurrent device shall be permitted to supply additional overcurrent devices on its load side.
- (3) The supply conductors shall not penetrate walls, floors, or ceilings or be run through doors or traffic areas. The

supply conductors shall be adequately protected from physical damage.

- (4) The supply conductors shall be suitably terminated in an approved manner.
- (5) Conductors shall be continuous without splices or connectors.
- (6) Conductors shall not be bundled.
- (7) Conductors shall be supported above the floor in an approved manner.

**(4) Supply Conductors Not Over 6.0 m (20 ft) Long.** Where supply conductors do not exceed 6.0 m (20 ft) in length between supply and switchboard or supply and a subsequent overcurrent protection device, the supply conductors shall be permitted to be reduced in size where all of the following conditions are met:

- (1) The ampacity of the supply conductors shall be at least one-half of the **current rating** of the supply overcurrent **protective device**.
- (2) The supply conductors shall terminate in a single overcurrent **protective device** that limits the load to the ampacity of the supply conductors. This single overcurrent device shall be permitted to supply additional overcurrent devices on its load side.
- (3) The supply conductors shall not penetrate walls, floors, or ceilings or be run through doors or traffic areas. The supply conductors shall be adequately protected from physical damage.
- (4) The supply conductors shall be suitably terminated in an approved manner.
- (5) The supply conductors shall be supported in an approved manner at least 2.1 m (7 ft) above the floor except at terminations.
- (6) The supply conductors shall not be bundled.
- (7) Tap conductors shall be in unbroken lengths.

Similar to the requirements for taps in 240.21, the intent of 520.53(H)(3) and (H)(4) is that supply conductors for portable switchboards be sized according to their overcurrent protection, not by the total connected load. Loads of 144 kVA and greater are not uncommon, even on portable switchboard equipment. Installations in the field include lighting for theatrical-type productions with large numbers of stage lighting fixtures. However, only a fraction of the many fixtures installed are used at any one time.

The tap rules of 520.53(H)(3) and (H)(4) are designed to allow one or more switchboards with smaller feeders to be connected to larger supplies (company switches). If these “rules” are not complied with, proper overcurrent protection devices, either fixed or portable, must be provided for each of the smaller switchboards.

The purpose of requiring that conductors not be bundled is so that column D of Table 400.5(A)(2) can be employed.

If the conductors were bundled, column F and all applicable derating factors would apply. Most devices used in the theater to terminate single-conductor cables are rated for use at 90°C ampacity. However, if single-conductor cables are terminated directly to a circuit breaker or fused switch, a 75°C ampacity or lower most likely would apply.

**(5) Supply Conductors Not Reduced in Size.** Supply conductors not reduced in size under provisions of 520.53(H)(3) or (H)(4) shall be permitted to pass through holes in walls specifically designed for the purpose. If penetration is through the fire-resistant-rated wall, it shall be in accordance with 300.21.

**(I) Cable Arrangement.** Cables shall be protected by bushings where they pass through enclosures and shall be arranged so that tension on the cable is not transmitted to the connections. Where power conductors pass through metal, the requirements of 300.20 shall apply.

Tension on the connections can be removed by using conventional strain relief devices or, often, by lashing the cable to the enclosure with rope.

**(J) Number of Supply Interconnections.** Where connectors are used in a supply conductor, there shall be a maximum number of three interconnections (mated connector pairs) where the total length from supply to switchboard does not exceed 30 m (100 ft). In cases where the total length from supply to switchboard exceeds 30 m (100 ft), one additional interconnection shall be permitted for each additional 30 m (100 ft) of supply conductor.

The intent is to prevent the addition of excessive numbers of interconnections that could jeopardize the mechanical and electrical integrity of the supply conductors.

**(K) Single-Pole Separable Connectors.** Where single-pole portable cable connectors are used, they shall be listed and of the locking type. Sections 400.10, 406.7, and 406.8 shall not apply to listed single-pole separable connectors and single-conductor cable assemblies utilizing listed single-pole separable connectors. Where paralleled sets of current-carrying, single-pole separable connectors are provided as input devices, they shall be prominently labeled with a warning indicating the presence of internal parallel connections. The use of single-pole separable connectors shall comply with at least one of the following conditions:

- (1) Connection and disconnection of connectors are possible only where the supply connectors are interlocked to

the source and it is not possible to connect or disconnect connectors when the supply is energized.

- (2) Line connectors are of the listed sequential-interlocking type so that load connectors shall be connected in the following sequence:
  - a. Equipment grounding conductor connection
  - b. Grounded circuit conductor connection, if provided
  - c. Ungrounded conductor connection, and that disconnection shall be in the reverse order
- (3) A caution notice shall be provided adjacent to the line connectors indicating that plug connection shall be in the following order:
  - a. Equipment grounding conductor connectors
  - b. Grounded circuit conductor connectors, if provided
  - c. Ungrounded conductor connectors, and that disconnection shall be in the reverse order

These requirements provide for a special type of connection device suitable for connecting single-conductor feeder cables. The listed connection device must be of the locking type, reducing the likelihood of its separating while under load. The connectors must be used in sets because they are only single-pole types. The connector sets must be arranged so as to reduce the likelihood that connections are made in the incorrect order, in accordance with one of the following methods:

1. A scheme whereby the main disconnect cannot be energized until all conductors are connected
2. A scheme whereby the connectors are precluded from being connected in any order other than the proper one (first make/last break of the grounding conductor and connect next-to-first and disconnect next-to-last for the grounded conductor)
3. A scheme whereby the individual connectors, free of any special electromechanical intervention, are marked with instructions to the user regarding proper connection

Single-pole separable connectors are quick-connect feeder splicing and terminating devices, not attachment plugs or receptacles. They are designed to be sized, terminated, and inspected by a qualified person before being energized and are to be guarded from accidental disconnection before being de-energized.

**(L) Protection of Supply Conductors and Connectors.** All supply conductors and connectors shall be protected against physical damage by an approved means. This protection shall not be required to be raceways.

Rubber mats and commercially available rubber bridges often are used to protect supply conductors and connectors.

**(M) Flanged Surface Inlets.** Flanged surface inlets (recessed plugs) that are used to accept the power shall be rated in amperes.

**(N) Terminals.** Terminals to which stage cables are connected shall be located so as to permit convenient access to the terminals.

This requirement facilitates the field connection and disconnection of the large feeder cables as a show travels from place to place.

### **(O) Neutral Conductor.**

**(1) Neutral Terminal.** In portable switchboard equipment designed for use with 3-phase, 4-wire with ground supply, the current rating of the supply neutral terminal, and the ampacity of its associated busbar or equivalent wiring, or both, shall have an ampacity equal to at least twice the ampacity of the largest ungrounded supply terminal.

*Exception: Where portable switchboard equipment is specifically constructed and identified to be internally converted in the field, in an approved manner, from use with a balanced 3-phase, 4-wire with ground supply to a balanced single-phase, 3-wire with ground supply, the supply neutral terminal and its associated busbar, equivalent wiring, or both, shall have an ampacity equal to at least that of the largest ungrounded single-phase supply terminal.*

**(2) Supply Neutral Conductor.** The power supply conductors for portable switchboards utilizing solid-state phase-control dimmers shall be sized considering the neutral conductor as a current-carrying conductor for ampacity adjustment purposes. The power supply conductors for portable switchboards utilizing only solid-state sine wave dimmers shall be sized considering the neutral conductor as a non-current-carrying conductor for ampacity adjustment purposes. Where single-conductor feeder cables, not installed in raceways, are used on multiphase circuits feeding portable switchboards containing solid-state phase-control dimmers, the neutral conductor shall have an ampacity of at least 130 percent of the ungrounded circuit conductors feeding the portable switchboard. Where such feeders are supplying only solid-state sine wave dimmers, the neutral conductor shall have an ampacity of at least 100 percent of the ungrounded circuit conductors feeding the portable switchboard.

Section 520.53(O)(1) involves overlapping concepts regarding the neutral conductor in power supplies for portable switchboards. If a 3-phase, 4-wire switchboard of any kind is brought into a space that has only single-phase, 3-wire

service, the switchboard most likely will be connected with two phases to one leg and one phase to the other. This connection could double the current flowing through the neutral, so the neutral must be double size to allow for that possibility. The exception to 520.53(O)(1) provides for a smaller neutral sized for the single-phase feed where a switchboard contains switching devices that can divide the B-phase load equally between the A-phase and C-phase buses for single-phase operation.

Additionally from 520.53(O)(2), 3-phase, 4-wire switchboards that contain solid-state phase-control dimming devices must, when connected to a 3-phase, 4-wire supply, be connected to that supply with a multiconductor cable sized by counting the neutral as a current-carrying conductor or with a set of single-conductor cables where the neutral is sized 130 percent greater than the phases.

### **Application Example**

A 3-phase, 4-wire switchboard containing six 50-ampere SCR dimmers (100 amperes per phase) without a reassignment switching system would have to have a 200-ampere neutral. (A single-phase, 3-wire-only switchboard would not have to meet this special requirement.) This 200 percent rule would cover all the components making up the neutral conductor system inside or permanently attached to the switchboard, to allow for a full-size, single-phase, 3-wire feed when two of the 3-phase, 4-wire phase conductors are terminated to one single-phase, 3-wire leg. Note that the 200 percent neutral already covers the derating requirements (125 percent for a multiconductor feeder system and 130 percent for a single-conductor feeder system) when used in the 3-phase mode. If a reassignment system were added, the neutral would be required to be only 150 amperes. Again, when used in the 3-phase mode, the derating factors would be covered.

The double-neutral requirement covers the terminal and associated busbar or wiring. This requirement begins at the main input terminals or busing, main input inlet connector, or attached main input cord-and-plug set and includes all wiring on the load side of that point.

Power supply feeders easily detached at the terminals or inlet connector need not adhere to the 200 percent neutral rule, because they can easily be sized on a show-by-show basis for the type of supply encountered. These cables must, however, adhere to the requirements of the neutral as a current-carrying conductor or to the requirements of the 130 percent single-conductor-cable neutral.

Solid-state sine-wave dimmers are linear devices that do not add nonlinear loads to the neutral conductor. Where feeders supply solid-state sine-wave dimmers, the neutral conductor is sized by considering it as a non-current-carrying conductor. However, it must have an ampacity of at least 100 percent of the ampacity of the phase conductors.

**(P) Qualified Personnel.** The routing of portable supply conductors, the making and breaking of supply connectors and other supply connections, and the energization and de-energization of supply services shall be performed by qualified personnel, and portable switchboards shall be so marked, indicating this requirement in a permanent and conspicuous manner.

*Exception: A portable switchboard shall be permitted to be connected to a permanently installed supply receptacle by other than qualified personnel, provided that the supply receptacle is protected for its current rating by an overcurrent device of not greater than 150 amperes, and where the receptacle, interconnection, and switchboard comply with all of the following:*

- (a) Employ listed multipole connectors suitable for the purpose for every supply interconnection
- (b) Prevent access to all supply connections by the general public
- (c) Employ listed extra-hard usage multiconductor cords or cables with an ampacity not less than the load and not less than the ampere rating of the connectors.

The intent is to divide the acceptable practices in what are most likely to be professional and professional-grade educational venues (qualified) from those in amateur or amateur-grade educational venues (other than qualified). The basic requirements allow for such things as single-conductor feeder systems, feeders sized for the current-connected load, tap rules, and so on, and require the services of a qualified person. The exception provides for a conventional feeder system suitable for use by an untrained person.

## V. Portable Stage Equipment Other Than Switchboards

### 520.61 Arc Lamps

Arc lamps, including enclosed arc lamps and associated ballasts, shall be listed. Interconnecting cord sets and interconnecting cords and cables shall be extra-hard usage type and listed.

### 520.62 Portable Power Distribution Units

Portable power distribution units shall comply with 520.62(A) through (E).

**(A) Enclosure.** The construction shall be such that no current-carrying part will be exposed.

**(B) Receptacles and Overcurrent Protection.** Receptacles shall comply with 520.45 and shall have branch-circuit

overcurrent protection in the box. Fuses and circuit breakers shall be protected against physical damage. Flexible cords or cables supplying pendant receptacles or cord connectors shall be listed for extra-hard usage.

**(C) Busbars and Terminals.** Busbars shall have an ampacity equal to the sum of the ampere ratings of all the circuits connected to the busbar. Lugs shall be provided for the connection of the master cable.

**(D) Flanged Surface Inlets.** Flanged surface inlets (recessed plugs) that are used to accept the power shall be rated in amperes.

**(E) Cable Arrangement.** Cables shall be adequately protected where they pass through enclosures and be arranged so that tension on the cable is not transmitted to the terminations.

### 520.63 Bracket Fixture Wiring

**(A) Bracket Wiring.** Brackets for use on scenery shall be wired internally, and the fixture stem shall be carried through to the back of the scenery where a bushing shall be placed on the end of the stem. Externally wired brackets or other fixtures shall be permitted where wired with cords designed for hard usage that extend through scenery and without joint or splice in canopy of fixture back and terminate in an approved-type stage connector located, where practical, within 450 mm (18 in.) of the fixture.

**(B) Mounting.** Fixtures shall be securely fastened in place.

### 520.64 Portable Strips

Portable strips shall be constructed in accordance with the requirements for border lights and proscenium sidelights in 520.44(A). The supply cable shall be protected by bushings where it passes through metal and shall be arranged so that tension on the cable will not be transmitted to the connections.

Informational Note No. 1: See 520.42 for wiring of portable strips.

Informational Note No. 2: See 520.68(A)(3) for insulation types required on single conductors.

### 520.65 Festoons

Joints in festoon wiring shall be staggered. Where such lampholders have terminals of a type that puncture the insulation and make contact with the conductors, they shall be attached only to conductors of the stranded type. Lamps enclosed in lanterns or similar devices of combustible material shall be equipped with guards.

Joints in festoon wiring must be staggered and properly insulated. This arrangement ensures that connections are not opposite one another, which could cause sparking due to improper insulation or unraveling of insulation, which, in turn, could ignite lanterns or other combustible material enclosing lamps. Where lampholders have terminals of a type that punctures the conductor insulation and makes contact with the conductors, stranded conductors should be used. (See the definition of *festoon lighting* in Article 100.)

### 520.66 Special Effects

Electrical devices used for simulating lightning, waterfalls, and the like shall be constructed and located so that flames, sparks, or hot particles cannot come in contact with combustible material.

### 520.67 Multipole Branch-Circuit Cable Connectors

Multipole branch-circuit cable connectors, male and female, for flexible conductors shall be constructed so that tension on the cord or cable is not transmitted to the connections. The female half shall be attached to the load end of the power supply cord or cable. The connector shall be rated in amperes and designed so that differently rated devices cannot be connected together; however, a 20-ampere T-slot receptacle shall be permitted to accept a 15-ampere attachment plug of the same voltage rating. Alternating-current multipole connectors shall be polarized and comply with 406.7 and 406.10.

Informational Note: See 400.10 for pull at terminals.

### 520.68 Conductors for Portables

#### (A) Conductor Type.

(1) **General.** Flexible conductors, including cable extensions, used to supply portable stage equipment shall be listed extra-hard usage cords or cables.

(2) **Stand Lamps.** Listed, hard usage cord shall be permitted to supply stand lamps where the cord is not subject to physical damage and is protected by an overcurrent device rated at not over 20 amperes.

See 520.2 for the definition of *stand lamp (work light)*.

(3) **High-Temperature Applications.** A special assembly of conductors in sleeving not longer than 1.0 m (3.3 ft) shall be permitted to be employed in lieu of flexible cord if the individual wires are stranded and rated not less than 125°C (257°F) and the outer sleeve is glass fiber with a wall thickness of at least 0.635 mm (0.025 in.).

Portable stage equipment requiring flexible supply conductors with a higher temperature rating where one end is permanently attached to the equipment shall be permitted to employ alternate, suitable conductors as determined by a qualified testing laboratory and recognized test standards.

This covers the connection of high-temperature equipment, including stage lighting fixtures, which often operate at elevated temperatures. High-temperature (150°C to 250°C), extra-hard-usage cords are, in general, not available. Less-than-extra-hard-usage cords are limited to 3.3 ft in length to reduce the likelihood that they would be placed on the floor or other area where they might be damaged by traffic or moving scenery.

(4) **Breakouts.** Listed, hard usage (junior hard service) cords shall be permitted in breakout assemblies where all of the following conditions are met:

- (1) The cords are utilized to connect between a single multipole connector containing two or more branch circuits and multiple 2-pole, 3-wire connectors.
- (2) The longest cord in the breakout assembly does not exceed 6.0 m (20 ft).
- (3) The breakout assembly is protected from physical damage by attachment over its entire length to a pipe, truss, tower, scaffold, or other substantial support structure.
- (4) All branch circuits feeding the breakout assembly are protected by overcurrent devices rated at not over 20 amperes.

These requirements apply to multiconductor cable assemblies with multipole connectors that contain more than one branch circuit. The breakout assembly is a multipole connector with several pendant receptacles connected to it, separating the multiple branch circuits into individual branch circuits. It is also possible to use a similar arrangement of pendant plugs to form a breaking assembly on the other end of the multiconductor cable.

(B) **Conductor Ampacity.** The ampacity of conductors shall be as given in 400.5, except multiconductor, listed, extra-hard usage portable cords that are not in direct contact with equipment containing heat-producing elements shall be permitted to have their ampacity determined by Table 520.44. Maximum load current in any conductor with an ampacity determined by Table 520.44 shall not exceed the values in Table 520.44.

Listed portable, multiconductor cable is permitted to be sized in accordance with Table 520.44, similar to the method used for border light cable. If the cable is located horizontally directly above heat-producing equipment, in lieu of a connector strip, it should be spaced sufficiently above that equipment to avoid the elevated temperatures or sized in accordance with 400.5.

*Exception: Where alternate conductors are allowed in 520.68(A)(3), their ampacity shall be as given in the appropriate table in this Code for the types of conductors employed.*

### 520.69 Adapters

Adapters, two-fers, and other single- and multiple-circuit outlet devices shall comply with 520.69(A), (B), and (C).

**(A) No Reduction in Current Rating.** Each receptacle and its corresponding cable shall have the same current and voltage rating as the plug supplying it. It shall not be utilized in a stage circuit with a greater current rating.

**(B) Connectors.** All connectors shall be wired in accordance with 520.67.

Plugs and receptacles must be of the same rating even though adapters are available, allowing cords and connector bodies of one ampacity to be connected to a plug of a larger rating. For example, a 12 AWG conductor with an ampacity of 20 amperes could be connected to a 100-ampere circuit. An overload could result in a fire because the circuit breaker or fuse would not provide adequate protection.

**(C) Conductor Type.** Conductors for adapters and two-fers shall be listed, extra-hard usage or listed, hard usage (junior hard service) cord. Hard usage (junior hard service) cord shall be restricted in overall length to 1.0 m (3.3 ft).

## VI. Dressing Rooms

### 520.71 Pendant Lampholders

Pendant lampholders shall not be installed in dressing rooms.

### 520.72 Lamp Guards

All exposed incandescent lamps in dressing rooms, where less than 2.5 m (8 ft) from the floor, shall be equipped with open-end guards riveted to the outlet box cover or otherwise sealed or locked in place.

Lamps in dressing rooms are required to be provided with suitable open-end guards that permit relamping and that are

not easily removed; thus making it difficult to circumvent the guard's intended purpose of preventing contact between the lamps and flammable materials, such as costumes and wigs, typically found in dressing rooms.

### 520.73 Switches Required

All lights and any receptacles adjacent to the mirror(s) and above the dressing table counter(s) installed in dressing rooms shall be controlled by wall switches installed in the dressing room(s). Each switch controlling receptacles adjacent to the mirror(s) and above the dressing table counter(s) shall be provided with a pilot light located outside the dressing room, adjacent to the door to indicate when the receptacles are energized. Other outlets installed in the dressing room shall not be required to be switched.

This addresses only receptacles located adjacent to the mirror and on the countertop. The receptacles located elsewhere in the room are not subject to the disconnect and pilot light requirements of 520.73. The purpose of the switching requirement is to ensure that all coffee pots, curling irons, hair dryers, and other similar countertop appliances can be readily disconnected at the end of a performance.

## VII. Grounding

### 520.81 Grounding

All metal raceways and metal-sheathed cables shall be connected to an equipment grounding conductor. The metal frames and enclosures of all equipment, including border lights and portable luminaires, shall be connected to an equipment grounding conductor.

## I. General

### 522.1 Scope

This article covers the installation of control circuit power sources and control circuit conductors for electrical equipment, including associated control wiring in or on all structures, that are an integral part of a permanent amusement attraction.

Article 522 provides requirements for permanent amusement attractions and theme parks. Article 525 applies only to temporary attractions, such as carnivals, circuses, and fairs, where most of the attractions consist of portable modules that are moved from place to place. In contrast, theme parks are permanent facilities that have entertainment features fixed in place so that they are not readily portable. In the United States, more than 450 theme parks operate a wide variety of permanent entertainment features, such as the one shown in Exhibit 522.1.

Article 522 addresses the unique applications and installations utilized in the theme park and amusement industry and covers the wiring requirements for the control circuit power source and control circuit conductors, allowing for wiring methods not available under the provisions of Article 725. The control voltage used is a maximum of 150 volts ac to ground or 300 volts dc to ground.

### 522.2 Definitions

**Control Circuit.** For the purposes of this article, the circuit of a control system that carries the electrical signals directing the performance of the controller but does not carry the main power current.

**EXHIBIT 522.1** An amusement park facility covered by the requirements of Article 522.

**Entertainment Device.** A mechanical or electromechanical device that provides an entertainment experience.

**Informational Note:** These devices may include animated props, show action equipment, animated figures, and special effects, coordinated with audio and lighting to provide an entertainment experience.

**Permanent Amusement Attraction.** Ride devices, entertainment devices, or combination thereof, that are installed so that portability or relocation is impracticable.

**Ride Device.** A device or combination of devices that carry, convey, or direct a person(s) over or through a fixed or restricted course within a defined area for the primary purpose of amusement or entertainment.

### 522.5 Voltage Limitations

Control voltage shall be a maximum of 150 volts, nominal, ac to ground or 300 volts dc to ground.

### 522.7 Maintenance

The conditions of maintenance and supervision shall ensure that only qualified persons service the permanent amusement attraction.

## II. Control Circuits

### 522.10 Power Sources for Control Circuits

**(A) Power-Limited Control Circuits.** Power-limited control circuits shall be supplied from a source that has a rated output of not more than 30 volts and 1000 volt-amperes.

**(1) Control Transformers.** Transformers used to supply power-limited control circuits shall comply with the applicable sections within Parts I and II of Article 450.

**(2) Other Power-Limited Control Power Sources.** Power-limited control power sources, other than transformers, shall be protected by overcurrent devices rated at not more than 167 percent of the volt-ampere rating of the source divided by the rated voltage. The fusible overcurrent devices shall not be interchangeable with fusible overcurrent devices of higher ratings. The overcurrent device shall be permitted to be an integral part of the power source.

To comply with the 1000 volt-ampere limitation of 522.10(A), the maximum output of power sources, other than transformers, shall be limited to 2500 volt-amperes, and the product of the maximum current and maximum voltage shall not exceed 10,000 volt-amperes. These ratings shall be determined with any overcurrent-protective device bypassed.

**(B) Non-Power-Limited Control Circuits.** Non-power-limited control circuits shall not exceed 300 volts. The power output of the source shall not be required to be limited.

**(1) Control Transformers.** Transformers used to supply non-power-limited control circuits shall comply with the applicable sections within Parts I and II of Article 450.

**(2) Other Non-Power-Limited Control Power Sources.** Non-power-limited control power sources, other than transformers, shall be protected by overcurrent devices rated at not more than 125 percent of the volt-ampere rating of the source divided by the rated voltage. The fusible overcurrent devices shall not be interchangeable with fusible overcurrent devices of higher ratings. The overcurrent device shall be permitted to be an integral part of the power source.

## III. Control Circuit Wiring Methods

### 522.20 Conductors, Busbars, and Slip Rings

Insulated control circuit conductors shall be copper and shall be permitted to be stranded or solid. Listed multiconductor cable assemblies shall be permitted.

*Exception No. 1: Busbars and slip rings shall be permitted to be materials other than copper.*

*Exception No. 2: Conductors used as specific-purpose devices, such as thermocouples and resistive thermal devices, shall be permitted to be materials other than copper.*

### 522.21 Conductor Sizing

**(A) Conductors Within a Listed Component or Assembly.** Conductors of size 30 AWG or larger shall be permitted within a listed component or as part of the wiring of a listed assembly.

**(B) Conductors Within an Enclosure or Operator Station.** Conductors of size 30 AWG or larger shall be permitted in a listed and jacketed multiconductor cable within an enclosure or operator station. Conductors in a non-jacketed multiconductor cable, such as ribbon cable, shall not be smaller than 26 AWG. Single conductors shall not be smaller than 24 AWG.

*Exception: Single conductors 30 AWG or larger shall be permitted for jumpers and special wiring applications.*

**(C) Conductors Outside of an Enclosure or Operator Station.** The size of conductors in a listed and jacketed, multiconductor cable shall not be smaller than 26 AWG. Single conductors shall not be smaller than 18 AWG and shall be installed only where part of a recognized wiring method of Chapter 3.

### 522.22 Conductor Ampacity

Conductors sized 16 AWG and smaller shall not exceed the continuous current values provided in Table 522.22.

### 522.23 Overcurrent Protection for Conductors

Conductors 30 AWG through 16 AWG shall have overcurrent protection in accordance with the appropriate conductor ampacity in Table 522.22. Conductors larger than 16 AWG shall have overcurrent protection in accordance with the appropriate conductor ampacity in Table 310.15(B)(16).

### 522.24 Conductors of Different Circuits in the Same Cable, Cable Tray, Enclosure, or Raceway

Control circuits shall be permitted to be installed with other circuits as specified in 522.24(A) and (B).

**(A) Two or More Control Circuits.** Control circuits shall be permitted to occupy the same cable, cable tray, enclosure, or raceway without regard to whether the individual circuits are alternating current or direct current, provided all conduc-

**TABLE 522.22 Conductor Ampacity Based on Copper Conductors with 60°C and 75°C Insulation in an Ambient Temperature of 30°C**

Conductor Size (AWG)	Ampacity	
	60°C	75°C
30	—	0.5
28	—	0.8
26	—	1
24	2	2
22	3	3
20	5	5
18	7	7
16	10	10

Notes:

1. For ambient temperatures other than 30°C, use Table 310.15(B)(16) temperature correction factors.
2. Ampacity adjustment for conductors with 90°C or greater insulation shall be based on ampacities in the 75°C column.

tors are insulated for the maximum voltage of any conductor in the cable, cable tray, enclosure, or raceway.

**(B) Control Circuits with Power Circuits.** Control circuits shall be permitted to be installed with power conductors as specified in 522.24(B)(1) through (B)(3).

**(1) In a Cable, Enclosure, or Raceway.** Control circuits and power circuits shall be permitted to occupy the same cable, enclosure, or raceway only where the equipment powered is functionally associated.

**(2) In Factory- or Field-Assembled Control Centers.** Control circuits and power circuits shall be permitted to be installed in factory- or field-assembled control centers.

**(3) In a Manhole.** Control circuits and power circuits shall be permitted to be installed as underground conductors in a manhole in accordance with one of the following:

- (1) The power or control circuit conductors are in a metal-enclosed cable or Type UF cable.
- (2) The conductors are permanently separated from the power conductors by a continuous firmly fixed nonconductor, such as flexible tubing, in addition to the insulation on the wire.
- (3) The conductors are permanently and effectively separated from the power conductors and securely fastened to racks, insulators, or other approved supports.
- (4) In cable trays, where the control circuit conductors and power conductors not functionally associated with them are separated by a solid fixed barrier of a material com-

patible with the cable tray, or where the power or control circuit conductors are in a metal-enclosed cable.

### 522.25 Ungrounded Control Circuits

Separately derived ac and 2-wire dc circuits and systems 50 volts or greater shall be permitted to be ungrounded, provided that all the following conditions are met:

- (1) Continuity of control power is required for orderly shut-down.
- (2) Ground detectors are installed on the control system.

### 522.28 Control Circuits in Wet Locations

Where wet contact is likely to occur, ungrounded 2-wire direct-current control circuits shall be limited to 30 volts maximum for continuous dc or 12.4 volts peak for direct current that is interrupted at a rate of 10 to 200 Hz.

## I. General Requirements

### 525.1 Scope

This article covers the installation of portable wiring and equipment for carnivals, circuses, fairs, and similar functions, including wiring in or on all structures.

Article 525 addresses the installation of portable wiring and equipment for temporary attractions, such as carnivals, circuses, and fairs. Article 525 is intended to apply to all wiring in or on portable structures, whereas Articles 518, 520, and 522 apply to permanent structures.

### 525.2 Definitions

**Operator.** The individual responsible for starting, stopping, and controlling an amusement ride or supervising a concession.

**Portable Structures.** Units designed to be moved including, but not limited to, amusement rides, attractions, concessions, tents, trailers, trucks, and similar units.

### 525.3 Other Articles

**(A) Portable Wiring and Equipment.** Wherever the requirements of other articles of this *Code* and Article 525 differ, the requirements of Article 525 shall apply to the portable wiring and equipment.

**(B) Permanent Structures.** Articles 518 and 520 shall apply to wiring in permanent structures.

**(C) Audio Signal Processing, Amplification, and Reproduction Equipment.** Article 640 shall apply to the wiring and installation of audio signal processing, amplification, and reproduction equipment.

**(D) Attractions Utilizing Pools, Fountains, and Similar Installations with Contained Volumes of Water.** This equipment shall be installed to comply with the applicable requirements of Article 680.

### 525.5 Overhead Conductor Clearances

**(A) Vertical Clearances.** Conductors shall have a vertical clearance to ground in accordance with 225.18. These clearances shall apply only to wiring installed outside of tents and concessions.

#### (B) Clearance to Portable Structures.

**(1) Under 600 Volts.** Portable structures shall be maintained not less than 4.5 m (15 ft) in any direction from overhead conductors operating at 600 volts or less, except for the conductors supplying the portable structure. Portable structures included in 525.3(D) shall comply with Table 680.8.

**(2) Over 600 Volts.** Portable structures shall not be located under or within a space that is located 4.5 m (15 ft) horizontally and extending vertically to grade of conductors operating in excess of 600 volts.

Portable structures, which include rides, attractions, and vendor booths, are not permitted in the area defined by a square that extends 15 ft horizontally from the overhead conductors and down to grade level. Exhibit 525.1 depicts the restricted area.

### 525.6 Protection of Electrical Equipment

Electrical equipment and wiring methods in or on portable structures shall be provided with mechanical protection where such equipment or wiring methods are subject to physical damage.

## II. Power Sources

Part II, Power Sources, provides some of the requirements for services and multiple sources of supply, such as generators and transformers, that are separately derived systems. In addition to the requirements in 525.10(A) and (B), the requirements for services in Article 230 are applicable.

Service equipment must be installed in accordance with Article 230 and must be lockable where accessible to unqualified persons. Fairs, carnivals, and similar events generate significant pedestrian traffic throughout the sites, including those

**EXHIBIT 525.1** An area restricted by 525.5(B)(2).

areas where electrical equipment is located. This requirement helps safeguard the general public from accidentally coming in contact with energized service equipment.

### 525.10 Services

Services shall comply with 525.10(A) and (B).

**(A) Guarding.** Service equipment shall not be installed in a location that is accessible to unqualified persons, unless the equipment is lockable.

**(B) Mounting and Location.** Service equipment shall be securely fastened to a solid backing and be installed so as to be protected from the weather, unless of weatherproof construction.

### 525.11 Multiple Sources of Supply

Where multiple services or separately derived systems, or both, supply portable structures, the equipment grounding conductors of all the sources of supply that serve such structures separated by less than 3.7 m (12 ft) shall be bonded together at the portable structures. The bonding conductor shall be copper and sized in accordance with Table 250.122 based on the largest overcurrent device supplying the portable structures, but not smaller than 6 AWG.

To maintain an equal potential between exposed, non-current-carrying metal parts of portable structures that have a physical separation less than 12 ft, they must be bonded to each other using a copper conductor sized per Table 250.122, but not smaller than 6 AWG.

## III. Wiring Methods

### 525.20 Wiring Methods

**(A) Type.** Where flexible cords or cables are used, they shall be listed for extra-hard usage. Where flexible cords or cables are used and are not subject to physical damage, they shall be permitted to be listed for hard usage. Where used outdoors, flexible cords and cables shall also be listed for wet locations and shall be sunlight resistant. Extra-hard usage flexible cords or cables shall be permitted for use as permanent wiring on portable amusement rides and attractions where not subject to physical damage.

**(B) Single-Conductor.** Single-conductor cable shall be permitted only in sizes 2 AWG or larger.

**(C) Open Conductors.** Open conductors are prohibited except as part of a listed assembly or festoon lighting installed in accordance with Article 225.

**(D) Splices.** Flexible cords or cables shall be continuous without splice or tap between boxes or fittings.

**(E) Cord Connectors.** Cord connectors shall not be laid on the ground unless listed for wet locations. Connectors and cable connections shall not be placed in audience traffic paths or within areas accessible to the public unless guarded.

**(F) Support.** Wiring for an amusement ride, attraction, tent, or similar structure shall not be supported by any other ride or structure unless specifically designed for the purpose.

**(G) Protection.** Flexible cords or cables accessible to the public shall be arranged to minimize the tripping hazard and shall be permitted to be covered with nonconductive matting, provided that the matting does not constitute a greater tripping hazard than the uncovered cables. It shall be permitted to bury cables. The requirements of 300.5 shall not apply.

**(H) Boxes and Fittings.** A box or fitting shall be installed at each connection point, outlet, switchpoint, or junction point.

### 525.21 Rides, Tents, and Concessions

**(A) Disconnecting Means.** A means to disconnect each portable structure from all ungrounded conductors shall be provided. The disconnecting means shall be located within sight

of and within 1.8 m (6 ft) of the operator's station. The disconnecting means shall be readily accessible to the operator, including when the ride is in operation. Where accessible to unqualified persons, the disconnecting means shall be lockable. A shunt trip device that opens the fused disconnect or circuit breaker when a switch located in the ride operator's console is closed shall be a permissible method of opening the circuit.

**(B) Portable Wiring Inside Tents and Concessions.** Electrical wiring for lighting, where installed inside of tents and concessions, shall be securely installed and, where subject to physical damage, shall be provided with mechanical protection. All lamps for general illumination shall be protected from accidental breakage by a suitable luminaire or lamp-holder with a guard.

### 525.22 Portable Distribution or Termination Boxes

Portable distribution or termination boxes shall comply with 525.22(A) through (D).

**(A) Construction.** Boxes shall be designed so that no live parts are exposed except when necessary for examination, adjustment, servicing, or maintenance by qualified persons. Where installed outdoors, the box shall be of weatherproof construction and mounted so that the bottom of the enclosure is not less than 150 mm (6 in.) above the ground.

Requiring portable distribution or termination equipment to be mounted so that the bottom of the enclosure is at least 6 in. above the ground prevents excessive moisture from entering the equipment and allows for proper radius of bend on conductors entering and exiting the equipment from below.

**(B) Busbars and Terminals.** Busbars shall have an ampere rating not less than the overcurrent device supplying the feeder supplying the box. Where conductors terminate directly on busbars, busbar connectors shall be provided.

**(C) Receptacles and Overcurrent Protection.** Receptacles shall have overcurrent protection installed within the box. The overcurrent protection shall not exceed the ampere rating of the receptacle, except as permitted in Article 430 for motor loads.

**(D) Single-Pole Connectors.** Where single-pole connectors are used, they shall comply with 530.22.

### 525.23 Ground-Fault Circuit-Interrupter (GFCI) Protection

**(A) Where GFCI Protection Is Required.** GFCI protection for personnel shall be provided for the following:

- (1) All 125-volt, single-phase, 15- and 20-ampere non-locking-type receptacles used for disassembly and reassembly or readily accessible to the general public
- (2) Equipment that is readily accessible to the general public and supplied from a 125-volt, single-phase, 15- or 20-ampere branch circuit

The ground-fault circuit-interrupter shall be permitted to be an integral part of the attachment plug or located in the power-supply cord within 300 mm (12 in.) of the attachment plug. Listed cord sets incorporating ground-fault circuit-interrupter for personnel shall be permitted.

**(B) Where GFCI Protection Is Not Required.** Receptacles that are not accessible from grade level and that only facilitate quick disconnecting and reconnecting of electrical equipment shall not be required to be provided with GFCI protection. These receptacles shall be of the locking type.

**(C) Where GFCI Protection Is Not Permitted.** Egress lighting shall not be protected by a GFCI.

Section 525.23 provides three categories: where GFCIs are required, where GFCIs are not required, and where GFCIs are not permitted to be installed. The application where GFCI protection is not required is very specific. The receptacles must be locking, quick disconnect/reconnect and must not be accessible from grade. GFCI protection is not allowed on circuits that supply means-of-egress illumination.

## IV. Grounding and Bonding

### 525.30 Equipment Bonding

The following equipment connected to the same source shall be bonded:

- (1) Metal raceways and metal-sheathed cable
- (2) Metal enclosures of electrical equipment
- (3) Metal frames and metal parts of portable structures, trailers, trucks, or other equipment that contain or support electrical equipment

The equipment grounding conductor of the circuit supplying the equipment in items (1), (2) or (3) that is likely to energize the metal frame or part shall be permitted to serve as the bonding means.

### 525.31 Equipment Grounding

All equipment to be grounded shall be connected to an equipment grounding conductor of a type recognized by 250.118 and installed in accordance with Parts VI and VII of Article 250. The equipment grounding conductor shall be

connected to the system grounded conductor at the service disconnecting means or, in the case of a separately derived system such as a generator, at the generator or first disconnecting means supplied by the generator. The grounded circuit conductor shall not be connected to the equipment grounding conductor on the load side of the service disconnecting means or on the load side of a separately derived system disconnecting means.

### 525.32 Grounding Conductor Continuity

#### Assurance

The continuity of the grounding conductor system used to reduce electrical shock hazards as required by 250.114, 250.138, 406.4(C), and 590.4(D) shall be verified each time that portable electrical equipment is connected.

The transient nature of the events covered under Article 525 and, in some cases, the entire associated electrical distribution system increase the possibility that continuity of the equipment grounding conductor system could be interrupted. Verification of the grounding system continuity each time equipment is reconnected helps ensure the safety of workers and members of the general public who may come in contact with electrical equipment.

## I. General

### 530.1 Scope

The requirements of this article shall apply to television studios and motion picture studios using either film or electronic cameras, except as provided in 520.1, and exchanges, factories, laboratories, stages, or a portion of the building in which film or tape more than 22 mm (7/8 in.) in width is exposed, developed, printed, cut, edited, rewound, repaired, or stored.

Informational Note: For methods of protecting against cellulose nitrate film hazards, see NFPA 40-2011, *Standard for the Storage and Handling of Cellulose Nitrate Film*.

The requirements for motion picture studios and for television studios are virtually the same and are intended to apply only to those locations presenting special hazards, that is, where film is handled or for temporary structures constructed of wood or other combustible material. In other areas of the facilities, the conditions are similar to those for theater stages, and the provisions of Article 520 apply for such areas as stages and dressing rooms.

## 530.2 Definitions

**Alternating-Current Power Distribution Box (Alternating-Current Plugging Box, Scatter Box).** An ac distribution center or box that contains one or more grounding-type polarized receptacles that may contain overcurrent protective devices.

**Bull Switch.** An externally operated wall-mounted safety switch that may or may not contain overcurrent protection and is designed for the connection of portable cables and cords.

**Location (Shooting Location).** A place outside a motion picture studio where a production or part of it is filmed or recorded.

**Location Board (Deuce Board).** Portable equipment containing a lighting contactor or contactors and overcurrent protection designed for remote control of stage lighting.

**Motion Picture Studio (Lot).** A building or group of buildings and other structures designed, constructed, or permanently altered for use by the entertainment industry for the purpose of motion picture or television production.

**Plugging Box.** A dc device consisting of one or more 2-pole, 2-wire, nonpolarized, nongrounding-type receptacles intended to be used on dc circuits only.

**Portable Equipment.** Equipment intended to be moved from one place to another.

**Single-Pole Separable Connector.** A device that is installed at the ends of portable, flexible, single-conductor cable that is used to establish connection or disconnection between two cables or one cable and a single-pole, panel-mounted separable connector.

**Spider (Cable Splicing Block).** A device that contains busbars that are insulated from each other for the purpose of splicing or distributing power to portable cables and cords that are terminated with single-pole busbar connectors.

**Stage Effect (Special Effect).** An electrical or electromechanical piece of equipment used to simulate a distinctive

visual or audible effect such as wind machines, lightning simulators, sunset projectors, and the like.

**Stage Property.** An article or object used as a visual element in a motion picture or television production, except painted backgrounds (scenery) and costumes.

**Stage Set.** A specific area set up with temporary scenery and properties designed and arranged for a particular scene in a motion picture or television production.

**Stand Lamp (Work Light).** A portable stand that contains a general-purpose luminaire or lampholder with guard for the purpose of providing general illumination in the studio or stage.

**Television Studio or Motion Picture Stage (Sound Stage).** A building or portion of a building usually insulated from the outside noise and natural light for use by the entertainment industry for the purpose of motion picture, television, or commercial production.

## 530.6 Portable Equipment

Portable stage and studio lighting equipment and portable power distribution equipment shall be permitted for temporary use outdoors if the equipment is supervised by qualified personnel while energized and barriered from the general public.

See the commentary following 520.10 for more information on portable equipment.

## II. Stage or Set

### 530.11 Permanent Wiring

The permanent wiring shall be Type MC cable, Type AC cable containing an insulated equipment grounding conductor sized in accordance with Table 250.122, Type MI cable, or in approved raceways.

*Exception: Communications circuits; audio signal processing, amplification, and reproduction circuits; Class 1, Class 2, and Class 3 remote-control or signaling circuits and power-limited fire alarm circuits shall be permitted to be wired in accordance with Articles 640, 725, 760, and 800.*

### 530.12 Portable Wiring

**(A) Stage Set Wiring.** The wiring for stage set lighting and other supply wiring not fixed as to location shall be done with listed hard usage flexible cords and cables. Where subject to physical damage, such wiring shall be listed extra-hard usage flexible cords and cables. Splices or taps in cables shall be permitted if the total connected load does not exceed the maximum ampacity of the cable.

**(B) Stage Effects and Electrical Equipment Used as Stage Properties.** The wiring for stage effects and electrical equipment used as stage properties shall be permitted to be wired with single- or multiconductor listed flexible cords or cables if the conductors are protected from physical damage and secured to the scenery by approved cable ties or by insulated staples. Splices or taps shall be permitted where such are made with listed devices and the circuit is protected at not more than 20 amperes.

**(C) Other Electrical Equipment.** Cords and cables other than extra-hard usage, where supplied as a part of a listed assembly, shall be permitted.

### 530.13 Stage Lighting and Effects Control

Switches used for studio stage set lighting and effects (on the stages and lots and on location) shall be of the externally operable type. Where contactors are used as the disconnecting means for fuses, an individual externally operable switch, suitably rated, for the control of each contactor shall be located at a distance of not more than 1.8 m (6 ft) from the contactor, in addition to remote-control switches. A single externally operable switch shall be permitted to simultaneously disconnect all the contactors on any one location board, where located at a distance of not more than 1.8 m (6 ft) from the location board.

### 530.14 Plugging Boxes

Each receptacle of dc plugging boxes shall be rated at not less than 30 amperes.

### 530.15 Enclosing and Guarding Live Parts

**(A) Live Parts.** Live parts shall be enclosed or guarded to prevent accidental contact by persons and objects.

**(B) Switches.** All switches shall be of the externally operable type.

**(C) Rheostats.** Rheostats shall be placed in approved cases or cabinets that enclose all live parts, having only the operating handles exposed.

**(D) Current-Carrying Parts.** Current-carrying parts of bull switches, location boards, spiders, and plugging boxes shall be enclosed, guarded, or located so that persons cannot accidentally come into contact with them or bring conductive material into contact with them.

### 530.16 Portable Luminaires

Portable luminaires and work lights shall be equipped with flexible cords, composition or metal-sheathed porcelain sockets, and substantial guards.

*Exception: Portable luminaires used as properties in a motion picture set or television stage set, on a studio stage or lot, or on location shall not be considered to be portable luminaires for the purpose of this section.*

### 530.17 Portable Arc Lamps

**(A) Portable Carbon Arc Lamps.** Portable carbon arc lamps shall be substantially constructed. The arc shall be provided with an enclosure designed to retain sparks and carbons and to prevent persons or materials from coming into contact with the arc or bare live parts. The enclosures shall be ventilated. All switches shall be of the externally operable type.

**(B) Portable Noncarbon Arc Electric-Discharge Lamps.** Portable noncarbon arc lamps, including enclosed arc lamps, and associated ballasts shall be listed. Interconnecting cord sets and interconnecting cords and cables shall be extra-hard usage type and listed.

### 530.18 Overcurrent Protection — General

Automatic overcurrent protective devices (circuit breakers or fuses) for motion picture studio stage set lighting and the stage cables for such stage set lighting shall be as given in 530.18(A) through (G). The maximum ampacity allowed on a given conductor, cable, or cord size shall be as given in the applicable tables of Articles 310 and 400.

**(A) Stage Cables.** Stage cables for stage set lighting shall be protected by means of overcurrent devices set at not more than 400 percent of the ampacity given in the applicable tables of Articles 310 and 400.

**(B) Feeders.** In buildings used primarily for motion picture production, the feeders from the substations to the stages shall be protected by means of overcurrent devices (generally located in the substation) having a suitable ampere rating. The overcurrent devices shall be permitted to be multipole or single-pole gang operated. No pole shall be required in the neutral conductor. The overcurrent device setting for each feeder shall not exceed 400 percent of the ampacity of the feeder, as given in the applicable tables of Article 310.

**(C) Cable Protection.** Cables shall be protected by bushings where they pass through enclosures and shall be arranged so that tension on the cable is not transmitted to the connections. Where power conductors pass through metal, the requirements of 300.20 shall apply.

Portable feeder cables shall be permitted to temporarily penetrate fire-rated walls, floors, or ceilings provided that all of the following apply:

- (1) The opening is of noncombustible material.
- (2) When in use, the penetration is sealed with a temporary seal of a listed firestop material.

- (3) When not in use, the opening shall be capped with a material of equivalent fire rating.

**(D) Location Boards.** Overcurrent protection (fuses or circuit breakers) shall be provided at the location boards. Fuses in the location boards shall have an ampere rating of not over 400 percent of the ampacity of the cables between the location boards and the plugging boxes.

**(E) Plugging Boxes.** Cables and cords supplied through plugging boxes shall be of copper. Cables and cords smaller than 8 AWG shall be attached to the plugging box by means of a plug containing two cartridge fuses or a 2-pole circuit breaker. The rating of the fuses or the setting of the circuit breaker shall not be over 400 percent of the rated ampacity of the cables or cords as given in the applicable tables of Articles 310 and 400. Plugging boxes shall not be permitted on ac systems.

**(F) Alternating-Current Power Distribution Boxes.** Alternating-current power distribution boxes used on sound stages and shooting locations shall contain connection receptacles of a polarized, grounding type.

**(G) Lighting.** Work lights, stand lamps, and luminaires rated 1000 watts or less and connected to dc plugging boxes shall be by means of plugs containing two cartridge fuses not larger than 20 amperes, or they shall be permitted to be connected to special outlets on circuits protected by fuses or circuit breakers rated at not over 20 amperes. Plug fuses shall not be used unless they are on the load side of the fuse or circuit breakers on the location boards.

### 530.19 Sizing of Feeder Conductors for Television Studio Sets

**(A) General.** It shall be permissible to apply the demand factors listed in Table 530.19(A) to that portion of the maximum possible connected load for studio or stage set lighting for all permanently installed feeders between substations and stages and to all permanently installed feeders between the main stage switchboard and stage distribution centers or location boards.

**TABLE 530.19(A) Demand Factors for Stage Set Lighting**

Portion of Stage Set Lighting Load to Which Demand Factor Applied (volt-amperes)	Feeder Demand Factor (%)
First 50,000 or less at	100
From 50,001 to 100,000 at	75
From 100,001 to 200,000 at	60
Remaining over 200,000 at	50

**(B) Portable Feeders.** A demand factor of 50 percent of maximum possible connected load shall be permitted for all portable feeders.

### 530.20 Grounding

Type MC cable, Type MI cable, Type AC cable containing an insulated equipment grounding conductor, metal raceways, and all non-current-carrying metal parts of appliances, devices, and equipment shall be connected to an equipment grounding conductor. This shall not apply to pendant and portable lamps, to portable stage lighting and stage sound equipment, or to other portable and special stage equipment operating at not over 150 volts dc to ground.

### 530.21 Plugs and Receptacles

**(A) Rating.** Plugs and receptacles, including cord connectors and flanged surface devices, shall be rated in amperes. The voltage rating of the plugs and receptacles shall be not less than the nominal circuit voltage. Plug and receptacle ampere ratings for ac circuits shall not be less than the feeder or branch-circuit overcurrent device ampere rating. Table 210.21(B)(2) shall not apply.

**(B) Interchangeability.** Plugs and receptacles used in portable professional motion picture and television equipment shall be permitted to be interchangeable for ac or dc use on the same premises, provided they are listed for ac/dc use and marked in a suitable manner to identify the system to which they are connected.

### 530.22 Single-Pole Separable Connectors

**(A) General.** Where ac single-pole portable cable connectors are used, they shall be listed and of the locking type. Sections 400.10, 406.7, and 406.8 shall not apply to listed single-pole separable connections and single-conductor cable assemblies utilizing listed single-pole separable connectors. Where paralleled sets of current-carrying single-pole separable connectors are provided as input devices, they shall be prominently labeled with a warning indicating the presence of internal parallel connections. The use of single-pole separable connectors shall comply with at least one of the following conditions:

- Connection and disconnection of connectors are only possible where the supply connectors are interlocked to the source and it is not possible to connect or disconnect connectors when the supply is energized.
- Line connectors are of the listed sequential-interlocking type so that load connectors shall be connected in the following sequence:
  - Equipment grounding conductor connection
  - Grounded circuit conductor connection, if provided
  - Ungrounded conductor connection, and that disconnection shall be in the reverse order

(3) A caution notice shall be provided adjacent to the line connectors, indicating that plug connection shall be in the following order:

- a. Equipment grounding conductor connectors
- b. Grounded circuit-conductor connectors, if provided
- c. Ungrounded conductor connectors, and that disconnection shall be in the reverse order

**(B) Interchangeability.** Single-pole separable connectors used in portable professional motion picture and television equipment shall be permitted to be interchangeable for ac or dc use or for different current ratings on the same premises, provided they are listed for ac/dc use and marked in a suitable manner to identify the system to which they are connected.

### 530.23 Branch Circuits

A branch circuit of any size supplying one or more receptacles shall be permitted to supply stage set lighting loads.

## III. Dressing Rooms

### 530.31 Dressing Rooms

Fixed wiring in dressing rooms shall be installed in accordance with the wiring methods covered in Chapter 3. Wiring for portable dressing rooms shall be approved.

## IV. Viewing, Cutting, and Patching Tables

### 530.41 Lamps at Tables

Only composition or metal-sheathed, porcelain, keyless lampholders equipped with suitable means to guard lamps from physical damage and from film and film scrap shall be used at patching, viewing, and cutting tables.

## V. Cellulose Nitrate Film Storage Vaults

### 530.51 Lamps in Cellulose Nitrate Film Storage Vaults

Lamps in cellulose nitrate film storage vaults shall be installed in rigid **luminaires** of the glass-enclosed and gasketed type. Lamps shall be controlled by a switch having a pole in each ungrounded conductor. This switch shall be located outside of the vault and provided with a pilot light to indicate whether the switch is on or off. This switch shall disconnect from all sources of supply all ungrounded conductors terminating in any outlet in the vault.

### 530.52 Electrical Equipment in Cellulose Nitrate Film Storage Vaults

Except as permitted in 530.51, no receptacles, outlets, heaters, portable lights, or other portable electrical equipment shall be located in cellulose nitrate film storage vaults. Electric motors

shall be permitted, provided they are listed for the application and comply with Article 500, Class I, Division 2.

## VI. Substations

### 530.61 Substations

Wiring and equipment of over 600 volts, nominal, shall comply with Article 490.

### 530.62 Portable Substations

Wiring and equipment in portable substations shall conform to the sections applying to installations in permanently fixed substations, but, due to the limited space available, the working spaces shall be permitted to be reduced, provided that the equipment shall be arranged so that the operator can work safely and so that other persons in the vicinity cannot accidentally come into contact with current-carrying parts or bring conducting objects into contact with them while they are energized.

### 530.63 Overcurrent Protection of Direct-Current Generators

Three-wire generators shall have overcurrent protection in accordance with 445.12(E).

### 530.64 Direct-Current Switchboards

**(A) General.** Switchboards of not over 250 volts dc between conductors, where located in substations or switchboard rooms accessible to qualified persons only, shall not be required to be dead-front.

**(B) Circuit Breaker Frames.** Frames of dc circuit breakers installed on switchboards shall not be required to be connected to an equipment grounding conductor.

### IV. Audio Signal Processing, Amplification, and Reproduction Equipment

540.50 Audio Signal Processing, Amplification, and Reproduction Equipment

## I. General

### 540.1 Scope

The provisions of this article apply to motion picture projection rooms, motion picture projectors, and associated equipment of the professional and nonprofessional types using incandescent, carbon arc, xenon, or other light source equipment that develops hazardous gases, dust, or radiation.

**Informational Note:** For further information, see NFPA 40-2011, *Standard for the Storage and Handling of Cellulose Nitrate Film*.

Hazardous locations, as defined in Article 500, do not include motion picture projection rooms, even though some of the older types of film, such as cellulose nitrate film (rarely used now), are highly flammable. Cellulose acetate film, called safety film, is in wide use today. Because film is not volatile at ordinary temperatures and no flammable gases are present, the wiring installation is not required to be suitable for hazardous locations, as defined in Article 500, but should be installed with special care to protect against the hazards of fire.

### 540.2 Definitions

**Nonprofessional Projector.** Nonprofessional projectors are those types other than as described in 540.2.

**Professional Projector.** A type of projector using 35- or 70-mm film that has a minimum width of 35 mm (1⅜ in.) and has on each edge 212 perforations per meter (5.4 perforations per inch), or a type using carbon arc, xenon, or other light source equipment that develops hazardous gases, dust, or radiation.

## II. Equipment and Projectors of the Professional Type

### 540.10 Motion Picture Projection Room Required

Every professional-type projector shall be located within a projection room. Every projection room shall be of permanent construction, approved for the type of building in which the projection room is located. All projection ports, spotlight ports, viewing ports, and similar openings shall be provided with glass or other approved material so as to completely close the opening. Such rooms shall not be considered as hazardous (classified) locations as defined in Article 500.

Informational Note: For further information on protecting openings in projection rooms handling cellulose nitrate motion picture film, see NFPA 101-2009, *Life Safety Code*.

The audience area of a motion picture theater is covered by Article 520. Article 540 addresses the projection room for the theater. Every professional projector is required to be located within a permanent projection room, which is closed from the theater by glass or other material over all projection, spotlight, viewing, or other ports. Modern projectors contain rectifiers as an integral part of their equipment, thereby eliminating generators and other associated equipment described in 540.11. In accordance with 540.31, nonprofessional projectors are not required to be installed within a projection room.

### 540.11 Location of Associated Electrical Equipment

**(A) Motor Generator Sets, Transformers, Rectifiers, Rheostats, and Similar Equipment.** Motor-generator sets, transformers, rectifiers, rheostats, and similar equipment for the supply or control of current to projection or spotlight equipment shall, where nitrate film is used, be located in a separate room. Where placed in the projection room, they shall be located or guarded so that arcs or sparks cannot come in contact with film, and the commutator end or ends of motor generator sets shall comply with one of the conditions in 540.11(A)(1) through (A)(6).

**(1) Types.** Be of the totally enclosed, enclosed fan-cooled, or enclosed pipe-ventilated type.

**(2) Separate Rooms or Housings.** Be enclosed in separate rooms or housings built of noncombustible material constructed so as to exclude flyings or lint **with approved ventilation** from a source of clean air.

**(3) Solid Metal Covers.** Have the brush or sliding-contact end of motor-generator enclosed by solid metal covers.

**(4) Tight Metal Housings.** Have brushes or sliding contacts enclosed in substantial, tight metal housings.

**(5) Upper and Lower Half Enclosures.** Have the upper half of the brush or sliding-contact end of the motor-generator enclosed by a wire screen or perforated metal and the lower half enclosed by solid metal covers.

**(6) Wire Screens or Perforated Metal.** Have wire screens or perforated metal placed at the commutator of brush ends. No dimension of any opening in the wire screen or perforated metal shall exceed 1.27 mm (0.05 in.), regardless of the shape of the opening and of the material used.

**(B) Switches, Overcurrent Devices, or Other Equipment.** Switches, overcurrent devices, or other equipment not normally required or used for projectors, sound reproduction, flood or other special effect lamps, or other equipment shall not be installed in projection rooms.

*Exception No. 1: In projection rooms approved for use only with cellulose acetate (safety) film, the installation of ap-purtenant electrical equipment used in conjunction with the operation of the projection equipment and the control of lights, curtains, and audio equipment, and so forth, shall be permitted. In such projection rooms, a sign reading "Safety Film Only Permitted in This Room" shall be posted on the outside of each projection room door and within the projection room itself in a conspicuous location.*

*Exception No. 2: Remote-control switches for the control of auditorium lights or switches for the control of motors operating curtains and masking of the motion picture screen shall be permitted to be installed in projection rooms.*

**(C) Emergency Systems.** Control of emergency systems shall comply with Article 700.

#### 540.12 Work Space

Each motion picture projector, floodlight, spotlight, or similar equipment shall have clear working space not less than 750 mm (30 in.) wide on each side and at the rear thereof.

*Exception: One such space shall be permitted between adjacent pieces of equipment.*

#### 540.13 Conductor Size

Conductors supplying outlets for arc and xenon projectors of the professional type shall not be smaller than 8 AWG and shall have an ampacity not less than the projector current rating. Conductors for incandescent-type projectors shall conform to normal wiring standards as provided in 210.24.

#### 540.14 Conductors on Lamps and Hot Equipment

Insulated conductors having a rated operating temperature of not less than 200°C (392°F) shall be used on all lamps or other equipment where the ambient temperature at the conductors as installed will exceed 50°C (122°F).

#### 540.15 Flexible Cords

Cords approved for hard usage, as provided in Table 400.4, shall be used on portable equipment.

#### 540.20 Listing Requirements

Projectors and enclosures for arc, xenon, and incandescent lamps and rectifiers, transformers, rheostats, and similar equipment shall be listed.

#### 540.21 Marking

Projectors and other equipment shall be marked with the manufacturer's name or trademark and with the voltage and current for which they are designed in accordance with 110.21.

### III. Nonprofessional Projectors

#### 540.31 Motion Picture Projection Room Not Required

Projectors of the nonprofessional or miniature type, where employing cellulose acetate (safety) film, shall be permitted to be operated without a projection room.

#### 540.32 Listing Requirements

Projection equipment shall be listed.

### IV. Audio Signal Processing, Amplification, and Reproduction Equipment

#### 540.50 Audio Signal Processing, Amplification, and Reproduction Equipment

Audio signal processing, amplification, and reproduction equipment shall be installed as provided in Article 640.

545.13	Component Interconnections

### 545.1 Scope

This article covers requirements for a manufactured building and building components as herein defined.

The term *manufactured building* is defined in 545.2. With respect to this construction method for dwelling units, the distinction between manufactured buildings covered in Article 545 and manufactured homes as covered and defined in Article 550 is important. The most distinguishing feature between the two types of structures is how they are placed on the building site. Manufactured homes are built on a chassis and installed on site with or without a permanent foundation. Manufactured buildings are generally constructed within a factory or assembly plant and then transported to the building site. They are not built on a chassis and are designed to be installed on a permanent foundation.

In addition, the organizations responsible for construction standards for these units differ. In the case of manufactured homes, the U.S. Department of Housing and Urban Development, 24 CFR 3280, *Manufactured Home Construction and Safety Standards*, contains construction requirements for manufactured homes. Manufactured homes bear a nameplate documenting that the unit was constructed in accordance with the federal standard. In accordance with federal law, this identifying mark is universally recognized throughout the United States.

Manufactured building construction standards generally are promulgated through state or local units of government and typically have an information sheet (often inside the cabinet below the kitchen sink) indicating the applicable building, electrical, plumbing, and mechanical codes to which the building was constructed. Manufactured building construction can be directly affected by differences in building construction regulations among those jurisdictions responsible for regulating this type of construction.

### 545.2 Definitions

**Building Component.** Any subsystem, subassembly, or other system designed for use in or integral with or as part of a structure, which can include structural, electrical, mechanical, plumbing, and fire protection systems, and other systems affecting health and safety.

**Building System.** Plans, specifications, and documentation for a system of manufactured building or for a type or a system of building components, which can include structural, electrical, mechanical, plumbing, and fire protection systems, and other systems affecting health and safety, and including such variations thereof as are specifically permitted by regulation, and which variations are submitted as part of the building system or amendment thereto.

**Closed Construction.** Any building, building component, assembly, or system manufactured in such a manner that all concealed parts of processes of manufacture cannot be inspected **after** installation at the building site without disassembly, damage, or destruction.

**Manufactured Building.** Any building that is of closed construction and is made or assembled in manufacturing facilities on or off the building site for installation, or for assembly and installation on the building site, other than manufactured homes, mobile homes, park trailers, or recreational vehicles.

### 545.4 Wiring Methods

**(A) Methods Permitted.** All raceway and cable wiring methods included in this *Code* and such other wiring systems specifically intended and listed for use in manufactured buildings shall be permitted with listed fittings and with fittings listed and identified for manufactured buildings.

**(B) Securing Cables.** In closed construction, cables shall be permitted to be secured only at cabinets, boxes, or fittings where 10 AWG or smaller conductors are used and protection against physical damage is provided.

### 545.5 Supply Conductors

Provisions shall be made to route the service-entrance, service-lateral, feeder, or branch-circuit supply to the service or building disconnecting means conductors.

### 545.6 Installation of Service-Entrance Conductors

Service-entrance conductors shall be installed after erection at the building site.

*Exception: Where point of attachment is known prior to manufacture.*

### 545.7 Service Equipment

Service equipment shall be installed in accordance with 230.70.

### 545.8 Protection of Conductors and Equipment

Protection shall be provided for exposed conductors and equipment during processes of manufacturing, packaging, in transit, and erection at the building site.

### 545.9 Boxes

**(A) Other Dimensions.** Boxes of dimensions other than those required in Table 314.16(A) shall be permitted to be

installed where tested, identified, and listed to applicable standards.

**(B) Not Over 1650 cm<sup>3</sup> (100 in.<sup>3</sup>).** Any box not over 1650 cm<sup>3</sup> (100 in.<sup>3</sup>) in size, intended for mounting in closed construction, shall be affixed with anchors or clamps so as to provide a rigid and secure installation.

#### 545.10 Receptacle or Switch with Integral Enclosure

A receptacle or switch with integral enclosure and mounting means, where tested, identified, and listed to applicable standards, shall be permitted to be installed.

See the commentary following 300.15(E) for additional discussion about wiring devices with integral enclosures.

#### 545.11 Bonding and Grounding

Prewired panels and building components shall provide for the bonding, or bonding and grounding, of all exposed metals likely to become energized, in accordance with Article 250, Parts V, VI, and VII.

#### 545.12 Grounding Electrode Conductor

Provisions shall be made to route a grounding electrode conductor from the service, feeder, or branch-circuit supply to the point of attachment to the grounding electrode.

#### 545.13 Component Interconnections

Fittings and connectors that are intended to be concealed at the time of on-site assembly, where tested, identified, and listed to applicable standards, shall be permitted for on-site interconnection of modules or other building components. Such fittings and connectors shall be equal to the wiring method employed in insulation, temperature rise, and fault-current withstand and shall be capable of enduring the vibration and minor relative motions occurring in the components of manufactured buildings.

The structural components or modules are usually constructed in manufacturing facilities and then transported over the road to a building site for complete assembly of a structure, such as a dwelling unit, motel, or office building. Each module may be prewired at the factory and supplied with fittings and connectors. At the on-site location, these connectors are used to interconnect two or more modules.

### 547.1 Scope

The provisions of this article shall apply to the following agricultural buildings or that part of a building or adjacent areas of similar or like nature as specified in 547.1(A) or (B).

**(A) Excessive Dust and Dust with Water.** Agricultural buildings where excessive dust and dust with water may accumulate, including all areas of poultry, livestock, and fish confinement systems, where litter dust or feed dust, including mineral feed particles, may accumulate.

**(B) Corrosive Atmosphere.** Agricultural buildings where a corrosive atmosphere exists. Such buildings include areas where the following conditions exist:

- (1) Poultry and animal excrement may cause corrosive vapors.
- (2) Corrosive particles may combine with water.
- (3) The area is damp and wet by reason of periodic washing for cleaning and sanitizing with water and cleansing agents.
- (4) Similar conditions exist.

Article 547 applies not only to agricultural buildings but also to adjacent areas of similar or like nature. The requirements in Article 547 address the severe environmental conditions that regularly exist on agricultural premises. Damp and wet conditions, dust from feed and litter, and corrosive agents from livestock excrement are all present in these settings as part of normal operating conditions. Grounding and bonding requirements unique to agricultural settings are necessary due to the sensitivity of livestock to differences in potential between surfaces with which they are in direct contact. The wet or damp concrete common to animal confinement areas enhances this sensitivity.

## 547.2 Definitions

**Distribution Point.** An electrical supply point from which service drops, service conductors, feeders, or branch circuits to buildings or structures utilized under single management are supplied.

Informational Note No. 1: Distribution points are also known as the center yard pole, meterpole, or the common distribution point.

Informational Note No. 2: The service point as defined in Article 100 is typically at the distribution point.

**Equipotential Plane.** An area where wire mesh or other conductive elements are embedded in or placed under concrete, bonded to all metal structures and fixed nonelectrical equipment that may become energized, and connected to the electrical grounding system to prevent a difference in voltage from developing within the plane.

**Site-Isolating Device.** A disconnecting means installed at the distribution point for the purposes of isolation, system maintenance, emergency disconnection, or connection of optional standby systems.

The purpose of the site-isolating device is to provide a means to disconnect and isolate the agricultural premises wiring system from the serving utility under emergency conditions, for maintenance of the load-side wiring system or to

allow for the connection of an alternate power source when there is a power outage. In accordance with 547.9(A)(2), the site-isolating device must be pole-mounted, and, as its name implies, it is an isolating switch and is not considered to be the service disconnecting means for the agricultural premises.

## 547.3 Other Articles

For buildings and structures not having conditions as specified in 547.1, the electrical installations shall be made in accordance with the applicable articles in this *Code*.

## 547.4 Surface Temperatures

Electrical equipment or devices installed in accordance with the provisions of this article shall be installed in a manner such that they will function at full rating without developing surface temperatures in excess of the specified normal safe operating range of the equipment or device.

## 547.5 Wiring Methods

**(A) Wiring Systems.** Types UF, NMC, copper SE cables, jacketed Type MC cable, rigid nonmetallic conduit, liquid-tight flexible nonmetallic conduit, or other cables or raceways suitable for the location, with approved termination fittings, shall be the wiring methods employed. The wiring methods of Article 502, Part II, shall be permitted for areas described in 547.1(A).

Informational Note: See 300.7, 352.44, and 355.44 for installation of raceway systems exposed to widely different temperatures.

**(B) Mounting.** All cables shall be secured within 200 mm (8 in.) of each cabinet, box, or fitting. Nonmetallic boxes, fittings, conduit, and cables shall be permitted to be mounted directly to any building surface covered by this article without maintaining the 6 mm (¼ in.) airspace in accordance with 300.6(D).

Cables are required to be secured within 8 in. of cabinets, boxes, or fittings installed in agricultural buildings. This distance is less than that required for cables in other types of occupancies. The requirement for a ¼-in. airspace in 300.6(D) is judged unnecessary in agricultural buildings, provided nonmetallic wiring methods are used. Decreasing the support spacing requirements coupled with eliminating the ¼-in. airspace requirement reduces the potential for physical damage to cable-type wiring methods. Locating the wiring methods directly on the interior surface of the building allows a sealant to be placed along the wiring method to facilitate cleaning. See also 300.6(D), Exception.

### (C) Equipment Enclosures, Boxes, Conduit Bodies, and Fittings.

**(1) Excessive Dust.** Equipment enclosures, boxes, conduit bodies, and fittings installed in areas of buildings where excessive dust may be present shall be designed to minimize the entrance of dust and shall have no openings (such as holes for attachment screws) through which dust could enter the enclosure.

**(2) Damp or Wet Locations.** In damp or wet locations, equipment enclosures, boxes, conduit bodies, and fittings shall be placed or equipped so as to prevent moisture from entering or accumulating within the enclosure, box, conduit body, or fitting. In wet locations, including normally dry or damp locations where surfaces are periodically washed or sprayed with water, boxes, conduit bodies, and fittings shall be listed for use in wet locations and equipment enclosures shall be weatherproof.

**(3) Corrosive Atmosphere.** Where wet dust, excessive moisture, corrosive gases or vapors, or other corrosive conditions may be present, equipment enclosures, boxes, conduit bodies, and fittings shall have corrosion resistance properties suitable for the conditions.

Informational Note No. 1: See Table 110.28 for appropriate enclosure type designations.

Informational Note No. 2: Aluminum and magnetic ferrous materials may corrode in agricultural environments.

Section 547.5(C) requires appropriate enclosures for the conditions encountered and includes consideration of the type of enclosure and the materials used in its construction. Gasketed weatherproof enclosures, for example, may not provide adequate ventilation for certain types of sensitive equipment, such as electronic equipment. In some cases, providing ventilation by using other types of enclosures may be necessary.

**(D) Flexible Connections.** Where necessary to employ flexible connections, dusttight flexible connectors, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit, or flexible cord listed and identified for hard usage shall be used. All connectors and fittings used shall be listed and identified for the purpose.

**(E) Physical Protection.** All electrical wiring and equipment subject to physical damage shall be protected.

**(F) Separate Equipment Grounding Conductor.** Where an equipment grounding conductor is installed within a location falling under the scope of Article 547, it shall be a copper conductor. Where an equipment grounding conductor is

installed underground, it shall be insulated or covered copper.

This requirement improves the longevity of equipment grounding conductors installed above ground and underground in the highly corrosive locations that are typical of many farm buildings.

**(G) Receptacles.** All 125-volt, single-phase, 15- and 20-ampere general-purpose receptacles installed in the locations listed in (1) through (4) shall have ground-fault circuit-interrupter protection:

- (1) Areas having an equipotential plane
- (2) Outdoors
- (3) Damp or wet locations
- (4) Dirt confinement areas for livestock

### 547.6 Switches, Receptacles, Circuit Breakers, Controllers, and Fuses

Switches, including pushbuttons, relays, and similar devices, receptacles, circuit breakers, controllers, and fuses, shall be provided with enclosures as specified in 547.5(C).

### 547.7 Motors

Motors and other rotating electrical machinery shall be totally enclosed or designed so as to minimize the entrance of dust, moisture, or corrosive particles.

### 547.8 Luminaires

Luminaires shall comply with 547.8(A) through (C).

**(A) Minimize the Entrance of Dust.** Luminaires shall be installed to minimize the entrance of dust, foreign matter, moisture, and corrosive material.

**(B) Exposed to Physical Damage.** Luminaires exposed to physical damage shall be protected by a suitable guard.

**(C) Exposed to Water.** Luminaires exposed to water from condensation, building cleansing water, or solution shall be listed as suitable for use in wet locations.

### 547.9 Electrical Supply to Building(s) or Structure(s) from a Distribution Point

A distribution point shall be permitted to supply any building or structure located on the same premises. The overhead electrical supply shall comply with 547.9(A) and (B), or with 547.9(C). The underground electrical supply shall comply with 547.9(C).

**(A) Site-Isolating Device.** Site-isolating devices shall comply with 547.9(A)(1) through (A)(10).

**(1) Where Required.** A site-isolating device shall be installed at the distribution point where two or more agricultural buildings or structures are supplied from the distribution point.

**(2) Location.** The site-isolating device shall be pole-mounted and be not less than the height above grade required by 230.24 for the conductors it supplies.

**(3) Operation.** The site-isolating device shall simultaneously disconnect all ungrounded service conductors from the premises wiring.

**(4) Bonding Provisions.** The site-isolating device enclosure shall be connected to the grounded circuit conductor and the grounding electrode system.

**(5) Grounding.** At the site-isolating device, the system grounded conductor shall be connected to a grounding electrode system via a grounding electrode conductor.

**(6) Rating.** The site-isolating device shall be rated for the calculated load as determined by Part V of Article 220.

**(7) Overcurrent Protection.** The site-isolating device shall not be required to provide overcurrent protection.

**(8) Accessibility.** The site-isolating device shall be capable of being remotely operated by an operating handle installed at a readily accessible location. The operating handle of the site-isolating device, when in its highest position, shall not be more than 2.0 m (6 ft 7 in.) above grade or a working platform.

**(9) Series Devices.** An additional site-isolating device for the premises wiring system shall not be required where a site-isolating device meeting all applicable requirements of this section is provided by the serving utility as part of their service requirements.

**(10) Marking.** A site-isolating device shall be permanently marked to identify it as a site-isolating device. This marking shall be located on the operating handle or immediately adjacent thereto.

**(B) Service Disconnecting Means and Overcurrent Protection at the Building(s) or Structure(s).** Where the service disconnecting means and overcurrent protection are located at the building(s) or structure(s), the requirements of 547.9(B)(1) through (B)(3) shall apply.

**(1) Conductor Sizing.** The supply conductors shall be sized in accordance with Part V of Article 220.

**(2) Conductor Installation.** The supply conductors shall be installed in accordance with the requirements of Part II of Article 225.

**(3) Grounding and Bonding.** For each building or structure, grounding and bonding of the supply conductors shall be in accordance with the requirements of 250.32, and the following conditions shall be met:

- (1) The equipment grounding conductor is not smaller than the largest supply conductor if of the same material, or is adjusted in size in accordance with the equivalent size columns of Table 250.122 if of different materials.
- (2) The equipment grounding conductor is connected to the grounded circuit conductor and the site-isolating device at the distribution point.

**(C) Service Disconnecting Means and Overcurrent Protection at the Distribution Point.** Where the service disconnecting means and overcurrent protection for each set of feeders or branch circuits are located at the distribution point, the feeders or branch circuits to buildings or structures shall comply with the provisions of 250.32 and Article 225, Parts I and II.

Informational Note: Methods to reduce neutral-to-earth voltages in livestock facilities include supplying buildings or structures with 4-wire single-phase services, sizing 3-wire single-phase service and feeder conductors to limit voltage drop to 2 percent, and connecting loads line-to-line.

**(D) Identification.** Where a site is supplied by more than one distribution point, a permanent plaque or directory shall be installed at each of these distribution points denoting the location of each of the other distribution points and the buildings or structures served by each.

The requirements in 547.9 cover the installation of conductors that originate from an electrical distribution point and supply agricultural buildings. The term *distribution point* is defined in 547.2 as “an electrical supply point from which service drops, service conductors, feeders, or branch circuits to buildings or structures utilized under single management are supplied.”

Many agricultural sites consist of multiple buildings that are directly related to or support the operation. A distribution point, sometimes referred to as the center yard pole, is often used as a means of centrally locating the origin of the electrical distribution system that supplies multiple buildings via an overhead distribution system. A means to

disconnect all ungrounded conductors run to the buildings and structures that are supplied from the distribution point is required. This site-isolating device provides a means to disconnect all power to the buildings at the agricultural site from a single location in the event of an emergency, for the purposes of maintenance, or for connection to a standby power source. The intent of referring to this disconnecting means as the site-isolating device is so that it is not considered the service disconnecting means.

The site-isolating device is required to be pole-mounted to the height required for the conductors it supplies, thereby rendering the device inaccessible. The remote operating handle for the site-isolating device must be readily accessible to personnel, be located not more than 6 ft 7 in. above finished grade, and be permanently marked to identify it as the site-isolating device. An additional site-isolating device is not required if a device that meets the requirements of 547.9 is provided by the serving utility. If the supply system includes a grounded conductor, it must be connected to a grounding electrode system at the site-isolating device.

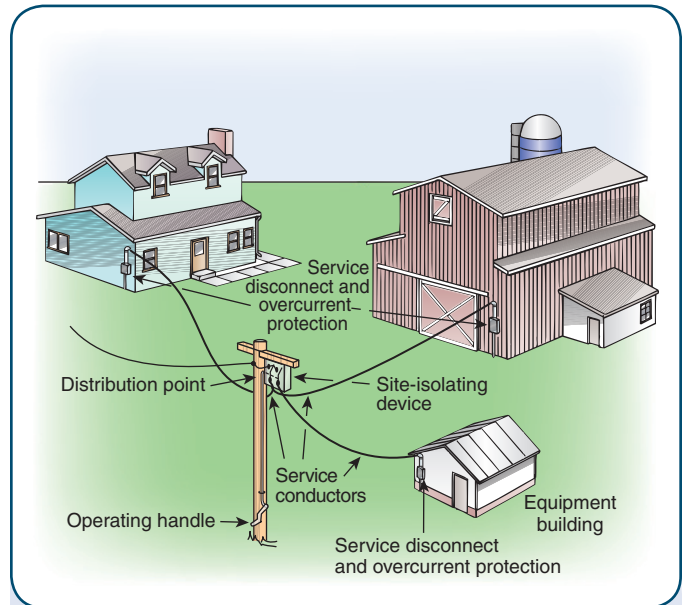

The site-isolating device is not required to have provisions for overcurrent protection, nor is overcurrent protection for the load-side conductors required to be located immediately adjacent to this device. Based on the requirements in 547.9(A) and (B), the location of the service disconnecting means and overcurrent protection is on the load side of the site-isolating device, either at the distribution point or at the building or structure supplied. Where the site is supplied by more than one distribution point, a plaque or directory is required at each site-isolating device that provides information about the location of each of the distribution points and the buildings served by each distribution point.

A site-isolating device is not required where the service equipment is located at the distribution point in accordance with 547.9(C).

In Exhibit 547.1, the pole-mounted site-isolating device is located at the distribution point. A set of overload service conductors is run to each of the three structures on the premises, and at each of the buildings the service disconnecting means and overcurrent protection are installed. The supply conductors are service conductors because there is no overcurrent protection at the site-isolating device. A grounding electrode system is required at the distribution point, and a grounding electrode conductor connection to the supply system grounded conductor must be made at the site-isolating device. A grounding electrode system is also required at each of the buildings.

The equipment grounding conductor must not be smaller than the largest supply conductor, or if it is of different conductor material than the supply conductors, it must be adjusted in size based on Table 250.122.

Any portion of the equipment grounding conductor in-

**EXHIBIT 547.1** Site-isolating device located at the distribution point with service conductors run to each building. A service disconnecting means and overcurrent protection is installed at each building.

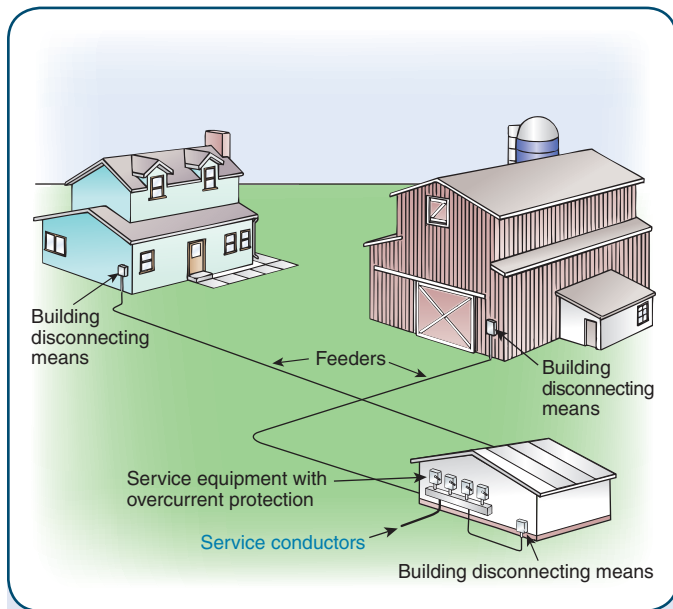

stalled underground in raceways, in cable assemblies, or direct-buried must be insulated or covered copper in accordance with 547.5(F). This provision applies to the equipment grounding conductor of all underground branch circuits and feeders covered by the requirements of Article 547. The intent of this requirement is to protect the equipment grounding conductor from the corrosive influences inherent to agricultural premises and to reduce leakage current in those areas where livestock are kept, because prevention of stray voltage at agricultural premises is of the utmost importance.

In Exhibit 547.2, the service equipment and overcurrent protection are located at the distribution point. This distribution arrangement does not require a site-isolating device per 547.9. A set of feeder conductors is run to each of the three structures on the premises. At the distribution point, a grounding electrode system is required, and in accordance with 250.32 a grounding electrode system is required at each of the buildings. In addition, a disconnecting means at each of the structures is required per 225.31 and 225.32. This distribution arrangement for agricultural sites is covered in 547.9(C).

## 547.10 Equipotential Planes and Bonding of Equipotential Planes

The installation and bonding of equipotential planes shall comply with 547.10(A) and (B). For the purposes of this section, the term *livestock* shall not include poultry.

**EXHIBIT 547.2** Service disconnecting means and overcurrent protection located at the distribution point with feeders run to each building.

**(A) Where Required.** Equipotential planes shall be installed where required in (A)(1) and (A)(2).

**(1) Indoors.** Equipotential planes shall be installed in confinement areas with concrete floors where metallic equipment is located that may become energized and is accessible to livestock.

**(2) Outdoors.** Equipotential planes shall be installed in concrete slabs where metallic equipment is located that may become energized and is accessible to livestock.

The equipotential plane shall encompass the area where the livestock stands while accessing metallic equipment that may become energized.

**(B) Bonding.** Equipotential planes shall be connected to the electrical grounding system. The bonding conductor shall be **solid** copper, insulated, covered or bare, and not smaller than 8 AWG. The means of bonding to wire mesh or conductive elements shall be by pressure connectors or clamps of brass, copper, copper alloy, or an equally substantial approved means. Slatted floors that are supported by structures that are a part of an equipotential plane shall not require bonding.

Informational Note No. 1: Methods to establish equipotential planes are described in American Society of Agricultural and Biological Engineers (ASABE) EP473.2-2001, *Equipotential Planes in Animal Containment Areas*.

Informational Note No. 2: Methods for safe installation of livestock waterers are described in American Society of Ag-

ricultural and Biological Engineers (ASABE) EP342.2-1995, *Safety for Electrically Heated Livestock Waterers*.

Electrically heated livestock watering troughs could pose an electric shock hazard for livestock and personnel. The referenced document provides information on the proper installation of this equipment.

Informational Note No. 3: Low grounding electrode system resistances may reduce potential differences in livestock facilities.

## I. General

### 550.1 Scope

The provisions of this article cover the electrical conductors and equipment installed within or on mobile and manufactured homes, the conductors that connect mobile and manufactured homes to a supply of electricity, and the installation of electrical wiring, luminaires, equipment, and appurtenances related to electrical installations within a mobile home park up to the mobile home service-entrance conductors or, if none, the mobile home service equipment.

Informational Note: For additional information on manufactured housing see NFPA 501-2010, *Standard on Manufactured Housing*, and Part 3280, *Manufactured Home Construction and Safety Standards*, of the Federal Department of Housing and Urban Development.

The *Federal Mobile Home Construction and Safety Standard*, issued by the Federal Housing and Urban Development Administration (HUD), incorporates many of the requirements of Article 550 of the *NEC*. The federal standard contains the requirements for electrical systems, conductors, and equipment installed within or on mobile homes and the conductors that connect mobile homes to a supply of electricity. Mobile homes are defined as manufactured homes in the HUD regulations. For the purposes of this *Code*, and unless otherwise indicated, the term *mobile home* includes manufactured homes.

The regulations pertaining to electrical systems are located in 24 CFR 3280.801–3280.816. They require that new manufactured homes comply with the federal standard. In some cases, HUD has delegated the enforcement of this standard to state and private inspection agencies and qualified testing laboratories. The service equipment and feeders installed at the mobile or manufactured home site are covered by the requirements in Part III of this article.

See Article 545 for the requirements covering electrical systems in manufactured buildings.

## 550.2 Definitions

**Appliance, Fixed.** An appliance that is fastened or otherwise secured at a specific location.

**Appliance, Portable.** An appliance that is actually moved or can easily be moved from one place to another in normal use.

Informational Note: For the purpose of this article, the following major appliances, other than built-in, are considered portable if cord connected: refrigerators, range equipment, clothes washers, dishwashers without booster heaters, or other similar appliances.

**Appliance, Stationary.** An appliance that is not easily moved from one place to another in normal use.

**Distribution Panelboard.** See definition of panelboard in Article 100.

**Feeder Assembly.** The overhead or under-chassis feeder conductors, including the grounding conductor, together with the necessary fittings and equipment or a power-supply cord listed for mobile home use, designed for the purpose of delivering energy from the source of electrical supply to the distribution panelboard within the mobile home.

**Laundry Area.** An area containing or designed to contain a laundry tray, clothes washer, or a clothes dryer.

**Manufactured Home.** A structure, transportable in one or more sections, that, in the traveling mode, is 2.4 m (8 body-ft) or more in width or 12.2 m (40 body-ft) or more in length, or, when erected on site, is 29.7 m<sup>2</sup> (320 ft<sup>2</sup>) or more and that is built on a permanent chassis and designed to be used as a dwelling, with or without a permanent foundation, when connected therein. The term *manufactured home* includes any structure that meets all the provisions of this paragraph except the size requirements and with respect to which the manufacturer voluntarily files a certification required by the regulatory agency, and except that such term does not include any self-propelled recreational vehicle. Calculations used to determine the number of square meters (square feet) in a structure are based on the structure's exterior dimensions, measured at the largest horizontal projections when erected on site. These dimensions include all expandable rooms, cabinets, and other projections containing interior space but do not include bay windows.

For the purpose of this *Code* and unless otherwise indicated, the term *mobile home* includes manufactured homes.

Informational Note No. 1: See the applicable building code for definition of the term *permanent foundation*.

Informational Note No. 2: See Part 3280, *Manufactured Home Construction and Safety Standards, of the Federal*

*Department of Housing and Urban Development*, for additional information on the definition.

**Mobile Home.** A factory-assembled structure or structures transportable in one or more sections that are built on a permanent chassis and designed to be used as a dwelling without a permanent foundation where connected to the required utilities and that include the plumbing, heating, air-conditioning, and electrical systems contained therein.

For the purpose of this *Code* and unless otherwise indicated, the term *mobile home* includes manufactured homes.

**Mobile Home Accessory Building or Structure.** Any awning, cabana, ramada, storage cabinet, carport, fence, wind-break, or porch established for the use of the occupant of the mobile home on a mobile home lot.

*Mobile home* is the original term covering a structure that is built on a chassis, designed to be transportable and intended for installation on a site with or without a permanent foundation. The *Code* has covered these units and their associated site equipment since the 1965 edition. Manufactured homes (not to be confused with manufactured buildings, covered in Article 545) are also covered by Article 550 and, for the purposes of this article, are considered mobile homes. The term *manufactured home* is used in the federal standard that covers their construction. The requirements in Article 550 treat mobile and manufactured homes the same unless specifically stated otherwise. An example of a distinction between the two is found in 550.32(B), which contains provisions exclusive to manufactured homes that cover mounting of service equipment on the structure.

The requirements contained in Article 550, Part III cover the installation of service equipment and feeders at mobile and manufactured home sites. It is intended that mobile and manufactured homes constructed in accordance with the requirements of Article 550, Parts I and II (or under the HUD 24 CFR 3280 regulations) be installed at their sites in accordance with the requirements of Part III. For more information on the distinction between manufactured homes and manufactured buildings, see the commentary following 545.1.

**Mobile Home Lot.** A designated portion of a mobile home park designed for the accommodation of one mobile home and its accessory buildings or structures for the exclusive use of its occupants.

**Mobile Home Park.** A contiguous parcel of land that is used for the accommodation of occupied mobile homes.

**Mobile Home Service Equipment.** The equipment containing the disconnecting means, overcurrent protective devices, and receptacles or other means for connecting a mobile home feeder assembly.

**Park Electrical Wiring Systems.** All of the electrical wiring, luminaires, equipment, and appurtenances related to electrical installations within a mobile home park, including the mobile home service equipment.

#### 550.4 General Requirements

**(A) Mobile Home Not Intended as a Dwelling Unit.** A mobile home not intended as a dwelling unit — for example, those equipped for sleeping purposes only, contractor's on-site offices, construction job dormitories, mobile studio dressing rooms, banks, clinics, mobile stores, or intended for the display or demonstration of merchandise or machinery — shall not be required to meet the provisions of this article pertaining to the number or capacity of circuits required. It shall, however, meet all other applicable requirements of this article if provided with an electrical installation intended to be energized from a 120-volt or 120/240-volt ac power supply system. Where different voltage is required by either design or available power supply system, adjustment shall be made in accordance with other articles and sections for the voltage used.

**(B) In Other Than Mobile Home Parks.** Mobile homes installed in other than mobile home parks shall comply with the provisions of this article.

**(C) Connection to Wiring System.** The provisions of this article shall apply to mobile homes intended for connection to a wiring system rated 120/240 volts, nominal, 3-wire ac, with a grounded neutral conductor.

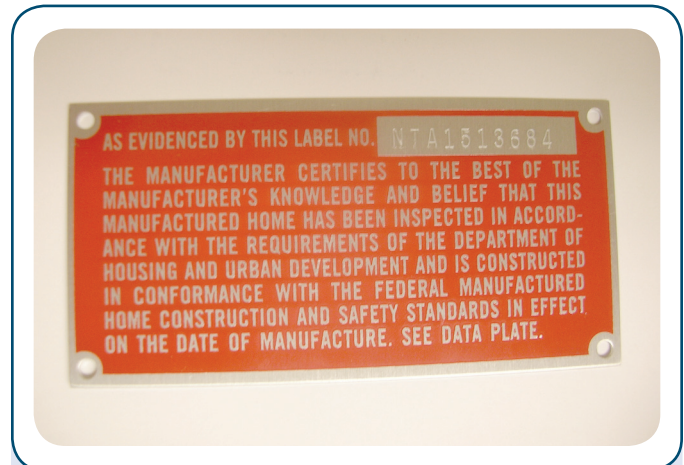

**(D) Listed or Labeled.** All electrical materials, devices, appliances, fittings, and other equipment shall be listed or labeled by a qualified testing agency and shall be connected in an approved manner when installed.

## II. Mobile and Manufactured Homes

Manufactured or mobile homes are required to meet federal standards. See commentary following 550.1. Mobile home manufacturers attach a label certifying that the construction is in accordance with those standards. This certification facilitates the transport of these homes nationwide by allowing AHJ approval without having to dismantle the home to verify the construction and electrical installation. Although this federal process supersedes local codes for the home construction, local codes are applicable for the onsite work. Refer to Exhibit 550.1 for an example of the HUD label.

### 550.10 Power Supply

**(A) Feeder.** The power supply to the mobile home shall be a feeder assembly consisting of not more than one listed 50-ampere mobile home power-supply cord or a permanently installed feeder.

**EXHIBIT 550.1** A HUD label required for mobile homes.

*Exception No. 1: A mobile home that is factory equipped with gas or oil-fired central heating equipment and cooking appliances shall be permitted to be provided with a listed mobile home power-supply cord rated 40 amperes.*

*Exception No. 2: A feeder assembly shall not be required for manufactured homes constructed in accordance with 550.32(B).*

Exception No. 2 modifies the requirement only for manufactured homes. The installation of service equipment is permitted in or on a manufactured home per 550.32(B).

**(B) Power-Supply Cord.** If the mobile home has a power-supply cord, it shall be permanently attached to the distribution panelboard or to a junction box permanently connected to the distribution panelboard, with the free end terminating in an attachment plug cap.

Cords with adapters and pigtail ends, extension cords, and similar items shall not be attached to, or shipped with, a mobile home.

A suitable clamp or the equivalent shall be provided at the distribution panelboard knockout to afford strain relief for the cord to prevent strain from being transmitted to the terminals when the power-supply cord is handled in its intended manner.

The cord shall be a listed type with four conductors, one of which shall be identified by a continuous green color or a continuous green color with one or more yellow stripes for use as the grounding conductor.

**(C) Attachment Plug Cap.** The attachment plug cap shall be a 3-pole, 4-wire, grounding type, rated 50 amperes, 125/250 volts with a configuration as shown in Figure 550.10(C) and intended for use with the 50-ampere,

125/250-volt receptacle configuration shown in Figure 550.10(C). It shall be listed, by itself or as part of a power-supply cord assembly, for the purpose and shall be molded to or installed on the flexible cord so that it is secured tightly to the cord at the point where the cord enters the attachment plug cap. If a right-angle cap is used, the configuration shall be oriented so that the grounding member is farthest from the cord.

**Informational Note:** Complete details of the 50-ampere plug and receptacle configuration can be found in the National Electrical Manufacturers Association *Standard for Dimensions of Attachment Plugs and Receptacles*, ANSI/NEMA WD 6-1989, Figure 14-50.

**FIGURE 550.10(C) 50-Ampere, 125/250-Volt Receptacle and Attachment Plug Cap Configurations, 3-Pole, 4-Wire, Grounding-Types, Used for Mobile Home Supply Cords and Mobile Home Parks.**

**(D) Overall Length of a Power-Supply Cord.** The overall length of a power-supply cord, measured from the end of the cord, including bared leads, to the face of the attachment plug cap shall not be less than 6.4 m (21 ft) and shall not exceed 11 m (36½ ft). The length of the cord from the face of the attachment plug cap to the point where the cord enters the mobile home shall not be less than 6.0 m (20 ft).

**(E) Marking.** The power-supply cord shall bear the following marking:

FOR USE WITH MOBILE HOMES — 40 AMPERES

or

FOR USE WITH MOBILE HOMES — 50 AMPERES

**(F) Point of Entrance.** The point of entrance of the feeder assembly to the mobile home shall be in the exterior wall, floor, or roof.

**(G) Protected.** Where the cord passes through walls or floors, it shall be protected by means of conduits and bushings or equivalent. The cord shall be permitted to be installed within the mobile home walls, provided a continuous raceway having a maximum size of 32 mm (1¼ in.) is installed from the branch-circuit panelboard to the underside of the mobile home floor.

**(H) Protection Against Corrosion and Mechanical Damage.** Permanent provisions shall be made for the protection

of the attachment plug cap of the power-supply cord and any connector cord assembly or receptacle against corrosion and mechanical damage if such devices are in an exterior location while the mobile home is in transit.

**(I) Mast Weatherhead or Raceway.** Where the calculated load exceeds 50 amperes or where a permanent feeder is used, the supply shall be by means of either of the following:

- (1) One mast weatherhead installation, installed in accordance with Article 230, containing four continuous, insulated, color-coded feeder conductors, one of which shall be an equipment grounding conductor
- (2) A metal raceway or rigid nonmetallic conduit from the disconnecting means in the mobile home to the underside of the mobile home, with provisions for the attachment to a suitable junction box or fitting to the raceway on the underside of the mobile home [with or without conductors as in 550.10(I)(1)]. The manufacturer shall provide written installation instructions stating the proper feeder conductor sizes for the raceway and the size of the junction box to be used.

Cord-and-plug connection is permitted for loads that do not exceed 50 amperes but today's larger mobile and manufactured homes often contain more electrical equipment than before and often exceed this rating. As covered in 550.10(I), a permanently connected feeder is required if the calculated load exceeds 50 amperes. Local requirements must be checked for the approved method of installing overhead and underground feeder assemblies.

A raceway is required from the distribution panelboard in the mobile home to the underside of the mobile home. Typically, the feeder conductors in this raceway are installed when the mobile home is located at its site. The raceway provides a means to install the feeder conductors to the mobile home panelboard without damaging the interior finish. The feeder assembly must comprise four continuous, insulated, color-coded conductors, as indicated in 550.10(I)(1) and 550.33(A).

## 550.11 Disconnecting Means and Branch-Circuit Protective Equipment

The branch-circuit equipment shall be permitted to be combined with the disconnecting means as a single assembly. Such a combination shall be permitted to be designated as a distribution panelboard. If a fused distribution panelboard is used, the maximum fuse size for the mains shall be plainly marked with lettering at least 6 mm (¼ in.) high and visible when fuses are changed.

Where plug fuses and fuseholders are used, they shall be tamper-resistant Type S, enclosed in dead-front fuse pan-

elboards. Electrical distribution panelboards containing circuit breakers shall also be dead-front type.

Informational Note: See 110.22 concerning identification of each disconnecting means and each service, feeder, or branch circuit at the point where it originated and the type marking needed.

**(A) Disconnecting Means.** A single disconnecting means shall be provided in each mobile home consisting of a circuit breaker, or a switch and fuses and its accessories installed in a readily accessible location near the point of entrance of the supply cord or conductors into the mobile home. The main circuit breakers or fuses shall be plainly marked "Main." This equipment shall contain a solderless type of grounding connector or bar for the purposes of grounding, with sufficient terminals for all grounding conductors. The terminations of the grounded circuit conductors shall be insulated in accordance with 550.16(A). The disconnecting equipment shall have a rating not less than the calculated load. The distribution equipment, either circuit breaker or fused type, shall be located a minimum of 600 mm (24 in.) from the bottom of such equipment to the floor level of the mobile home.

Informational Note: See 550.20(B) for information on disconnecting means for branch circuits designed to energize heating or air-conditioning equipment, or both, located outside the mobile home, other than room air conditioners.

A distribution panelboard shall be rated not less than 50 amperes and employ a 2-pole circuit breaker rated 40 amperes for a 40-ampere supply cord, or 50 amperes for a 50-ampere supply cord. A distribution panelboard employing a disconnect switch and fuses shall be rated 60 amperes and shall employ a single 2-pole, 60-ampere fuseholder with 40- or 50-ampere main fuses for 40- or 50-ampere supply cords, respectively. The outside of the distribution panelboard shall be plainly marked with the fuse size.

The distribution panelboard shall be located in an accessible location but shall not be located in a bathroom or a clothes closet. A clear working space at least 750 mm (30 in.) wide and 750 mm (30 in.) in front of the distribution panelboard shall be provided. This space shall extend from the floor to the top of the distribution panelboard.

**(B) Branch-Circuit Protective Equipment.** Branch-circuit distribution equipment shall be installed in each mobile home and shall include overcurrent protection for each branch circuit consisting of either circuit breakers or fuses.

The branch-circuit overcurrent devices shall be rated as follows:

- (1) Not more than the circuit conductors; and
- (2) Not more than 150 percent of the rating of a single appliance rated 13.3 amperes or more that is supplied by an individual branch circuit; but

- (3) Not more than the overcurrent protection size and of the type marked on the air conditioner or other motor-operated appliance.

**(C) Two-Pole Circuit Breakers.** Where circuit breakers are provided for branch-circuit protection, 240-volt circuits shall be protected by a 2-pole common or companion trip, or by circuit breakers with identified handle ties.

**(D) Electrical Nameplates.** A metal nameplate on the outside adjacent to the feeder assembly entrance shall read as follows:

THIS CONNECTION FOR 120/240-VOLT,  
3-POLE, 4-WIRE, 60-HERTZ,  
\_\_\_\_\_ AMPERE SUPPLY

The correct ampere rating shall be marked in the blank space.

*Exception:* For manufactured homes, the manufacturer shall provide in its written installation instructions or in the data plate the minimum ampere rating of the feeder assembly or, where provided, the service-entrance conductors intended for connection to the manufactured home. The rating provided shall not be less than the minimum load calculated in accordance with 550.18.

## 550.12 Branch Circuits

The number of branch circuits required shall be determined in accordance with 550.12(A) through (E).

**(A) Lighting.** The number of branch circuits shall be based on 33 volt-amperes/m<sup>2</sup> (3 VA/ft<sup>2</sup>) times outside dimensions of the mobile home (coupler excluded) divided by 120 volts to determine the number of 15- or 20-ampere lighting area circuits, for example,

$$\frac{3 \times \text{length} \times \text{width}}{120 \times 15 \text{ (or 20)}} = \text{No. of 15- (or 20-) ampere circuits}$$

**(B) Small Appliances.** In kitchens, pantries, dining rooms, and breakfast rooms, two or more 20-ampere small-appliance circuits, in addition to the number of circuits required elsewhere in this section, shall be provided for all receptacle outlets required by 550.13(D) in these rooms. Such circuits shall have no other outlets.

*Exception No. 1:* Receptacle outlets installed solely for the electrical supply and support of an electric clock in any the rooms specified in 550.12(B) shall be permitted.

*Exception No. 2:* Receptacle outlets installed to provide power for supplemental equipment and lighting on gas-fired ranges, ovens, or counter-mounted cooking units shall be permitted.

*Exception No. 3: A single receptacle for refrigeration equipment shall be permitted to be supplied from an individual branch circuit rated 15 amperes or greater.*

Countertop receptacle outlets installed in the kitchen shall be supplied by not less than two small-appliance circuit branch circuits, either or both of which shall be permitted to supply receptacle outlets in the kitchen and other locations specified in 550.12(B).

**(C) Laundry Area.** Where a laundry area is provided, a 20-ampere branch circuit shall be provided to supply the laundry receptacle outlet(s). This circuit shall have no other outlets.

If a laundry area is provided, a 20-ampere laundry circuit is required and may not supply other outlets beyond the laundry area.

**(D) General Appliances.** (Including furnace, water heater, range, and central or room air conditioner, etc.). There shall be one or more circuits of adequate rating in accordance with the following:

Informational Note: For central air conditioning, see Article 440.

- (1) The ampere rating of fixed appliances shall be not over 50 percent of the circuit rating if lighting outlets (receptacles, other than kitchen, dining area, and laundry, considered as lighting outlets) are on the same circuit.
- (2) For fixed appliances on a circuit without lighting outlets, the sum of rated amperes shall not exceed the branch-circuit rating. Motor loads or continuous loads shall not exceed 80 percent of the branch-circuit rating.
- (3) The rating of a single cord-and-plug-connected appliance on a circuit having no other outlets shall not exceed 80 percent of the circuit rating.
- (4) The rating of a range branch circuit shall be based on the range demand as specified for ranges in 550.18(B)(5).

**(E) Bathrooms.** Bathroom receptacle outlets shall be supplied by at least one 20-ampere branch circuit. Such circuits shall have no outlets other than as provided for in 550.13(E)(2).

### 550.13 Receptacle Outlets

**(A) Grounding-Type Receptacle Outlets.** All receptacle outlets shall comply with the following:

- (1) Be of grounding type
- (2) Be installed according to 406.4

- (3) Except where supplying specific appliances, be 15- or 20-ampere, 125-volt, either single or multiple type, and accept parallel-blade attachment plugs

**(B) Ground-Fault Circuit Interrupters (GFCI).** All 125-volt, single-phase, 15- and 20-ampere receptacle outlets installed outdoors, in compartments accessible from outside the unit, or in bathrooms, including receptacles in luminaires, shall have GFCI protection. GFCI protection shall be provided for receptacle outlets serving countertops in kitchens and receptacle outlets located within 1.8 m (6 ft) of a wet bar sink. **The exceptions in 210.8(A) shall be permitted.**

Feeders supplying branch circuits shall be permitted to be protected by a ground-fault circuit-interrupter in lieu of the provision for such interrupters specified herein.

The locations where GFCI protection is required for receptacles installed in a mobile or manufactured home parallel those specified in 210.8(A) for site-built dwelling units. The exceptions in 210.8(A) are limited to an outdoor receptacle(s) installed for deicing or snow-melting equipment and to a receptacle(s) located in a basement installed to supply a fire or burglar control panel. Because mobile and manufactured homes typically do not have basements, only the exception covering an outdoor receptacle for deicing or snow-melting equipment has any relevance to the types of dwelling units covered within the scope of Article 550.

**(C) Cord-Connected Fixed Appliance.** A grounding-type receptacle outlet shall be provided for each cord-connected fixed appliance installed.

**(D) Receptacle Outlets Required.** Except in the bath, closet, and hallway areas, receptacle outlets shall be installed at wall spaces 600 mm (2 ft) wide or more so that no point along the floor line is more than 1.8 m (6 ft) measured horizontally from an outlet in that space. In addition, a receptacle outlet shall be installed in the following locations:

- (1) Over or adjacent to countertops in the kitchen [at least one on each side of the sink if countertops are on each side and are 300 mm (12 in.) or over in width].
- (2) Adjacent to the refrigerator and freestanding gas-range space. A multiple-type receptacle shall be permitted to serve as the outlet for a countertop and a refrigerator.
- (3) At countertop spaces for built-in vanities.
- (4) At countertop spaces under wall-mounted cabinets.
- (5) In the wall at the nearest point to where a bar-type counter attaches to the wall.
- (6) In the wall at the nearest point to where a fixed room divider attaches to the wall.
- (7) In laundry areas within 1.8 m (6 ft) of the intended location of the laundry appliance(s).

- (8) At least one receptacle outlet located outdoors and accessible at grade level and not more than 2.0 m (6½ ft) above grade. A receptacle outlet located in a compartment accessible from the outside of the unit shall be considered an outdoor receptacle.
- (9) At least one receptacle outlet shall be installed in bathrooms within 900 mm (36 in.) of the outside edge of each basin. The receptacle outlet shall be located above or adjacent to the basin location. This receptacle shall be in addition to any receptacle that is a part of a luminaire or appliance. The receptacle shall not be enclosed within a bathroom cabinet or vanity.

**(E) Pipe Heating Cable(s) Outlet.** For the connection of pipe heating cable(s), a receptacle outlet shall be located on the underside of the unit as follows:

- (1) Within 600 mm (2 ft) of the cold water inlet.
- (2) Connected to an interior branch circuit, other than a small-appliance branch circuit. It shall be permitted to use a bathroom receptacle circuit for this purpose.
- (3) On a circuit where all of the outlets are on the load side of the ground-fault circuit-interrupter.
- (4) This outlet shall not be considered as the receptacle required by 550.13(D)(8).

A receptacle outlet is required on the underside of mobile homes to supply cord-and-plug-connected pipe-heating cables (sometimes referred to as heat tape outlets). The receptacle must be GFCI protected and connected to a branch circuit that serves the interior of the mobile home. All the outlets supplied by this branch circuit must be on the load (downstream) side of a GFCI. The purpose of arranging the supply circuit to the pipe heating cable outlet in this manner is to allow supervision of the power supply to, and GFCI protection of, this outlet from the interior of the mobile home. If the overcurrent protective device or GFCI device opens, the occupants of the mobile home are more likely to notice it than if the outlet were supplied by a dedicated circuit and the GFCI device were located at the outlet.

**(F) Receptacle Outlets Not Permitted.** Receptacle outlets shall not be permitted in the following locations:

- (1) Receptacle outlets shall not be installed within or directly over a bathtub or shower space.
- (2) A receptacle shall not be installed in a face-up position in any countertop.
- (3) Receptacle outlets shall not be installed above electric baseboard heaters, unless provided for in the listing or manufacturer's instructions.

**(G) Receptacle Outlets Not Required.** Receptacle outlets shall not be required in the following locations:

- (1) In the wall space occupied by built-in kitchen or wardrobe cabinets
- (2) In the wall space behind doors that can be opened fully against a wall surface
- (3) In room dividers of the lattice type that are less than 2.5 m (8 ft) long, not solid, and within 150 mm (6 in.) of the floor
- (4) In the wall space afforded by bar-type counters

#### 550.14 Luminaires and Appliances

**(A) Fasten Appliances in Transit.** Means shall be provided to securely fasten appliances when the mobile home is in transit. (See 550.16 for provisions on grounding.)

**(B) Accessibility.** Every appliance shall be accessible for inspection, service, repair, or replacement without removal of permanent construction.

**(C) Pendants.** Listed pendant-type luminaires or pendant cords shall be permitted.

**(D) Bathtub and Shower Luminaires.** Where a luminaire is installed over a bathtub or in a shower stall, it shall be of the enclosed and gasketed type listed for wet locations.

#### 550.15 Wiring Methods and Materials

Except as specifically limited in this section, the wiring methods and materials included in this *Code* shall be used in mobile homes. Aluminum conductors, aluminum alloy conductors, and aluminum core conductors such as copper-clad aluminum shall not be acceptable for use as branch-circuit wiring.

**(A) Nonmetallic Boxes.** Nonmetallic boxes shall be permitted only with nonmetallic cable or nonmetallic raceways.

**(B) Nonmetallic Cable Protection.** Nonmetallic cable located 380 mm (15 in.) or less above the floor, if exposed, shall be protected from physical damage by covering boards, guard strips, or raceways. Cable likely to be damaged by stowage shall be so protected in all cases.

**(C) Metal-Covered and Nonmetallic Cable Protection.** Metal-covered and nonmetallic cables shall be permitted to pass through the centers of the wide side of 2 by 4 studs. However, they shall be protected where they pass through 2 by 2 studs or at other studs or frames where the cable or armor would be less than 32 mm (1¼ in.) from the inside or outside surface of the studs where the wall covering materials are in contact with the studs. Steel plates on each side of the cable, or a tube, with not less than 1.35 mm (0.053 in.) wall thickness shall be required to protect the cable. These plates or tubes shall be securely held in place.

**(D) Metal Faceplates.** Where metal faceplates are used, they shall be grounded.

**(E) Installation Requirements.** Where a range, clothes dryer, or other appliance is connected by metal-covered cable or flexible metal conduit, a length of not less than 900 mm (3 ft) of unsupported cable or conduit shall be provided to service the appliance. The cable or flexible metal conduit shall be secured to the wall. Type NM or Type SE cable shall not be used to connect a range or dryer. This shall not prohibit the use of Type NM or Type SE cable between the branch-circuit overcurrent protective device and a junction box or range or dryer receptacle.

**(F) Raceways.** Where rigid metal conduit or intermediate metal conduit is terminated at an enclosure with a locknut and bushing connection, two locknuts shall be provided, one inside and one outside of the enclosure. Rigid nonmetallic conduit, electrical nonmetallic tubing, or surface raceway shall be permitted. All cut ends of conduit and tubing shall be reamed or otherwise finished to remove rough edges.

**(G) Switches.** Switches shall be rated as follows:

- (1) For lighting circuits, switches shall be rated not less than 10 amperes, 120 to 125 volts, and in no case less than the connected load.
- (2) Switches for motor or other loads shall comply with the provisions of 404.14.

**(H) Under-Chassis Wiring (Exposed to Weather).** Where outdoor or under-chassis line-voltage (120 volts, nominal, or higher) wiring is exposed to moisture or physical damage, it shall be protected by rigid metal conduit or intermediate metal conduit, except as provided in (1) or (2). The conductors shall be suitable for wet locations.

- (1) Where closely routed against frames and equipment enclosures, reinforced thermosetting resin conduit (RTRC) listed for aboveground use, Type MI cable, electrical metallic tubing, or rigid polyvinyl chloride conduit (PVC) shall be permitted.
- (2) Where extending vertically from a direct-burial depth of at least 457 mm (18 in.) below grade and terminated to a factory-installed conduit or enclosure, Schedule 80 PVC or RTRC listed for exposure to physical damage.

Two provisions allow for installation of under-chassis wiring in other than rigid or intermediate conduit. The first, which was previously an exception, requires the raceway or cable to be installed closely to the frame. Only polyvinyl chloride conduit (PVC) or reinforced thermosetting resin conduit (RTRC) types of rigid nonmetallic conduit are permitted. The second provision allows for the standard prac-

tice of manufactured home construction where a section of PVC or RTRC extends from the inside panelboard to the exterior for connection to the feeder conduit.

**(I) Boxes, Fittings, and Cabinets.** Boxes, fittings, and cabinets shall be securely fastened in place and shall be supported from a structural member of the home, either directly or by using a substantial brace.

*Exception: Snap-in-type boxes. Boxes provided with special wall or ceiling brackets and wiring devices with integral enclosures that securely fasten to walls or ceilings and are identified for the use shall be permitted without support from a structural member or brace. The testing and approval shall include the wall and ceiling construction systems for which the boxes and devices are intended to be used.*

**(J) Appliance Terminal Connections.** Appliances having branch-circuit terminal connections that operate at temperatures higher than 60°C (140°F) shall have circuit conductors as described in the following:

- (1) Branch-circuit conductors having an insulation suitable for the temperature encountered shall be permitted to be run directly to the appliance.
- (2) Conductors having an insulation suitable for the temperature encountered shall be run from the appliance terminal connection to a readily accessible outlet box placed at least 300 mm (1 ft) from the appliance. These conductors shall be in a suitable raceway or Type AC or MC cable of at least 450 mm (18 in.) but not more than 1.8 m (6 ft) in length.

**(K) Component Interconnections.** Fittings and connectors that are intended to be concealed at the time of assembly shall be listed and identified for the interconnection of building components. Such fittings and connectors shall be equal to the wiring method employed in insulation, temperature rise, and fault-current withstanding and shall be capable of enduring the vibration and shock occurring in mobile home transportation.

Informational Note: See 550.19 for interconnection of multiple section units.

## 550.16 Grounding

Grounding of both electrical and nonelectrical metal parts in a mobile home shall be through connection to a grounding bus in the mobile home distribution panelboard and shall be connected through the green-colored insulated conductor in the supply cord or the feeder wiring to the grounding bus in the service-entrance equipment located adjacent to the mobile home location. Neither the frame of the mobile home

nor the frame of any appliance shall be connected to the grounded circuit conductor in the mobile home. Where the distribution panelboard is the service equipment as permitted by 550.32(B), the neutral conductors and the equipment grounding bus shall be connected.

#### (A) Grounded Conductor.

(1) **Insulated.** The grounded circuit conductor shall be insulated from the grounding conductors and from equipment enclosures and other grounded parts. The grounded circuit conductor terminals in the distribution panelboard and in ranges, clothes dryers, counter-mounted cooking units, and wall-mounted ovens shall be insulated from the equipment enclosure. Bonding screws, straps, or buses in the distribution panelboard or in appliances shall be removed and discarded. Where the distribution panelboard is the service equipment as permitted by 550.32(B), the neutral conductors and the equipment grounding bus shall be connected.

(2) **Connections of Ranges and Clothes Dryers.** Connections of ranges and clothes dryers with 120/240-volt, 3-wire ratings shall be made with 4-conductor cord and 3-pole, 4-wire, grounding-type plugs or by Type AC cable, Type MC cable, or conductors enclosed in flexible metal conduit.

In accordance with 550.33(A), the feeder assembly must consist of a listed cord or four color-coded insulated conductors, one of which is the grounded conductor (white) and one of which is used for grounding purposes (green). Thus, the grounded and grounding conductors are kept independent of each other and are connected only at the service equipment (at the point of connection of the grounding electrode conductor). Grounding of both electrical and nonelectrical metal parts, including the frame of the mobile home or the frame of any appliance, is accomplished by connection to the equipment grounding bus [never to the grounded conductor (neutral bus)]. The purpose of this requirement is to prevent incidental contact between the grounded conductor and non-current-carrying metal parts of electrical equipment. Without the separation of the grounded and grounding conductors, this contact could result in the metal structure or metal sheathing of the mobile home becoming a parallel path for neutral current.

Bonding screws, straps, or buses, which bond the grounded (neutral) circuit conductors to the non-current-carrying metal parts in the mobile home panelboard or to the metal frame of an appliance (ranges, clothes dryers), must not be installed or, in the case of ranges and clothes dryers, must be removed. In general, new ranges and clothes dryers have a factory-installed bonding jumper. Removal of the factory-installed bonding jumper does not compromise or void the listing of the product, because isolation of the metal

appliance frame from the grounded circuit conductor is required by the *Code*. There is limited application in existing branch circuits of conventional or “site-built” construction where the factory-installed bonding jumper can remain intact.

#### (B) Equipment Grounding Means.

(1) **Supply Cord or Permanent Feeder.** The green-colored insulated grounding wire in the supply cord or permanent feeder wiring shall be connected to the grounding bus in the distribution panelboard or disconnecting means.

(2) **Electrical System.** In the electrical system, all exposed metal parts, enclosures, frames, luminaire canopies, and so forth shall be effectively bonded to the grounding terminal or enclosure of the distribution panelboard.

(3) **Cord-Connected Appliances.** Cord-connected appliances, such as washing machines, clothes dryers, and refrigerators, and the electrical system of gas ranges and so forth, shall be grounded by means of a cord with an equipment grounding conductor and grounding-type attachment plug.

#### (C) Bonding of Non-Current-Carrying Metal Parts.

(1) **Exposed Non-Current-Carrying Metal Parts.** All exposed non-current-carrying metal parts that are likely to become energized shall be effectively bonded to the grounding terminal or enclosure of the distribution panelboard. A bonding conductor shall be connected between the distribution panelboard and accessible terminal on the chassis.

(2) **Grounding Terminals.** Grounding terminals shall be of the solderless type and listed as pressure-terminal connectors recognized for the wire size used. The bonding conductor shall be solid or stranded, insulated or bare, and shall be 8 AWG copper minimum, or equivalent. The bonding conductor shall be routed so as not to be exposed to physical damage.

(3) **Metallic Piping and Ducts.** Metallic gas, water, and waste pipes and metallic air-circulating ducts shall be considered bonded if they are connected to the terminal on the chassis [see 550.16(C)(1)] by clamps, solderless connectors, or by suitable grounding-type straps.

(4) **Metallic Roof and Exterior Coverings.** Any metallic roof and exterior covering shall be considered bonded if the following conditions are met:

(1) The metal panels overlap one another and are securely attached to the wood or metal frame parts by metallic fasteners.

- (2) The lower panel of the metallic exterior covering is secured by metallic fasteners at a cross member of the chassis by two metal straps per mobile home unit or section at opposite ends.

The bonding strap material shall be a minimum of 100 mm (4 in.) in width of material equivalent to the skin or a material of equal or better electrical conductivity. The straps shall be fastened with paint-penetrating fittings such as screws and starwashers or equivalent.

550.17 Testing

**(A) Dielectric Strength Test.** The wiring of each mobile home shall be subjected to a 1-minute, 900-volt, dielectric strength test (with all switches closed) between live parts (including neutral conductor) and the mobile home ground. Alternatively, the test shall be permitted to be performed at 1080 volts for 1 second. This test shall be performed after branch circuits are complete and after luminaires or appliances are installed.

*Exception: Listed luminaires or appliances shall not be required to withstand the dielectric strength test.*

**(B) Continuity and Operational Tests and Polarity Checks.** Each mobile home shall be subjected to all of the following:

- (1) An electrical continuity test to ensure that all exposed electrically conductive parts are properly bonded
- (2) An electrical operational test to demonstrate that all equipment, except water heaters and electric furnaces, is connected and in working order
- (3) Electrical polarity checks of permanently wired equipment and receptacle outlets to determine that connections have been properly made

550.18 Calculations

The following method shall be employed in calculating the supply-cord and distribution-panelboard load for each feeder assembly for each mobile home in lieu of the procedure shown in Article 220 and shall be based on a 3-wire, 120/240-volt supply with 120-volt loads balanced between the two ungrounded conductors of the 3-wire system.

(A) Lighting, Small-Appliance, and Laundry Load.

**(1) Lighting Volt-Amperes.** Length times width of mobile home floor (outside dimensions) times 33 volt-amperes/m<sup>2</sup> (3 VA/ft<sup>2</sup>), for example, length × width × 3 = lighting volt-amperes.

**(2) Small-Appliance Volt-Amperes.** Number of circuits times 1500 volt-amperes for each 20-ampere appliance receptacle circuit (see definition of *Appliance, Portable*, with a

fine print note in 550.2), for example, number of circuits × 1500 = small-appliance volt-amperes.

**(3) Laundry Area Circuit Volt-Amperes.** 1500 volt-amperes.

**(4) Total Volt-Amperes.** Lighting volt-amperes plus small-appliance volt-amperes plus laundry area volt-amperes equals total volt-amperes.

**(5) Net Volt-Amperes.** First 3000 total volt-amperes at 100 percent plus remainder at 35 percent equals volt-amperes to be divided by 240 volts to obtain current (amperes) per leg.

**(B) Total Load for Determining Power Supply.** Total load for determining power supply is the sum of the following:

- (1) Lighting and small-appliance load as calculated in 550.18(A)(5).
- (2) Nameplate amperes for motors and heater loads (exhaust fans, air conditioners, electric, gas, or oil heating). Omit smaller of the heating and cooling loads, except include blower motor if used as air-conditioner evaporator motor. Where an air conditioner is not installed and a 40-ampere power-supply cord is provided, allow 15 amperes per leg for air conditioning.
- (3) Twenty-five percent of current of largest motor in (2).
- (4) Total of nameplate amperes for waste disposer, dishwasher, water heater, clothes dryer, wall-mounted oven, cooking units. Where the number of these appliances exceeds three, use 75 percent of total.
- (5) Derive amperes for freestanding range (as distinguished from separate ovens and cooking units) by dividing the following values by 240 volts:

Nameplate Rating (watts)	Use (volt-amperes)
0 – 10,000	80 percent of rating
Over 10,000 – 12,500	8,000
Over 12,500 – 13,500	8,400
Over 13,500 – 14,500	8,800
Over 14,500 – 15,500	9,200
Over 15,500 – 16,500	9,600
Over 16,500 – 17,500	10,000

- (6) If outlets or circuits are provided for other than factory-installed appliances, include the anticipated load.

Informational Note: Refer to Informative Annex D, Example D11, for an illustration of the application of this calculation.

**(C) Optional Method of Calculation for Lighting and Appliance Load.** The optional method for calculating lighting and appliance load shown in 220.82 shall be permitted.

### 550.19 Interconnection of Multiple-Section Mobile or Manufactured Home Units

(A) **Wiring Methods.** Approved and listed fixed-type wiring methods shall be used to join portions of a circuit that must be electrically joined and are located in adjacent sections after the home is installed on its support foundation. The circuit's junction shall be accessible for disassembly when the home is prepared for relocation.

Informational Note: See 550.15(K) for component interconnections.

(B) **Disconnecting Means.** Expandable or multiunit manufactured homes, not having permanently installed feeders, that are to be moved from one location to another shall be permitted to have disconnecting means with branch-circuit protective equipment in each unit when so located that after assembly or joining together of units, the requirements of 550.10 will be met.

### 550.20 Outdoor Outlets, Luminaires, Air-Cooling Equipment, and So Forth

(A) **Listed for Outdoor Use.** Outdoor luminaires and equipment shall be listed for wet locations or outdoor use. Outdoor receptacles shall comply with 406.9. Where located on the underside of the home or located under roof extensions or similarly protected locations, outdoor luminaires and equipment shall be listed for use in damp locations.

See the commentary following 406.9 for information on receptacles in damp or wet outdoor locations.

(B) **Outside Heating Equipment, Air-Conditioning Equipment, or Both.** A mobile home provided with a branch circuit designed to energize outside heating equipment, air-conditioning equipment, or both, located outside the mobile home, other than room air conditioners, shall have such branch-circuit conductors terminate in a listed outlet box, or disconnecting means, located on the outside of the mobile home. A label shall be permanently affixed adjacent to the outlet box and shall contain the following information:

THIS CONNECTION IS FOR HEATING  
AND/OR AIR-CONDITIONING EQUIPMENT.  
THE BRANCH CIRCUIT IS RATED AT NOT  
MORE THAN \_\_\_\_ AMPERES, AT  
\_\_\_\_ VOLTS, 60 HERTZ,  
\_\_\_\_ CONDUCTOR AMPACITY.  
A DISCONNECTING MEANS SHALL BE LO-  
CATED WITHIN SIGHT OF THE EQUIPMENT.

The correct voltage and ampere rating shall be given. The tag shall be not less than 0.51 mm (0.020 in.) thick etched brass, stainless steel, anodized or alclad aluminum,

or equivalent. The tag shall not be less than 75 mm by 45 mm (3 in. by 1¾ in.) minimum size.

### 550.25 Arc-Fault Circuit-Interrupter Protection

(A) **Definition.** Arc-fault circuit interrupters are defined in Article 100.

(B) **Mobile Homes and Manufactured Homes.** All 120-volt branch circuits that supply 15- and 20-ampere outlets installed in family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas of mobile homes and manufactured homes shall comply with 210.12.

The 2011 *Code* has expanded arc-fault circuit-interrupter (AFCI) protection coverage to include several areas in addition to bedrooms. The use of listed combination-type AFCI devices is required because this section references 210.12. The branch circuits covered by this requirement are all those that fall within the voltage and current ratings specified and supply bedroom lighting outlets, receptacle outlets, and other power outlets to which devices or utilization equipment are connected. This requirement does not supersede the current HUD 3280 requirements for factory-installed wiring in manufactured homes.

## III. Services and Feeders

### 550.30 Distribution System

The mobile home park secondary electrical distribution system to mobile home lots shall be single-phase, 120/240 volts, nominal. For the purpose of Part III, where the park service exceeds 240 volts, nominal, transformers and secondary distribution panelboards shall be treated as services.

The distribution systems at mobile home parks must supply 120/240 volts to the mobile home lot. Because appliances and other equipment, nominally rated 120/240 volts, are usually installed during the manufacturing process of mobile homes, the home is intended to connect to a 120/240 volt, 3-wire ac, grounded neutral system. A 120/208-volt supply derived from a 4-wire, 120/208-volt wye system is unsuitable.

### 550.31 Allowable Demand Factors

Park electrical wiring systems shall be calculated (at 120/240 volts) on the larger of the following:

- (1) 16,000 volt-amperes for each mobile home lot
- (2) The load calculated in accordance with 550.18 for the largest typical mobile home that each lot will accept

It shall be permissible to calculate the feeder or service load in accordance with Table 550.31. No demand factor shall be allowed for any other load, except as provided in this *Code*.

Park electrical wiring systems must be calculated on the basis of the larger of (1) not less than 16,000 volt-amperes (at 120/240 volts) for each mobile home lot or (2) the calculated load of the largest typical mobile home the lot will accommodate. However, the ampacity of the feeder-circuit conductors to each mobile home lot cannot be less than 100 amperes (at 120/240 volts), per 550.33(B).

**TABLE 550.31 Demand Factors for Services and Feeders**

Number of Mobile Homes	Demand Factor (%)
1	100
2	55
3	44
4	39
5	33
6	29
7–9	28
10–12	27
13–15	26
16–21	25
22–40	24
41–60	23
61 and over	22

### 550.32 Service Equipment

**(A) Mobile Home Service Equipment.** The mobile home service equipment shall be located adjacent to the mobile home and not mounted in or on the mobile home. The service equipment shall be located in sight from and not more than 9.0 m (30 ft) from the exterior wall of the mobile home it serves. The service equipment shall be permitted to be located elsewhere on the premises, provided that a disconnecting means suitable for use as service equipment is located within sight from and not more than 9.0 m (30 ft) from the exterior wall of the mobile home it serves and is rated not less than that required for service equipment in accordance with 550.32(C). Grounding at the disconnecting means shall be in accordance with 250.32.

Mobile home service equipment must be located in sight of the mobile home, but the equipment can be up to 30 ft from any point on the exterior wall of the mobile home. This requirement recognizes the use of feeder raceways that are ex-

ternal to the mobile home. Service equipment may be located more than 30 ft from the mobile home if an additional disconnecting means is located within 30 ft of the mobile home and grounding and bonding of this additional disconnecting means are performed in accordance with the requirements of 250.32. In a mobile home park, this arrangement facilitates locating service equipment at one or more centralized locations that are not within the required 30-ft proximity to the mobile home. Feeders are installed from this service equipment to the properly located mobile home site disconnecting means.

**(B) Manufactured Home Service Equipment.** The manufactured home service equipment shall be permitted to be installed in or on a manufactured home, provided that all of the following conditions are met:

- (1) The manufacturer shall include in its written installation instructions information indicating that the home shall be secured in place by an anchoring system or installed on and secured to a permanent foundation.
- (2) The installation of the service shall comply with Part I through Part VII of Article 230.
- (3) Means shall be provided for the connection of a grounding electrode conductor to the service equipment and routing it outside the structure.
- (4) Bonding and grounding of the service shall be in accordance with Part I through Part V of Article 250.
- (5) The manufacturer shall include in its written installation instructions one method of grounding the service equipment at the installation site. The instructions shall clearly state that other methods of grounding are found in Article 250.
- (6) The minimum size grounding electrode conductor shall be specified in the instructions.
- (7) A red warning label shall be mounted on or adjacent to the service equipment. The label shall state the following:

**WARNING**  
DO NOT PROVIDE ELECTRICAL POWER  
UNTIL THE GROUNDING ELECTRODE(S)  
IS INSTALLED AND CONNECTED  
(SEE INSTALLATION INSTRUCTIONS).

Where the service equipment is not installed in or on the unit, the installation shall comply with the other provisions of this section.

Section 550.32(B) specifies the conditions required for installing the service equipment in or on a manufactured home. The concern over the unit being moved off site (intentionally or unintentionally) without the ability to disconnect

the electrical supply is addressed in condition (1). A manufactured home with a service in or on the unit must be anchored in place or secured to a permanent foundation.

The other specified conditions cover the need to provide proper grounding and bonding conductors, systems, and connections and to install the service equipment in accordance with the applicable requirements in Article 230. The provisions of 550.32(B) apply only to manufactured homes as defined in 550.2.

**(C) Rating.** Mobile home service equipment shall be rated at not less than 100 amperes at 120/240 volts, and provisions shall be made for connecting a mobile home feeder assembly by a permanent wiring method. Power outlets used as mobile home service equipment shall also be permitted to contain receptacles rated up to 50 amperes with appropriate overcurrent protection. Fifty-ampere receptacles shall conform to the configuration shown in Figure 550.10(C).

Informational Note: Complete details of the 50-ampere plug and receptacle configuration can be found in ANSI/NEMA WD 6-1989, National Electrical Manufacturers Association, *Standard for Wiring Devices — Dimensional Requirements*, Figure 14-50.

**(D) Additional Outside Electrical Equipment.** Means for connecting a mobile home accessory building or structure or additional electrical equipment located outside a mobile home by a fixed wiring method shall be provided in either the mobile home service equipment or the local external disconnecting means permitted in 550.32(A).

**(E) Additional Receptacles.** Additional receptacles shall be permitted for connection of electrical equipment located outside the mobile home, and all such 125-volt, single-phase, 15- and 20-ampere receptacles shall be protected by a listed ground-fault circuit interrupter.

**(F) Mounting Height.** Outdoor mobile home disconnecting means shall be installed so the bottom of the enclosure containing the disconnecting means is not less than 600 mm (2 ft) above finished grade or working platform. The disconnecting means shall be installed so that the center of the grip of the operating handle, when in the highest position, is not more than 2.0 m (6 ft 7 in.) above the finished grade or working platform.

**(G) Marking.** Where a 125/250-volt receptacle is used in mobile home service equipment, the service equipment shall be marked as follows:

TURN DISCONNECTING SWITCH OR  
CIRCUIT BREAKER OFF BEFORE INSERTING  
OR REMOVING PLUG. PLUG MUST BE FULLY  
INSERTED OR REMOVED.

The marking shall be located on the service equipment adjacent to the receptacle outlet.

### 550.33 Feeder

**(A) Feeder Conductors.** Feeder conductors shall comply with the following:

- (1) Feeder conductors shall consist of either a listed cord, factory installed in accordance with 550.10(B), or a permanently installed feeder consisting of four insulated, color-coded conductors that shall be identified by the factory or field marking of the conductors in compliance with 310.110. Equipment grounding conductors shall not be identified by stripping the insulation.
- (2) Feeder conductors shall be installed in compliance with 250.32(B).

*Exception: For an existing feeder that is installed between the service equipment and a disconnecting means as covered in 550.32(A), it shall be permitted to omit the equipment grounding conductor where the grounded circuit conductor is grounded at the disconnecting means in accordance with 250.32(B) Exception.*

**(B) Feeder Capacity.** Mobile home and manufactured home lot feeder circuit conductors shall have a capacity not less than the loads supplied, shall be rated at not less than 100 amperes, and shall be permitted to be sized in accordance with 310.15(B)(7).

## I. General

### 551.1 Scope

The provisions of this article cover the electrical conductors and equipment other than low-voltage and automotive vehicle circuits or extensions thereof, installed within or on recreational vehicles, the conductors that connect recreational vehicles to a supply of electricity, and the installation of equipment and devices related to electrical installations within a recreational vehicle park.

Laws in many states require a factory inspection of recreational vehicles by either a governmental or a private inspection agency. NFPA 1192, *Standard on Recreational Vehicles*, is widely accepted by the recreational vehicle (RV) industry and those authorities having jurisdiction responsible for ensuring that RVs are built to a recognized safety standard. Section 4.4 of NFPA 1192-2008 requires compliance with Parts I, III, IV, V, and VI of Article 551 and requires compliance with ANSI/RVIA 12V, *Low Voltage Systems in Conversion and Recreational Vehicles*, for the RV electrical systems rated 24 volts, nominal, or less.

**Informational Note:** For information on low-voltage systems, refer to NFPA 1192-2008, *Standard on Recreational Vehicles*, and ANSI/RVIA 12V-2005, *Standard for Low Voltage Systems in Conversion and Recreational Vehicles*.

### 551.2 Definitions

(See Article 100 for additional definitions.)

**Air-Conditioning or Comfort-Cooling Equipment.** All of that equipment intended or installed for the purpose of processing the treatment of air so as to control simultaneously or individually its temperature, humidity, cleanliness, and distribution to meet the requirements of the conditioned space.

**Appliance, Fixed.** An appliance that is fastened or otherwise secured at a specific location.

**Appliance, Portable.** An appliance that is actually moved or can easily be moved from one place to another in normal use.

**Informational Note:** For the purpose of this article, the following major appliances, other than built-in, are considered portable if cord connected: refrigerators, range equipment, clothes washers, dishwashers without booster heaters, or other similar appliances.

**Appliance, Stationary.** An appliance that is not easily moved from one place to another in normal use.

**Camping Trailer.** A vehicular portable unit mounted on wheels and constructed with collapsible partial side walls that fold for towing by another vehicle and unfold at the campsite to provide temporary living quarters for recreational, camping, or travel use. (*See Recreational Vehicle.*)

**Converter.** A device that changes electrical energy from one form to another, as from alternating current to direct current.

**Dead Front (as applied to switches, circuit breakers, switchboards, and distribution panelboards).** Designed, constructed, and installed so that no current-carrying parts are normally exposed on the front.

**Disconnecting Means.** The necessary equipment usually consisting of a circuit breaker or switch and fuses, and their accessories, located near the point of entrance of supply conductors in a recreational vehicle and intended to constitute the means of cutoff for the supply to that recreational vehicle.

**Distribution Panelboard.** A single panel or group of panel units designed for assembly in the form of a single panel, including buses, and with or without switches and/or automatic overcurrent protective devices for the control of light, heat, or power circuits of small individual as well as aggregate capacity; designed to be placed in a cabinet or cutout box placed in or against a wall or partition and accessible only from the front.

**Frame.** Chassis rail and any welded addition thereto of metal thickness of 1.35 mm (0.053 in.) or greater.

**Low Voltage.** An electromotive force rated 24 volts, nominal, or less.

**Motor Home.** A vehicular unit designed to provide temporary living quarters for recreational, camping, or travel use built on or permanently attached to a self-propelled motor vehicle chassis or on a chassis cab or van that is an integral part of the completed vehicle. (*See Recreational Vehicle.*)

**Power-Supply Assembly.** The conductors, including ungrounded, grounded, and equipment grounding conductors, the connectors, attachment plug caps, and all other fittings, grommets, or devices installed for the purpose of delivering energy from the source of electrical supply to the distribution panel within the recreational vehicle.

**Recreational Vehicle.** A vehicular-type unit primarily designed as temporary living quarters for recreational, camping, or travel use, which either has its own motive power or is mounted on or drawn by another vehicle. The basic entities are travel trailer, camping trailer, truck camper, and motor home.

**Recreational Vehicle Park.** A plot of land upon which two or more recreational vehicle sites are located, established, or maintained for occupancy by recreational vehicles of the general public as temporary living quarters for recreation or vacation purposes.

**Recreational Vehicle Site.** A plot of ground within a recreational vehicle park set aside for the accommodation of a recreational vehicle on a temporary basis. It can be used as either a recreational vehicle site or as a camping unit site.

**Recreational Vehicle Site Feeder Circuit Conductors.** The conductors from the park service equipment to the recreational vehicle site supply equipment.

**Recreational Vehicle Site Supply Equipment.** The necessary equipment, usually a power outlet, consisting of a cir-

cuit breaker or switch and fuse and their accessories, located near the point of entrance of supply conductors to a recreational vehicle site and intended to constitute the disconnecting means for the supply to that site.

**Recreational Vehicle Stand.** That area of a recreational vehicle site intended for the placement of a recreational vehicle.

**Travel Trailer.** A vehicular unit, mounted on wheels, designed to provide temporary living quarters for recreational, camping, or travel use, of such size or weight as not to require special highway movement permits when towed by a motorized vehicle, and of gross trailer area less than 30 m<sup>2</sup> (320 ft<sup>2</sup>). (*See Recreational Vehicle.*)

**Truck Camper.** A portable unit constructed to provide temporary living quarters for recreational, travel, or camping use, consisting of a roof, floor, and sides, designed to be loaded onto and unloaded from the bed of a pickup truck. (*See Recreational Vehicle.*)

## 551.4 General Requirements

**(A) Not Covered.** A recreational vehicle not used for the purposes as defined in 551.2 shall not be required to meet the provisions of Part IV pertaining to the number or capacity of circuits required. It shall, however, meet all other applicable requirements of this article if the recreational vehicle is provided with an electrical installation intended to be energized from a 120-volt, 208Y/120-volt, or 120/240-volt, nominal, ac power-supply system.

**(B) Systems.** This article covers combination electrical systems, generator installations, and 120-volt, 208Y/120-volt, or 120/240-volt, nominal, systems.

Informational Note: For information on low-voltage systems, refer to NFPA 1192-2008, *Standard on Recreational Vehicles*, and ANSI/RVIA 12V-2005, *Standard for Low Voltage Systems in Conversion and Recreational Vehicles*.

## II. Combination Electrical Systems

### 551.20 Combination Electrical Systems

**(A) General.** Vehicle wiring suitable for connection to a battery or dc supply source shall be permitted to be connected to a 120-volt source, provided the entire wiring system and equipment are rated and installed in full conformity with Parts I, II, III, IV, and V requirements of this article covering 120-volt electrical systems. Circuits fed from ac transformers shall not supply dc appliances.

**(B) Voltage Converters (120-Volt Alternating Current to Low-Voltage Direct Current).** The 120-volt ac side of the voltage converter shall be wired in full conformity with

Parts I, II, III, IV, and V requirements of this article for 120-volt electrical systems.

*Exception: Converters supplied as an integral part of a listed appliance shall not be subject to 551.20(B).*

All converters and transformers shall be listed for use in recreational vehicles and designed or equipped to provide overtemperature protection. To determine the converter rating, the following percentages shall be applied to the total connected load, including average battery-charging rate, of all 12-volt equipment:

- The first 20 amperes of load at 100 percent plus
- The second 20 amperes of load at 50 percent plus
- All load above 40 amperes at 25 percent

*Exception: A low-voltage appliance that is controlled by a momentary switch (normally open) that has no means for holding in the closed position or refrigerators with a 120-volt function shall not be considered as a connected load when determining the required converter rating. Momentarily energized appliances shall be limited to those used to prepare the vehicle for occupancy or travel.*

**(C) Bonding Voltage Converter Enclosures.** The non-current-carrying metal enclosure of the voltage converter shall be connected to the frame of the vehicle with a minimum 8 AWG copper conductor. The voltage converter shall be provided with a separate chassis bonding conductor that shall not be used as a current-carrying conductor.

The intent of 551.20(C) is to reduce the possibility of damage to the power-supply cord by large dc fault currents that may find their way back to the vehicle frame or battery through the ac grounding conductor of the converter. Metal enclosures of listed converters are provided with an external pressure terminal connector for this purpose.

**(D) Dual-Voltage Fixtures, Including Luminaires or Appliances.** Fixtures, including luminaires, or appliances having both 120-volt and low-voltage connections shall be listed for dual voltage.

In the dual-voltage fixtures, barriers are used to separate the 120-volt and the 12-volt wiring connections.

**(E) Autotransformers.** Autotransformers shall not be used.

**(F) Receptacles and Plug Caps.** Where a recreational vehicle is equipped with an ac system, a low-voltage system, or both, receptacles and plug caps of the low-voltage system

shall differ in configuration from those of the ac system. Where a vehicle equipped with a battery or other low-voltage system has an external connection for low-voltage power, the connector shall have a configuration that will not accept ac power.

### III. Other Power Sources

#### 551.30 Generator Installations

**(A) Mounting.** Generators shall be mounted in such a manner as to be effectively bonded to the recreational vehicle chassis.

**(B) Generator Protection.** Equipment shall be installed to ensure that the current-carrying conductors from the engine generator and from an outside source are not connected to a vehicle circuit at the same time. Automatic transfer switches in such applications shall be listed for use in one of the following:

- (1) Emergency systems
- (2) Optional standby systems

Receptacles used as disconnecting means shall be accessible (as applied to wiring methods) and capable of interrupting their rated current without hazard to the operator.

**(C) Installation of Storage Batteries and Generators.** Storage batteries and internal-combustion-driven generator units (subject to the provisions of this *Code*) shall be secured in place to avoid displacement from vibration and road shock.

**(D) Ventilation of Generator Compartments.** Compartments accommodating internal-combustion-driven generator units shall be provided with ventilation in accordance with instructions provided by the manufacturer of the generator unit.

Informational Note: For generator compartment construction requirements, see NFPA 1192-2008, *Standard on Recreational Vehicles*.

**(E) Supply Conductors.** The supply conductors from the engine generator to the first termination on the vehicle shall be of the stranded type and be installed in listed flexible conduit or listed liquidtight flexible conduit. The point of first termination shall be in one of the following:

- (1) Panelboard
- (2) Junction box with a blank cover
- (3) Junction box with a receptacle
- (4) Enclosed transfer switch
- (5) Receptacle assembly listed in conjunction with the generator

The panelboard or junction box with a receptacle shall be installed within the vehicle's interior and within 450 mm

(18 in.) of the compartment wall but not inside the compartment. If the generator is below the floor level and not in a compartment, the panelboard or junction box with receptacle shall be installed within the vehicle interior within 450 mm (18 in.) of the point of entry into the vehicle. A junction box with a blank cover shall be mounted on the compartment wall and shall be permitted inside or outside the compartment. A receptacle assembly listed in conjunction with the generator shall be mounted in accordance with its listing. If the generator is below floor level and not in a compartment, the junction box with blank cover shall be mounted either to any part of the generator supporting structure (but not to the generator) or to the vehicle floor within 450 mm (18 in.) of any point directly above the generator on either the inside or outside of the floor surface. Overcurrent protection in accordance with 240.4 shall be provided for supply conductors as an integral part of a listed generator or shall be located within 450 mm (18 in.) of their point of entry into the vehicle.

### 551.31 Multiple Supply Source

**(A) Multiple Supply Sources.** Where a multiple supply system consisting of an alternate power source and a power-supply cord is installed, the feeder from the alternate power source shall be protected by an overcurrent protective device. Installation shall be in accordance with 551.30(A), 551.30(B), and 551.40.

**(B) Multiple Supply Sources Capacity.** The multiple supply sources shall not be required to be of the same capacity.

**(C) Alternate Power Sources Exceeding 30 Amperes.** If an alternate power source exceeds 30 amperes, 120 volts, nominal, it shall be permissible to wire it as a 120-volt, nominal, system, a 208Y/120-volt, nominal, system, or a 120/240-volt, nominal, system, provided an overcurrent protective device of the proper rating is installed in the feeder.

**(D) Power-Supply Assembly Not Less Than 30 Amperes.** The external power-supply assembly shall be permitted to be less than the calculated load but not less than 30 amperes and shall have overcurrent protection not greater than the capacity of the external power-supply assembly.

### 551.32 Other Sources

Other sources of ac power, such as inverters, motor generators, or engine generators, shall be listed for use in recreational vehicles and shall be installed in accordance with the terms of the listing. Other sources of ac power shall be wired in full conformity with the requirements in Parts I, II, III, IV, and V of this article covering 120-volt electrical systems.

### 551.33 Alternate Source Restrictions

Transfer equipment, if not integral with the listed power source, shall be installed to ensure that the current-carrying conductors from other sources of ac power and from an outside source are not connected to the vehicle circuit at the same time. Automatic transfer switches in such applications shall be listed for use in one of the following:

- (1) Emergency systems
- (2) Optional standby systems

Automatic transfer switches (ATS) with relays may, under a fault condition such as a relay failure, simultaneously connect multiple sources. Therefore, the ATS must be listed for use in emergency or standby systems.

## IV. Nominal 120-Volt or 120/240-Volt Systems

### 551.40 120-Volt or 120/240-Volt, Nominal, Systems

**(A) General Requirements.** The electrical equipment and material of recreational vehicles indicated for connection to a wiring system rated 120 volts, nominal, 2-wire with equipment grounding conductor, or a wiring system rated 120/240 volts, nominal, 3-wire with equipment grounding conductor, shall be listed and installed in accordance with the requirements of Parts I, II, III, IV, and V of this article. Electrical equipment connected line-to-line shall have a voltage rating of 208–230 volts.

Electrical equipment is required to be rated 208–230 volts when it is to be connected line to line. This rating allows for compatibility with RV parks that have 208Y/120-volt, 3-phase, 4-wire electrical distribution systems.

**(B) Materials and Equipment.** Electrical materials, devices, appliances, fittings, and other equipment installed in, intended for use in, or attached to the recreational vehicle shall be listed. All products shall be used only in the manner in which they have been tested and found suitable for the intended use.

**(C) Ground-Fault Circuit-Interrupter Protection.** The internal wiring of a recreational vehicle having only one 15- or 20-ampere branch circuit as permitted in 551.42(A) and (B) shall have ground-fault circuit-interrupter protection for personnel. The ground-fault circuit interrupter shall be installed at the point where the power supply assembly terminates within the recreational vehicle. Where a separable cord

set is not employed, the ground-fault circuit interrupter shall be permitted to be an integral part of the attachment plug of the power supply assembly. The ground-fault circuit interrupter shall provide protection also under the conditions of an open grounded circuit conductor, interchanged circuit conductors, or both.

### 551.41 Receptacle Outlets Required

**(A) Spacing.** Receptacle outlets shall be installed at wall spaces 600 mm (2 ft) wide or more so that no point along the floor line is more than 1.8 m (6 ft), measured horizontally, from an outlet in that space.

*Exception No. 1: Bath and hallway areas.*

*Exception No. 2: Wall spaces occupied by kitchen cabinets, wardrobe cabinets, built-in furniture, behind doors that may open fully against a wall surface, or similar facilities.*

**(B) Location.** Receptacle outlets shall be installed as follows:

- (1) Adjacent to countertops in the kitchen [at least one on each side of the sink if countertops are on each side and are 300 mm (12 in.) or over in width]
- (2) Adjacent to the refrigerator and gas range space, except where a gas-fired refrigerator or cooking appliance, requiring no external electrical connection, is factory installed
- (3) Adjacent to countertop spaces of 300 mm (12 in.) or more in width that cannot be reached from a receptacle required in 551.41(B)(1) by a cord of 1.8 m (6 ft) without crossing a traffic area, cooking appliance, or sink

**(C) Ground-Fault Circuit-Interrupter Protection.** Where provided, each 125-volt, single-phase, 15- or 20-ampere receptacle outlet shall have ground-fault circuit-interrupter protection for personnel in the following locations:

- (1) Adjacent to a bathroom lavatory

The walls in an RV often do not provide the necessary depth for the installation of a GFCI receptacle. This requirement does not prohibit a bathroom receptacle from being mounted in the side of a lavatory cabinet.

- (2) Where the receptacles are installed to serve the countertop surfaces and are within 1.8 m (6 ft) of any lavatory or sink

*Exception No. 1: Receptacles installed for appliances in dedicated spaces, such as for dishwashers, disposals, refrigerators, freezers, and laundry equipment.*

*Exception No. 2: Single receptacles for interior connections of expandable room sections.*

*Exception No. 3: De-energized receptacles that are within 1.8 m (6 ft) of any sink or lavatory due to the retraction of the expandable room section.*

- (3) In the area occupied by a toilet, shower, tub, or any combination thereof
- (4) On the exterior of the vehicle

*Exception: Receptacles that are located inside of an access panel that is installed on the exterior of the vehicle to supply power for an installed appliance shall not be required to have ground-fault circuit-interrupter protection.*

The receptacle outlet shall be permitted in a listed luminaire. A receptacle outlet shall not be installed in a tub or combination tub–shower compartment.

Receptacles of any type are not permitted in a tub or tub–shower compartment.

**(D) Face-Up Position.** A receptacle shall not be installed in a face-up position in any countertop or similar horizontal surfaces within the living area.

### 551.42 Branch Circuits Required

Each recreational vehicle containing an ac electrical system shall contain one of the circuit arrangements in 551.42(A) through (D).

**(A) One 15-Ampere Circuit.** One 15-ampere circuit to supply lights, receptacle outlets, and fixed appliances. Such recreational vehicles shall be equipped with one 15-ampere switch and fuse or one 15-ampere circuit breaker.

**(B) One 20-Ampere Circuit.** One 20-ampere circuit to supply lights, receptacle outlets, and fixed appliances. Such recreational vehicles shall be equipped with one 20-ampere switch and fuse or one 20-ampere circuit breaker.

**(C) Two to Five 15- or 20-Ampere Circuits.** A maximum of five 15- or 20-ampere circuits to supply lights, receptacle outlets, and fixed appliances shall be permitted. Such recreational vehicles shall be permitted to be equipped with distribution panelboards rated 120 volts maximum or 120/240 volts maximum and listed for 30-ampere application supplied by the appropriate power-supply assemblies. Not more than two 120-volt thermostatically controlled appliances (e.g., air conditioner and water heater) shall be installed in such systems unless appliance isolation switching, energy management systems, or similar methods are used.

*Exception: Additional 15- or 20-ampere circuits shall be permitted where a listed energy management system rated at 30-ampere maximum is employed within the system.*

Informational Note: See 210.23(A) for permissible loads. See 551.45(C) for main disconnect and overcurrent protection requirements.

**(D) More Than Five Circuits Without a Listed Energy Management System.** A 50-ampere, 120/208–240-volt power-supply assembly and a minimum 50-ampere-rated distribution panelboard shall be used where six or more circuits are employed. The load distribution shall ensure a reasonable current balance between phases.

In RVs with six or more circuits, the power-supply assembly must have a minimum rating of 50 amperes. Reasonable balancing of the electrical load between phases is required. In addition, the panelboard is required to be rated 120/208–240 to allow connection to a 120/240 single-phase service or a 120/208 3-phase distribution. Based on experience and field data, supply calculations, which in some cases have resulted in oversized power supplies, are considered unnecessary.

### 551.43 Branch-Circuit Protection

**(A) Rating.** The branch-circuit overcurrent devices shall be rated as follows:

- (1) Not more than the circuit conductors, and
- (2) Not more than 150 percent of the rating of a single appliance rated 13.3 amperes or more and supplied by an individual branch circuit, but
- (3) Not more than the overcurrent protection size marked on an air conditioner or other motor-operated appliances

**(B) Protection for Smaller Conductors.** A 20-ampere fuse or circuit breaker shall be permitted for protection for fixtures, including luminaires, leads, cords, or small appliances, and 14 AWG tap conductors, not over 1.8 m (6 ft) long for recessed luminaires.

**(C) Fifteen-Ampere Receptacle Considered Protected by 20 Amperes.** If more than one receptacle or load is on a branch circuit, a 15-ampere receptacle shall be permitted to be protected by a 20-ampere fuse or circuit breaker.

### 551.44 Power-Supply Assembly

Each recreational vehicle shall have only one of the main power-supply assemblies covered in 551.44(A) through (D).

**(A) Fifteen-Ampere Main Power-Supply Assembly.** Recreational vehicles wired in accordance with 551.42(A) shall use a listed 15-ampere or larger main power-supply assembly.

**(B) Twenty-Ampere Main Power-Supply Assembly.** Recreational vehicles wired in accordance with 551.42(B) shall use a listed 20-ampere or larger main power-supply assembly.

**(C) Thirty-Ampere Main Power-Supply Assembly.** Recreational vehicles wired in accordance with 551.42(C) shall use a listed 30-ampere or larger main power-supply assembly.

**(D) Fifty-Ampere Power-Supply Assembly.** Recreational vehicles wired in accordance with 551.42(D) shall use a listed 50-ampere, 120/208–240-volt main power-supply assembly.

### 551.45 Distribution Panelboard

**(A) Listed and Appropriately Rated.** A listed and appropriately rated distribution panelboard or other equipment specifically listed for this purpose shall be used. The grounded conductor termination bar shall be insulated from the enclosure as provided in 551.54(C). An equipment grounding terminal bar shall be attached inside the enclosure of the panelboard.

**(B) Location.** The distribution panelboard shall be installed in a readily accessible location with the RV in the setup mode. Working clearance for the panelboard with the RV in the setup mode shall be not less than 600 mm (24 in.) wide and 750 mm (30 in.) deep.

Some RVs have expandable room sections (or slide-out rooms) that are in a stowed position when the vehicle travels from place to place. The specified working clearance in front of equipment in an expanded section must be maintained in the setup mode.

*Exception No. 1: Where the panelboard cover is exposed to the inside aisle space, one of the working clearance dimensions shall be permitted to be reduced to a minimum of 550 mm (22 in.). A panelboard is considered exposed where the panelboard cover is within 50 mm (2 in.) of the aisle's finished surface.*

*Exception No. 2: Compartment doors used for access to a generator shall be permitted to be equipped with a locking system.*

**(C) Dead-Front Type.** The distribution panelboard shall be of the dead-front type and shall consist of one or more circuit breakers or Type S fuseholders. A main disconnecting means shall be provided where fuses are used or where more than two circuit breakers are employed. A main overcurrent protective device not exceeding the power-supply as-

sembly rating shall be provided where more than two branch circuits are employed.

### 551.46 Means for Connecting to Power Supply

**(A) Assembly.** The power-supply assembly or assemblies shall be factory supplied or factory installed and be of one of the types specified herein.

**(1) Separable.** Where a separable power-supply assembly consisting of a cord with a female connector and molded attachment plug cap is provided, the vehicle shall be equipped with a permanently mounted, flanged surface inlet (male, recessed-type motor-base attachment plug) wired directly to the distribution panelboard by an approved wiring method. The attachment plug cap shall be of a listed type.

**(2) Permanently Connected.** Each power-supply assembly shall be connected directly to the terminals of the distribution panelboard or conductors within a junction box and provided with means to prevent strain from being transmitted to the terminals. The ampacity of the conductors between each junction box and the terminals of each distribution panelboard shall be at least equal to the ampacity of the power-supply cord. The supply end of the assembly shall be equipped with an attachment plug of the type described in 551.46(C). Where the cord passes through the walls or floors, it shall be protected by means of conduit and bushings or equivalent. The cord assembly shall have permanent provisions for protection against corrosion and mechanical damage while the vehicle is in transit, or while the cord assembly is being stored or removed for use.

**(B) Cord.** The cord exposed usable length shall be measured from the point of entrance to the recreational vehicle or the face of the flanged surface inlet (motor-base attachment plug) to the face of the attachment plug at the supply end.

The cord exposed usable length, measured to the point of entry on the vehicle exterior, shall be a minimum of 7.5 m (25 ft) where the point of entrance is at the side of the vehicle or shall be a minimum 9.0 m (30 ft) where the point of entrance is at the rear of the vehicle.

Where the cord entrance into the vehicle is more than 900 mm (3 ft) above the ground, the minimum cord lengths above shall be increased by the vertical distance of the cord entrance heights above 900 mm (3 ft).

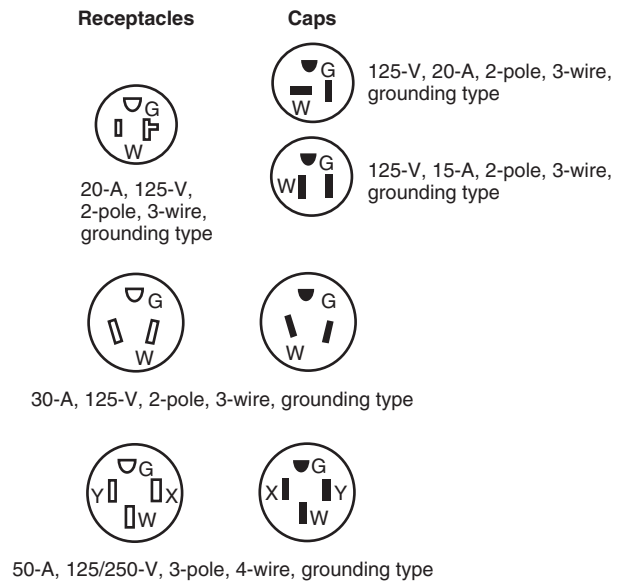

Informational Note: See 551.46(E).

### (C) Attachment Plugs.

**(1) Units with One 15-Ampere Branch Circuit.** Recreational vehicles having only one 15-ampere branch circuit as permitted by 551.42(A) shall have an attachment plug that shall be 2-pole, 3-wire grounding type, rated 15 amperes,

125 volts, conforming to the configuration shown in Figure 551.46(C).

Informational Note: Complete details of this configuration can be found in ANSI/NEMA WD 6-2002, National Electrical Manufacturers Association's *Standard for Dimensions of Attachment Plugs and Receptacle*, Figure 5.15.

**FIGURE 551.46(C) Configurations for Grounding-Type Receptacles and Attachment Plug Caps Used for Recreational Vehicle Supply Cords and Recreational Vehicle Lots.**

**(2) Units with One 20-Ampere Branch Circuit.** Recreational vehicles having only one 20-ampere branch circuit as permitted in 551.42(B) shall have an attachment plug that shall be 2-pole, 3-wire grounding type, rated 20 amperes, 125 volts, conforming to the configuration shown in Figure 551.46(C).

Informational Note: Complete details of this configuration can be found in ANSI/NEMA WD 6-2002, National Electrical Manufacturers Association's *Standard for Dimensions of Attachment Plugs and Receptacles*, Figure 5.20.

**(3) Units with Two to Five 15- or 20-Ampere Branch Circuits.** Recreational vehicles wired in accordance with 551.42(C) shall have an attachment plug that shall be 2-pole, 3-wire grounding type, rated 30 amperes, 125 volts, conforming to the configuration shown in Figure 551.46(C), intended for use with units rated at 30 amperes, 125 volts.

Informational Note: Complete details of this configuration can be found in ANSI/NEMA WD 6-2002, National Electrical Manufacturers Association's *Standard for Dimensions of Attachment Plugs and Receptacles*, Figure TT.

**(4) Units with 50-Ampere Power-Supply Assembly.** Recreational vehicles having a power-supply assembly rated 50

amperes as permitted by 551.42(D) shall have a 3-pole, 4-wire grounding-type attachment plug rated 50 amperes, 125/250 volts, conforming to the configuration shown in Figure 551.46(C).

**Informational Note:** Complete details of this configuration can be found in ANSI/NEMA WD 6-2002, National Electrical Manufacturers Association's *Standard for Dimensions of Attachment Plugs and Receptacles*, Figure 14.50.

In Figure 551.46(C), the 20- and 50-ampere receptacle and plug configurations used for RVs appear in NEMA WD6-2002, *Wiring Devices — Dimensional Requirements*; however, the 30-ampere plug and receptacle configurations are unique to RVs and are described in UL 498, *Standard for Attachment Plugs and Receptacles*.

**(D) Labeling at Electrical Entrance.** Each recreational vehicle shall have permanently affixed to the exterior skin, at or near the point of entrance of the power-supply cord(s), a label 75 mm × 45 mm (3 in. × 1¾ in.) minimum size, made of etched, metal-stamped, or embossed brass, stainless steel, or anodized or alclad aluminum not less than 0.51 mm (0.020 in.) thick, or other suitable material [e.g., 0.13 mm (0.005 in.) thick plastic laminate] that reads, as appropriate, either

THIS CONNECTION IS FOR 110–125-VOLT AC,  
60 HZ, \_\_\_\_ AMPERE SUPPLY.

or

THIS CONNECTION IS FOR 208Y/120-VOLT  
or 120/240-VOLT AC, 3-POLE, 4-WIRE,  
60 HZ, \_\_\_\_ AMPERE SUPPLY.

The correct ampere rating shall be marked in the blank space.

**(E) Location.** The point of entrance of a power-supply assembly shall be located within 4.5 m (15 ft) of the rear, on the left (road) side or at the rear, left of the longitudinal center of the vehicle, within 450 mm (18 in.) of the outside wall.

*Exception No. 1: A recreational vehicle equipped with only a listed flexible drain system or a side-vent drain system shall be permitted to have the electrical point of entrance located on either side, provided the drain(s) for the plumbing system is (are) located on the same side.*

*Exception No. 2: A recreational vehicle shall be permitted to have the electrical point of entrance located more than 4.5 m (15 ft) from the rear. Where this occurs, the distance beyond the 4.5-m (15-ft) dimension shall be added to the cord's minimum length as specified in 551.46(B).*

*Exception No. 3: Recreational vehicles designed for transporting livestock shall be permitted to have the electrical point of entrance located on either side or the front.*

Exception No. 3 gives permission to locate the power supply entrance on either side or the front of an RV that also has provisions for transporting livestock.

## 551.47 Wiring Methods

**(A) Wiring Systems.** Cables and raceways installed in accordance with Articles 320, 322, 330 through 340, 342 through 362, 386, and 388 shall be permitted in accordance with their applicable article, except as otherwise specified in this article. An equipment grounding means shall be provided in accordance with 250.118.

See the commentary on 348.60 for information regarding the use of flexible metal conduit as an equipment grounding conductor.

**(B) Conduit and Tubing.** Where rigid metal conduit or intermediate metal conduit is terminated at an enclosure with a locknut and bushing connection, two locknuts shall be provided, one inside and one outside of the enclosure. All cut ends of conduit and tubing shall be reamed or otherwise finished to remove rough edges.

See the commentary following 344.28, 358.28(A), and 300.4(G), which cover the protection of conductor insulation against abrasion at conduit and tubing terminations.

**(C) Nonmetallic Boxes.** Nonmetallic boxes shall be acceptable only with nonmetallic-sheathed cable or nonmetallic raceways.

**(D) Boxes.** In walls and ceilings constructed of wood or other combustible material, boxes and fittings shall be flush with the finished surface or project therefrom.

**(E) Mounting.** Wall and ceiling boxes shall be mounted in accordance with Article 314.

*Exception No. 1: Snap-in-type boxes or boxes provided with special wall or ceiling brackets that securely fasten boxes in walls or ceilings shall be permitted.*

*Exception No. 2: A wooden plate providing a 38-mm (1½ in.) minimum width backing around the box and of a thickness of 13 mm (½ in.) or greater (actual) attached directly to the wall panel shall be considered as approved means for mounting outlet boxes.*

Exception No. 2 permits the mounting of outlet boxes by screws to a wooden plate that is secured directly to the back of the wall panel. The wooden plate must be not less than ½ in. thick and must extend at least 1½ in. around the box. This requirement recognizes the special construction of RV walls, which often makes it difficult or impossible to attach an outlet box to a structural member, as required by 314.23(B).

**(F) Raceway and Cable Continuity.** Raceways and cable sheaths shall be continuous between boxes and other enclosures.

**(G) Protected.** Metal-clad, Type AC, or nonmetallic-sheathed cables and electrical nonmetallic tubing shall be permitted to pass through the centers of the wide side of 2 by 4 wood studs. However, they shall be protected where they pass through 2 by 2 wood studs or at other wood studs or frames where the cable or tubing would be less than 32 mm (1¼ in.) from the inside or outside surface. Steel plates on each side of the cable or tubing or a steel tube, with not less than 1.35 mm (0.053 in.) wall thickness, shall be installed to protect the cable or tubing. These plates or tubes shall be securely held in place. Where nonmetallic-sheathed cables pass through punched, cut, or drilled slots or holes in metal members, the cable shall be protected by bushings or grommets securely fastened in the opening prior to installation of the cable.

**(H) Bends.** No bend shall have a radius of less than five times the cable diameter.

**(I) Cable Supports.** Where connected with cable connectors or clamps, cables shall be supported within 300 mm (12 in.) of outlet boxes, distribution panelboards, and splice boxes on appliances. Supports shall be provided at intervals not exceeding 1.4 m (4½ ft) at other places.

**(J) Nonmetallic Box Without Cable Clamps.** Nonmetallic-sheathed cables shall be supported within 200 mm (8 in.) of a nonmetallic outlet box without cable clamps. Where wiring devices with integral enclosures are employed with a loop of extra cable to permit future replacement of the device, the cable loop shall be considered as an integral portion of the device.

**(K) Physical Damage.** Where subject to physical damage, exposed nonmetallic cable shall be protected by covering boards, guard strips, raceways, or other means.

**(L) Receptacle Faceplates.** Metal faceplates shall comply with Section 406.5(A). Nonmetallic faceplates shall comply with Section 406.5(C).

**(M) Metal Faceplates Grounded.** Where metal faceplates are used, they shall be grounded.

**(N) Moisture or Physical Damage.** Where outdoor or under-chassis wiring is 120 volts, nominal, or over and is exposed to moisture or physical damage, the wiring shall be protected by rigid metal conduit, by intermediate metal conduit, or by electrical metallic tubing, rigid nonmetallic conduit, or Type MI cable, that is closely routed against frames and equipment enclosures or other raceway or cable identified for the application.

**(O) Component Interconnections.** Fittings and connectors that are intended to be concealed at the time of assembly shall be listed and identified for the interconnection of building components. Such fittings and connectors shall be equal to the wiring method employed in insulation, temperature rise, and fault-current withstanding and shall be capable of enduring the vibration and shock occurring in recreational vehicles.

**(P) Method of Connecting Expandable Units.** The method of connecting expandable units to the main body of the vehicle shall comply with 551.47(P)(1) or (P)(2):

**(1) Cord-and-Plug-Connected.** Cord-and-plug connections shall comply with (a) through (d).

(a) That portion of a branch circuit that is installed in an expandable unit shall be permitted to be connected to the portion of the branch circuit in the main body of the vehicle by means of an attachment plug and cord listed for hard usage. The cord and its connections shall comply with all provisions of Article 400 and shall be considered as a permitted use under 400.7. Where the attachment plug and cord are located within the vehicle's interior, use of plastic thermoset or elastomer parallel cord Type SPT-3, SP-3, or SPE shall be permitted.

(b) Where the receptacle provided for connection of the cord to the main circuit is located on the outside of the vehicle, it shall be protected with a ground-fault circuit interrupter for personnel and be listed for wet locations. A cord located on the outside of a vehicle shall be identified for outdoor use.

(c) Unless removable or stored within the vehicle interior, the cord assembly shall have permanent provisions for protection against corrosion and mechanical damage while the vehicle is in transit.

(d) The attachment plug and cord shall be installed so as not to permit exposed live attachment plug pins.

**(2) Direct Wired.** That portion of a branch circuit that is installed in an expandable unit shall be permitted to be connected to the portion of the branch circuit in the main body

of the vehicle by means of flexible cord installed in accordance with 551.47(P)(2)(a) through (P)(2)(e) or other approved wiring method.

Section 551.47(P) covers the interconnection between the main body of a vehicle and an expandable unit. Two methods of interconnection are permitted: one by means of cord-and-plug connections with the cord listed for hard usage, the other by means of a direct-wired connection, using flexible cord with the outer jacket intact, installed in nonflexible conduit or tubing. Where subject to physical damage, RMC, IMC, Schedule 80 PVC, RTRC, or other approved means must be used to protect the cord.

(a) The flexible cord shall be listed for hard usage and for use in wet locations.

(b) The flexible cord shall be permitted to be exposed on the underside of the vehicle.

(c) The flexible cord shall be permitted to pass through the interior of a wall or floor assembly or both a maximum concealed length of 600 mm (24 in.) before terminating at an outlet or junction box.

(d) Where concealed, the flexible cord shall be installed in nonflexible conduit or tubing that is continuous from the outlet or junction box inside the recreational vehicle to a weatherproof outlet box, junction box, or strain relief fitting listed for use in wet locations that is located on the underside of the recreational vehicle. The outer jacket of the flexible cord shall be continuous into the outlet or junction box.

(e) Where the flexible cord passes through the floor to an exposed area inside of the recreational vehicle, it shall be protected by means of conduit and bushings or equivalent.

Where subject to physical damage, the flexible cord shall be protected with RMC, IMC, Schedule 80 PVC, reinforced thermosetting resin conduit (RTRC) listed for exposure to physical damage, or other approved means and shall extend at least 150 mm (6 in.) above the floor. A means shall be provided to secure the flexible cord where it enters the recreational vehicle.

**(Q) Prewiring for Air-Conditioning Installation.** Prewiring installed for the purpose of facilitating future air-conditioning installation shall comply with the applicable portions of this article and the following:

- (1) An overcurrent protective device with a rating compatible with the circuit conductors shall be installed in the distribution panelboard and wiring connections completed.
- (2) The load end of the circuit shall terminate in a junction box with a blank cover or other listed enclosure. Where

a junction box with a blank cover is used, the free ends of the conductors shall be adequately capped or taped.

- (3) A label conforming to 551.46(D) shall be placed on or adjacent to the junction box and shall read as follows:

AIR-CONDITIONING CIRCUIT.  
THIS CONNECTION IS FOR AIR CONDITIONERS  
RATED 110–125-VOLT AC,  
60 HZ, \_\_\_\_ AMPERES MAXIMUM.  
DO NOT EXCEED CIRCUIT RATING.

An ampere rating, not to exceed 80 percent of the circuit rating, shall be legibly marked in the blank space.

- (4) The circuit shall serve no other purpose.

**(R) Prewiring for Generator Installation.** Prewiring installed for the purpose of facilitating future generator installation shall comply with the other applicable portions of this article and the following:

- (1) Circuit conductors shall be appropriately sized in relation to the anticipated load as stated on the label required in (R)(4).
- (2) Where junction boxes are utilized at either of the circuit originating or terminus points, free ends of the conductors shall be adequately capped or taped.
- (3) Where devices such as receptacle outlet, transfer switch, and so forth, are installed, the installation shall be complete, including circuit conductor connections. All devices shall be listed and appropriately rated.
- (4) A label conforming to 551.46(D) shall be placed on the cover of each junction box containing incomplete circuitry and shall read, as appropriate, either

**GENERATOR**  
ONLY INSTALL A GENERATOR LISTED  
SPECIFICALLY FOR RV USE  
HAVING OVERCURRENT PROTECTION  
RATED 110/125-VOLT AC,  
60 HZ, \_\_\_\_ AMPERES MAXIMUM.

or

**GENERATOR**  
ONLY INSTALL A GENERATOR LISTED  
SPECIFICALLY FOR RV USE  
HAVING OVERCURRENT PROTECTION  
RATED 120/240-VOLT AC,  
60 HZ, \_\_\_\_ AMPERES MAXIMUM.

The correct ampere rating shall be legibly marked in the blank space.

**(S) Prewiring for Other Circuits.** Prewiring installed for the purpose of installing other appliances or devices shall comply with the applicable portions of this article and the following:

- (1) An overcurrent protection device with a rating compatible with the circuit conductors shall be installed in the distribution panelboard with wiring connections completed.
- (2) The load end of the circuit shall terminate in a junction box with a blank cover or a device listed for the purpose. Where a junction box with blank cover is used, the free ends of the conductors shall be adequately capped or taped.
- (3) A label conforming to 551.46(D) shall be placed on or adjacent to the junction box or device listed for the purpose and shall read as follows:

THIS CONNECTION IS FOR \_\_\_\_ RATED  
\_\_\_\_ VOLT AC, 60 HZ, \_\_\_\_ AMPERES  
MAXIMUM. DO NOT EXCEED CIRCUIT  
RATING.

An ampere rating not to exceed 80 percent of the circuit rating shall be legibly marked in the blank space.

#### 551.48 Conductors and Boxes

The maximum number of conductors permitted in boxes shall be in accordance with 314.16.

#### 551.49 Grounded Conductors

The identification of grounded conductors shall be in accordance with 200.6.

#### 551.50 Connection of Terminals and Splices

Conductor splices and connections at terminals shall be in accordance with 110.14.

#### 551.51 Switches

(A) **Rating.** Switches shall be rated in accordance with 551.51(A)(1) and (A)(2).

(1) **Lighting Circuits.** For lighting circuits, switches shall be rated not less than 10 amperes, 120–125 volts and in no case less than the connected load.

(2) **Motors or Other Loads.** Switches for motor or other loads shall comply with the provisions of 404.14.

(B) **Location.** Switches shall not be installed within wet locations in tub or shower spaces unless installed as part of a listed tub or shower assembly.

#### 551.52 Receptacles

All receptacle outlets shall be of the grounding type and installed in accordance with 406.4 and 210.21.

#### 551.53 Luminaires

(A) **General.** Any combustible wall or ceiling finish exposed between the edge of a luminaire canopy, or pan and

the outlet box, shall be covered with noncombustible material or a material identified for the purpose.

(B) **Shower Luminaires.** If a luminaire is provided over a bathtub or in a shower stall, it shall be of the enclosed and gasketed type and listed for the type of installation, and it shall be ground-fault circuit-interrupter protected.

Due to the low ceilings in RVs, luminaires installed above a tub or shower enclosure may be easily reached by most persons standing in the enclosure, and accordingly, luminaires that are listed for wet locations and have GFCI protection are permitted to be installed above a tub or shower enclosure.

(C) **Outdoor Outlets, Luminaires, Air-Cooling Equipment, and So On.** Outdoor luminaires and other equipment shall be listed for outdoor use.

#### 551.54 Grounding

(See also 551.56 on bonding of non-current-carrying metal parts.)

(A) **Power-Supply Grounding.** The grounding conductor in the supply cord or feeder shall be connected to the grounding bus or other approved grounding means in the distribution panelboard.

(B) **Distribution Panelboard.** The distribution panelboard shall have a grounding bus with terminals for all grounding conductors or other approved grounding means.

(C) **Insulated Grounded Conductor (Neutral Conductor).** The grounded circuit conductor (neutral conductor) shall be insulated from the equipment grounding conductors and from equipment enclosures and other grounded parts. The grounded circuit conductor (neutral conductor) terminals in the distribution panelboard and in ranges, clothes dryers, counter-mounted cooking units, and wall-mounted ovens shall be insulated from the equipment enclosure. Bonding screws, straps, or buses in the distribution panelboard or in appliances shall be removed and discarded. Connection of electric ranges and electric clothes dryers utilizing a grounded conductor, if cord-connected, shall be made with 4-conductor cord and 3-pole, 4-wire grounding-type plug caps and receptacles.

#### 551.55 Interior Equipment Grounding

(A) **Exposed Metal Parts.** In the electrical system, all exposed metal parts, enclosures, frames, luminaire canopies, and so forth, shall be effectively bonded to the grounding terminals or enclosure of the distribution panelboard.

**(B) Equipment Grounding and Bonding Conductors.** Bare wires, insulated wire with an outer finish that is green or green with one or more yellow stripes, shall be used for equipment grounding or bonding conductors only.

**(C) Grounding of Electrical Equipment.** Grounding of electrical equipment shall be accomplished by one or more of the following methods:

- (1) Connection of metal raceway, the sheath of Type MC and Type MI cable where the sheath is identified for grounding, or the armor of Type AC cable to metal enclosures.
- (2) A connection between the one or more equipment grounding conductors and a metal enclosure by means of a grounding screw, which shall be used for no other purpose, or a listed grounding device.
- (3) The equipment grounding conductor in nonmetallic-sheathed cable shall be permitted to be secured under a screw threaded into the luminaire canopy other than a mounting screw or cover screw, or attached to a listed grounding means (plate) in a nonmetallic outlet box for luminaire mounting. [Grounding means shall also be permitted for luminaire attachment screws.]

**(D) Grounding Connection in Nonmetallic Box.** A connection between the one or more equipment grounding conductors brought into a nonmetallic outlet box shall be so arranged that a connection of the equipment grounding conductor can be made to any fitting or device in that box that requires grounding.

**(E) Grounding Continuity.** Where more than one equipment grounding or bonding conductor of a branch circuit enters a box, all such conductors shall be in good electrical contact with each other, and the arrangement shall be such that the disconnection or removal of a receptacle, luminaire, or other device fed from the box will not interfere with or interrupt the grounding continuity.

**(F) Cord-Connected Appliances.** Cord-connected appliances, such as washing machines, clothes dryers, refrigerators, and the electrical system of gas ranges, and so forth, shall be grounded by means of an approved cord with equipment grounding conductor and grounding-type attachment plug.

### 551.56 Bonding of Non-Current-Carrying Metal Parts

**(A) Required Bonding.** All exposed non-current-carrying metal parts that are likely to become energized shall be effectively bonded to the grounding terminal or enclosure of the distribution panelboard.

**(B) Bonding Chassis.** A bonding conductor shall be connected between any distribution panelboard and an accessible terminal on the chassis. Aluminum or copper-clad aluminum conductors shall not be used for bonding if such conductors or their terminals are exposed to corrosive elements.

*Exception: Any recreational vehicle that employs a unitized metal chassis-frame construction to which the distribution panelboard is securely fastened with a bolt(s) and nut(s) or by welding or riveting shall be considered to be bonded.*

**(C) Bonding Conductor Requirements.** Grounding terminals shall be of the solderless type and listed as pressure terminal connectors recognized for the wire size used. The bonding conductor shall be solid or stranded, insulated or bare, and shall be 8 AWG copper minimum, or equal.

**(D) Metallic Roof and Exterior Bonding.** The metal roof and exterior covering shall be considered bonded where both of the following conditions apply:

- (1) The metal panels overlap one another and are securely attached to the wood or metal frame parts by metal fasteners.
- (2) The lower panel of the metal exterior covering is secured by metal fasteners at each cross member of the chassis, or the lower panel is connected to the chassis by a metal strap.

**(E) Gas, Water, and Waste Pipe Bonding.** The gas, water, and waste pipes shall be considered grounded if they are bonded to the chassis.

**(F) Furnace and Metal Air Duct Bonding.** Furnace and metal circulating air ducts shall be bonded.

### 551.57 Appliance Accessibility and Fastening

Every appliance shall be accessible for inspection, service, repair, and replacement without removal of permanent construction. Means shall be provided to securely fasten appliances in place when the recreational vehicle is in transit.

## V. Factory Tests

### 551.60 Factory Tests (Electrical)

Each recreational vehicle designed with a 120-volt or a 120/240-volt electrical system shall withstand the applied potential without electrical breakdown of a 1-minute, 900-volt ac or 1280-volt dc dielectric strength test, or a 1-second, 1080-volt ac or 1530-volt dc dielectric strength test, with all switches closed, between ungrounded and grounded conductors and the recreational vehicle ground. During the test, all switches and other controls shall be in the “on” position.

Fixtures, including luminaires and permanently installed appliances, shall not be required to withstand this test. The test shall be performed after branch circuits are complete prior to energizing the system and again after all outer coverings and cabinetry have been secured. The dielectric test shall be performed in accordance with the test equipment manufacturer's written instructions.

Each recreational vehicle shall be subjected to all of the following:

- (1) A continuity test to ensure that all metal parts are properly bonded
- (2) Operational tests to demonstrate that all equipment is properly connected and in working order
- (3) Polarity checks to determine that connections have been properly made
- (4) GFCI test to demonstrate that the ground fault protection device(s) installed on the recreational vehicle are operating properly.

## VI. Recreational Vehicle Parks

### 551.71 Type Receptacles Provided

Every recreational vehicle site with electrical supply shall be equipped with at least one 20-ampere, 125-volt receptacle. A minimum of 20 percent of all recreational vehicle sites, with electrical supply, shall each be equipped with a 50-ampere, 125/250-volt receptacle conforming to the configuration as identified in Figure 551.46(C). These electrical supplies shall be permitted to include additional receptacles that have configurations in accordance with 551.81. A minimum of 70 percent of all recreational vehicle sites with electrical supply shall each be equipped with a 30-ampere, 125-volt receptacle conforming to Figure 551.46(C). This supply shall be permitted to include additional receptacle configurations conforming to 551.81. The remainder of all recreational vehicle sites with electrical supply shall be equipped with one or more of the receptacle configurations conforming to 551.81. Dedicated tent sites with a 15- or 20-ampere electrical supply shall be permitted to be excluded when determining the percentage of recreational vehicle sites with 30- or 50-ampere receptacles.

Additional receptacles shall be permitted for the connection of electrical equipment outside the recreational vehicle within the recreational vehicle park.

At least one 20-ampere, 125-volt receptacle must be installed at each RV campsite. Existing recreational vehicle campgrounds may have some sites that are equipped with 30-ampere receptacles only. Adapter plugs or "cheater" cords are often used to connect an RV with a 20-ampere supply cord to a 30-ampere receptacle outlet. This practice does

not provide adequate overload protection for the cord or the connected load. The requirement ensures the availability of the properly rated receptacle.

Some newer recreational vehicles have a 50-ampere, 120/240-volt supply installed, and 20 percent of RV sites must be provided with 50-ampere, 125/250-volt receptacles to accommodate the larger electrical systems in some RVs. This requirement increases the load capacity for RV park services and feeders. Receptacle configurations are shown in Figure 551.46(C), and receptacle ratings are described in 551.81.

All 125-volt, single-phase, 15- and 20-ampere receptacles shall have listed ground-fault circuit-interrupter protection for personnel.

**Informational Note:** The percentage of 50 ampere sites required by 551.71 may be inadequate for seasonal recreational vehicle sites serving a higher percentage of recreational vehicles with 50 ampere electrical systems. In that type of recreational vehicle park, the percentage of 50 ampere sites could approach 100 percent.

### 551.72 Distribution System

Receptacles rated at 50 amperes shall be supplied from a branch circuit of the voltage class and rating of the receptacle. Other recreational vehicle sites with 125-volt, 20- and 30-ampere receptacles shall be permitted to be derived from any grounded distribution system that supplies 120-volt single-phase power. The neutral conductors shall not be reduced in size below the size of the ungrounded conductors for the site distribution. The neutral conductors shall be permitted to be reduced in size below the minimum required size of the ungrounded conductors for 240-volt, line-to-line, permanently connected loads only.

The distribution system of an RV park must supply the sites by a 120-volt, 2-wire circuit; a 120/240 volt, 3-wire circuit; or a 3-wire 120/208-volt circuit derived from a 208Y/120-volt, 3-phase, 4-wire system. See the commentary on 551.40(A) for information regarding the voltage rating of line-to-line connected appliances in RVs.

### 551.73 Calculated Load

**(A) Basis of Calculations.** Electrical services and feeders shall be calculated on the basis of not less than 9600 volt-amperes per site equipped with 50-ampere, 208Y/120 or 120/240-volt supply facilities; 3600 volt-amperes per site equipped with both 20-ampere and 30-ampere supply facilities; 2400 volt-amperes per site equipped with only 20-ampere supply facilities; and 600 volt-amperes per site

equipped with only 20-ampere supply facilities that are dedicated to tent sites. The demand factors set forth in Table 551.73(A) shall be the minimum allowable demand factors that shall be permitted in calculating load for service and feeders. Where the electrical supply for a recreational vehicle site has more than one receptacle, the calculated load shall be calculated only for the highest rated receptacle.

The calculated load for dedicated tent sites supplied with electricity can be smaller since these sites are not intended to accommodate recreational vehicles.

Where the electrical supply is in a location that serves two recreational vehicles, the equipment for both sites shall comply with 551.77, and the calculated load shall only be **calculated** for the two receptacles with the highest rating.

This second paragraph of 551.73(A) requires that, where receptacle outlets are installed at a location that can serve two RVs, the load is to be calculated for the two receptacles with the highest rating.

**(B) Transformers and Secondary Distribution Panelboards.** For the purpose of this *Code*, where the park service exceeds 240 volts, transformers and secondary distribution panelboards shall be treated as services.

**(C) Demand Factors.** The demand factor for a given number of sites shall apply to all sites indicated. For example, 20 sites calculated at 45 percent of 3600 volt-amperes results in a permissible demand of 1620 volt-amperes per site or a total of 32,400 volt-amperes for 20 sites.

Informational Note: These demand factors may be inadequate in areas of extreme hot or cold temperature with loaded circuits for heating or air conditioning.

**(D) Feeder-Circuit Capacity.** Recreational vehicle site feeder-circuit conductors shall have an ampacity not less than the loads supplied and shall be rated not less than 30 amperes. The neutral conductors shall have an ampacity not less than the ungrounded conductors.

Informational Note: Due to the long circuit lengths typical in most recreational vehicle parks, feeder conductor sizes found in the ampacity tables of Article 310 may be inadequate to maintain the voltage regulation suggested in the fine print note to 210.19. Total circuit voltage drop is a sum of the voltage drops of each serial circuit segment, where the load for each segment is calculated using the load that segment sees and the demand factors of 551.73(A).

Loads for other amenities such as, but not limited to, service buildings, recreational buildings, and swimming pools shall be calculated separately and then be added to the

**TABLE 551.73(A) Demand Factors for Site Feeders and Service-Entrance Conductors for Park Sites**

Number of Recreational Vehicle Sites	Demand Factor (%)
1	100
2	90
3	80
4	75
5	65
6	60
7–9	55
10–12	50
13–15	48
16–18	47
19–21	45
22–24	43
25–35	42
36 plus	41

value calculated for the recreational vehicle sites where they are all supplied by a common service.

**551.74 Overcurrent Protection**

Overcurrent protection shall be provided in accordance with Article 240.

**551.75 Grounding**

All electrical equipment and installations in recreational vehicle parks shall be grounded as required by Article 250.

**551.76 Grounding — Recreational Vehicle Site Supply Equipment**

**(A) Exposed Non-Current-Carrying Metal Parts.** Exposed non-current-carrying metal parts of fixed equipment, metal boxes, cabinets, and fittings that are not electrically connected to grounded equipment shall be grounded by an equipment grounding conductor run with the circuit conductors from the service equipment or from the transformer of a secondary distribution system. Equipment grounding conductors shall be sized in accordance with 250.122 and shall be permitted to be spliced by listed means.

The arrangement of equipment grounding connections shall be such that the disconnection or removal of a receptacle or other device will not interfere with, or interrupt, the grounding continuity.

**(B) Secondary Distribution System.** Each secondary distribution system shall be grounded at the transformer.

**(C) Grounded Conductor Not to Be Used as an Equipment Ground.** The grounded conductor shall not be used

as an equipment grounding conductor for recreational vehicles or equipment within the recreational vehicle park.

**(D) No Connection on the Load Side.** No connection to a grounding electrode shall be made to the grounded conductor on the load side of the service disconnecting means except as covered in 250.30(A) for separately derived systems, and 250.32(B) Exception for separate buildings.

### 551.77 Recreational Vehicle Site Supply Equipment

**(A) Location.** Where provided on back-in sites, the recreational vehicle site electrical supply equipment shall be located on the left (road) side of the parked vehicle, on a line that is 1.5 m to 2.1 m (5 ft to 7 ft) from the left edge (driver's side of the parked RV) of the stand and shall be located at any point on this line from the rear of the stand to 4.5 m (15 ft) forward of the rear of the stand.

For pull-through sites, the electrical supply equipment shall be permitted to be located at any point along the line that is 1.5 m to 2.1 m (5 ft to 7 ft) from the left edge (driver's side of the parked RV) from 4.9 m (16 ft) forward of the rear of the stand to the center point between the two roads that gives access to and egress from the pull-through sites.

The left edge (driver's side of the parked RV) of the stand shall be marked.

These requirements are intended to accommodate vehicles towing boats or other trailers. The location of the site supply equipment permitted for pull-through sites reduces the use of extension cords.

**(B) Disconnecting Means.** A disconnecting switch or circuit breaker shall be provided in the site supply equipment for disconnecting the power supply to the recreational vehicle.

**(C) Access.** All site supply equipment shall be accessible by an unobstructed entrance or passageway not less than 600 mm (2 ft) wide and 2.0 m (6 ft 6 in.) high.

**(D) Mounting Height.** Site supply equipment shall be located not less than 600 mm (2 ft) or more than 2.0 m (6 ft 6 in.) above the ground.

**(E) Working Space.** Sufficient space shall be provided and maintained about all electrical equipment to permit ready and safe operation, in accordance with 110.26.

**(F) Marking.** Where the site supply equipment contains a 125/250-volt receptacle, the equipment shall be marked as follows: "Turn disconnecting switch or circuit breaker off before inserting or removing plug. Plug must be fully in-

serted or removed." The marking shall be located on the equipment adjacent to the receptacle outlet.

The marking is to reduce the possibility of a partially engaged attachment plug, which could result in intermittent neutral (grounded conductor) contact. Loss of the neutral could momentarily apply the line-to-line voltage (240 volts) across 125-volt equipment, causing malfunction or damage.

### 551.78 Protection of Outdoor Equipment

**(A) Wet Locations.** All switches, circuit breakers, receptacles, control equipment, and metering devices located in wet locations shall be weatherproof.

**(B) Meters.** If secondary meters are installed, meter sockets without meters installed shall be blanked off with an approved blanking plate.

### 551.79 Clearance for Overhead Conductors

Open conductors of not over 600 volts, nominal, shall have a vertical clearance of not less than 5.5 m (18 ft) and a horizontal clearance of not less than 900 mm (3 ft) in all areas subject to recreational vehicle movement. In all other areas, clearances shall conform to 225.18 and 225.19.

Informational Note: For clearances of conductors over 600 volts, nominal, see 225.60 and 225.61.

### 551.80 Underground Service, Feeder, Branch-Circuit, and Recreational Vehicle Site Feeder-Circuit Conductors

**(A) General.** All direct-burial conductors, including the equipment grounding conductor if of aluminum, shall be insulated and identified for the use. All conductors shall be continuous from equipment to equipment. All splices and taps shall be made in approved junction boxes or by use of material listed and identified for the purpose.

**(B) Protection Against Physical Damage.** Direct-buried conductors and cables entering or leaving a trench shall be protected by rigid metal conduit, intermediate metal conduit, electrical metallic tubing with supplementary corrosion protection, rigid polyvinyl chloride conduit (PVC), nonmetallic underground conduit with conductors (NUCC), high density polyethylene conduit (HDPE), reinforced thermosetting resin conduit (RTRC), liquidtight flexible nonmetallic conduit, liquidtight flexible metal conduit, or other approved raceways or enclosures. Where subject to physical damage, the conductors or cables shall be protected by rigid metal conduit, intermediate metal conduit, Schedule 80 PVC conduit, or RTRC listed for exposure to physical damage. All such protection shall extend at least 450 mm (18 in.) into the trench from finished grade.

Informational Note: See 300.5 and Article 340 for conductors or Type UF cable used underground or in direct burial in earth.

### 551.81 Receptacles

A receptacle to supply electric power to a recreational vehicle shall be one of the configurations shown in Figure 551.46(C) in the following ratings:

- (1) 50-ampere — 125/250-volt, 50-ampere, 3-pole, 4-wire grounding type for 120/240-volt systems
- (2) 30-ampere — 125-volt, 30-ampere, 2-pole, 3-wire grounding type for 120-volt systems
- (3) 20-ampere — 125-volt, 20-ampere, 2-pole, 3-wire grounding type for 120-volt systems

Informational Note: Complete details of these configurations can be found in ANSI/NEMA WD 6-2002, National Electrical Manufacturers Association's *Standard for Dimensions of Attachment Plugs and Receptacles*, Figures 14-50, TT, and 5-20.

## I. General

### 552.1 Scope

The provisions of this article cover the electrical conductors and equipment installed within or on park trailers not covered fully under Articles 550 and 551.

The scope of Article 552 covers park trailers that have a single chassis and wheels, that do not exceed 400 ft<sup>2</sup> (set up), and that are not used as permanent residences. Additionally, Article 552 does not apply to units that meet the definition of *park trailer* (see 552.2) but are used for commercial purposes (see 552.4).

Park trailers equipped with electrical loads similar to

those used in mobile homes are not uncommon. It is also not uncommon for a park trailer to be located in the same park trailer community for several years without relocation.

Park trailers are somewhat similar to mobile homes and recreational vehicles, and many requirements in Article 552 are the same as or similar to those contained in Articles 550 and 551. Article 552, therefore, is similar in structure to Articles 550 and 551.

### 552.2 Definition

(See Articles 100, 550, and 551 for additional definitions.)

**Park Trailer.** A unit that is built on a single chassis mounted on wheels and has a gross trailer area not exceeding 37 m<sup>2</sup> (400 ft<sup>2</sup>) in the set-up mode.

### 552.4 General Requirements

A park trailer as specified in 552.2 is intended for seasonal use. It is not intended as a permanent dwelling unit or for commercial uses such as banks, clinics, offices, or similar.

## II. Low-Voltage Systems

In some park trailers, 12-volt systems are used for interior lighting and other small loads. The 12-volt system is often supplied from an on-board battery or through a transfer switch from a 120/12-volt transformer in conjunction with a full-wave rectifier.

### 552.10 Low-Voltage Systems

**(A) Low-Voltage Circuits.** Low-voltage circuits furnished and installed by the park trailer manufacturer, other than those related to braking, are subject to this *Code*. Circuits supplying lights subject to federal or state regulations shall comply with applicable government regulations and this *Code*.

The requirements of Article 552, Part II apply to the low-voltage wiring within the park trailer that would be used in place of 120-volt ac supplies. These requirements do not apply to the trailer braking circuits.

#### **(B) Low-Voltage Wiring.**

**(1) Material.** Copper conductors shall be used for low-voltage circuits.

*Exception:* A metal chassis or frame shall be permitted as the return path to the source of supply.

It is not the intent of 552.10(B)(1) to permit the sidewalls or the roof of a park trailer to serve as the ground return path. See the definition of *frame* in 551.2.

**(2) Conductor Types.** Conductors shall conform to the requirements for Type GXL, HDT, SGT, SGR, or Type SXL or shall have insulation in accordance with Table 310.104(A) or the equivalent. Conductor sizes 6 AWG through 18 AWG or SAE shall be listed. Single-wire, low-voltage conductors shall be of the stranded type.

Informational Note: See SAE Standard J1128-1995 for Types GXL, HDT, and SXL and SAE Standard J1127-1995 for Types SGT and SGR.

**(3) Marking.** All insulated low-voltage conductors shall be surface marked at intervals not greater than 1.2 m (4 ft) as follows:

- (1) Listed conductors shall be marked as required by the listing agency.
- (2) SAE conductors shall be marked with the name or logo of the manufacturer, specification designation, and wire gauge.
- (3) Other conductors shall be marked with the name or logo of the manufacturer, temperature rating, wire gauge, conductor material, and insulation thickness.

#### (C) Low-Voltage Wiring Methods.

**(1) Physical Protection.** Conductors shall be protected against physical damage and shall be secured. Where insulated conductors are clamped to the structure, the conductor insulation shall be supplemented by an additional wrap or layer of equivalent material, except that jacketed cables shall not be required to be so protected. Wiring shall be routed away from sharp edges, moving parts, or heat sources.

**(2) Splices.** Conductors shall be spliced or joined with splicing devices that provide a secure connection or by brazing, welding, or soldering with a fusible metal or alloy. Soldered splices shall first be spliced or joined to be mechanically and electrically secure without solder, and then soldered. All splices, joints, and free ends of conductors shall be covered with an insulation equivalent to that on the conductors.

**(3) Separation.** Battery and other low-voltage circuits shall be physically separated by at least a 13-mm (½-in.) gap or other approved means from circuits of a different power source. Acceptable methods shall be by clamping, routing, or equivalent means that ensure permanent total separation. Where circuits of different power sources cross, the external jacket of the nonmetallic-sheathed cables shall be deemed adequate separation.

**(4) Ground Connections.** Ground connections to the chassis or frame shall be made in an accessible location and shall be mechanically secure. Ground connections shall be by means of copper conductors and copper or copper-alloy terminals of the solderless type identified for the size of wire used. The surface on which ground terminals make contact shall be cleaned and be free from oxide or paint or shall be electrically connected through the use of a cadmium, tin, or zinc-plated internal/external-toothed lockwasher or locking terminals. Ground terminal attaching screws, rivets or bolts, nuts, and lockwashers shall be cadmium, tin, or zinc-plated except rivets shall be permitted to be unanodized aluminum where attaching to aluminum structures.

The chassis-grounding terminal of the battery shall be connected to the unit chassis with a minimum 8 AWG copper conductor. In the event the unbonded lead from the battery exceeds 8 AWG, the bonding conductor size shall be not less than that of the unbonded lead.

Section 552.10(C)(4) requires that the chassis-grounding terminal of the battery be bonded to the vehicle chassis in a mechanically secure manner and be placed in an accessible location using an 8 AWG or larger copper conductor. This arrangement minimizes the possibility of low-voltage circuit-fault currents passing through the ac panelboard bonding conductor and the equipment grounding conductor of the combination ac/dc appliance and subsequently passing through the negative dc conductor feeding the appliance that also may be bonded to the external metal cover of the appliance. The ac equipment grounding conductor of the appliance may not have sufficient ampacity to safely conduct the dc fault current, which would necessitate installation of the battery bonding conductor. Some recreational vehicles already have one side of the battery circuit bonded to the frame by an 8 AWG or larger copper conductor.

**(D) Battery Installations.** Storage batteries subject to the provisions of this *Code* shall be securely attached to the unit and installed in an area vaportight to the interior and ventilated directly to the exterior of the unit. Where batteries are installed in a compartment, the compartment shall be ventilated with openings having a minimum area of 1100 mm<sup>2</sup> (1.7 in.<sup>2</sup>) at both the top and at the bottom. Where compartment doors are equipped for ventilation, the openings shall be within 50 mm (2 in.) of the top and bottom. Batteries shall not be installed in a compartment containing spark- or flame-producing equipment.

#### (E) Overcurrent Protection.

**(1) Rating.** Low-voltage circuit wiring shall be protected by overcurrent protective devices rated not in excess of the ampacity of copper conductors, in accordance with Table 552.10(E)(1).

**TABLE 552.10(E)(1) Low-Voltage Overcurrent Protection**

Wire Size (AWG)	Ampacity	Wire Type
18	6	Stranded only
16	8	Stranded only
14	15	Stranded or solid
12	20	Stranded or solid
10	30	Stranded or solid

**(2) Type.** Circuit breakers or fuses shall be of an approved type, including automotive types. Fuseholders shall be clearly marked with maximum fuse size and shall be protected against shorting and physical damage by a cover or equivalent means.

Informational Note: For further information, see ANSI/SAE J554-1987, *Standard for Electric Fuses (Cartridge Type)*; SAE J1284-1988, *Standard for Blade Type Electric Fuses*; and UL 275-1993, *Standard for Automotive Glass Tube Fuses*.

Protection of fuseholders by a cover or equivalent means is intended to reduce the possibility of the low-voltage system shorting to ground.

**(3) Appliances.** Appliances such as pumps, compressors, heater blowers, and similar motor-driven appliances shall be installed in accordance with the manufacturer's instructions.

Motors that are controlled by automatic switching or by latching-type manual switches shall be protected in accordance with 430.32(B).

**(4) Location.** The overcurrent protective device shall be installed in an accessible location on the unit within 450 mm (18 in.) of the point where the power supply connects to the unit circuits. If located outside the park trailer, the device shall be protected against weather and physical damage.

*Exception: External low-voltage supply shall be permitted to have the overcurrent protective device within 450 mm (18 in.) after entering the unit or after leaving a metal raceway.*

**(F) Switches.** Switches shall have a dc rating not less than the connected load.

**(G) Luminaires.** All low-voltage interior luminaires rated more than 4 watts, employing lamps rated more than 1.2 watts, shall be listed.

Twelve-volt systems for running and signal lights, similar to those used in conventional automobiles, are covered in 552.10 and 552.20.

### III. Combination Electrical Systems

#### 552.20 Combination Electrical Systems

**(A) General.** Unit wiring suitable for connection to a battery or other low-voltage supply source shall be permitted to be connected to a 120-volt source, provided that the entire wiring system and equipment are rated and installed in full conformity with Parts I, III, IV, and V requirements of this article covering 120-volt electrical systems. Circuits fed from ac transformers shall not supply dc appliances.

**(B) Voltage Converters (120-Volt Alternating Current to Low-Voltage Direct Current).** The 120-volt ac side of the voltage converter shall be wired in full conformity with Parts I, III, IV, and V requirements of this article for 120-volt electrical systems.

*Exception: Converters supplied as an integral part of a listed appliance shall not be subject to 552.20(B).*

All converters and transformers shall be listed for use in recreation units and designed or equipped to provide over-temperature protection. To determine the converter rating, the following percentages shall be applied to the total connected load, including average battery-charging rate, of all 12-volt equipment:

The first 20 amperes of load at 100 percent plus  
The second 20 amperes of load at 50 percent plus  
All load above 40 amperes at 25 percent

*Exception: A low-voltage appliance that is controlled by a momentary switch (normally open) that has no means for holding in the closed position shall not be considered as a connected load when determining the required converter rating. Momentarily energized appliances shall be limited to those used to prepare the unit for occupancy or travel.*

**(C) Bonding Voltage Converter Enclosures.** The non-current-carrying metal enclosure of the voltage converter shall be connected to the frame of the unit with an 8 AWG copper conductor minimum. The grounding conductor for the battery and the metal enclosure shall be permitted to be the same conductor.

**(D) Dual-Voltage Fixtures Including Luminaires or Appliances.** Fixtures, including luminaires, or appliances having both 120-volt and low-voltage connections shall be listed for dual voltage.

In the dual-voltage fixtures, barriers are used to separate the 120-volt and the 12-volt wiring connections.

**(E) Autotransformers.** Autotransformers shall not be used.

**(F) Receptacles and Plug Caps.** Where a park trailer is equipped with a 120-volt or 120/240-volt ac system, a low-voltage system, or both, receptacles and plug caps of the low-voltage system shall differ in configuration from those of the 120-volt or 120/240-volt system. Where a unit equipped with a battery or dc system has an external connection for low-voltage power, the connector shall have a configuration that will not accept 120-volt power.

## IV. Nominal 120-Volt or 120/240-Volt Systems

### 552.40 120-Volt or 120/240-Volt, Nominal, Systems

**(A) General Requirements.** The electrical equipment and material of park trailers indicated for connection to a wiring system rated 120 volts, nominal, 2-wire with an equipment grounding conductor, or a wiring system rated 120/240 volts, nominal, 3-wire with an equipment grounding conductor, shall be listed and installed in accordance with the requirements of Parts I, III, IV, and V of this article.

**(B) Materials and Equipment.** Electrical materials, devices, appliances, fittings, and other equipment installed, intended for use in, or attached to the park trailer shall be listed. All products shall be used only in the manner in which they have been tested and found suitable for the intended use.

### 552.41 Receptacle Outlets Required

**(A) Spacing.** Receptacle outlets shall be installed at wall spaces 600 mm (2 ft) wide or more so that no point along the floor line is more than 1.8 m (6 ft), measured horizontally, from an outlet in that space.

*Exception No. 1: Bath and hallway areas.*

*Exception No. 2: Wall spaces occupied by kitchen cabinets, wardrobe cabinets, built-in furniture; behind doors that may open fully against a wall surface; or similar facilities.*

**(B) Location.** Receptacle outlets shall be installed as follows:

- (1) Adjacent to countertops in the kitchen [at least one on each side of the sink if countertops are on each side and are 300 mm (12 in.) or over in width]
- (2) Adjacent to the refrigerator and gas range space, except where a gas-fired refrigerator or cooking appliance, requiring no external electrical connection, is factory-installed

- (3) Adjacent to countertop spaces of 300 mm (12 in.) or more in width that cannot be reached from a receptacle required in 552.41(B)(1) by a cord of 1.8 m (6 ft) without crossing a traffic area, cooking appliance, or sink

**(C) Ground-Fault Circuit-Interrupter Protection.** Each 125-volt, single-phase, 15- or 20-ampere receptacle shall have ground-fault circuit-interrupter protection for personnel in the following locations:

- (1) Where the receptacles are installed to serve kitchen countertop surfaces
- (2) Within 1.8 m (6 ft) of any lavatory or sink

*Exception: Receptacles installed for appliances in dedicated spaces, such as for dishwashers, disposals, refrigerators, freezers, and laundry equipment.*

- (3) In the area occupied by a toilet, shower, tub, or any combination thereof
- (4) On the exterior of the unit

*Exception: Receptacles that are located inside of an access panel that is installed on the exterior of the unit to supply power for an installed appliance shall not be required to have ground-fault circuit-interrupter protection.*

The receptacle outlet shall be permitted in a listed luminaire. A receptacle outlet shall not be installed in a tub or combination tub–shower compartment.

It is common in a park trailer for a bathroom GFCI receptacle to be mounted in the side of a lavatory cabinet where installation of a receptacle outlet is not possible in a wall that does not provide the necessary depth. Receptacles of any type are not permitted in a tub or tub–shower compartment.

**(D) Pipe Heating Cable Outlet.** Where a pipe heating cable outlet is installed, the outlet shall be as follows:

- (1) Located within 600 mm (2 ft) of the cold water inlet
- (2) Connected to an interior branch circuit, other than a small-appliance branch circuit
- (3) On a circuit where all of the outlets are on the load side of the ground-fault circuit-interrupter protection for personnel
- (4) Mounted on the underside of the park trailer and shall not be considered to be the outdoor receptacle outlet required in 552.41(E)

**(E) Outdoor Receptacle Outlets.** At least one receptacle outlet shall be installed outdoors. A receptacle outlet located in a compartment accessible from the outside of the park trailer shall be considered an outdoor receptacle. Out-

door receptacle outlets shall be protected as required in 552.41(C)(4).

**(F) Receptacle Outlets Not Permitted.**

**(1) Shower or Bathtub Space.** Receptacle outlets shall not be installed in or within reach [750 mm (30 in.)] of a shower or bathtub space.

**(2) Face-Up Position.** A receptacle shall not be installed in a face-up position in any countertop.

### 552.43 Power Supply

**(A) Feeder.** The power supply to the park trailer shall be a feeder assembly consisting of not more than one listed 30-ampere or 50-ampere park trailer power-supply cord, with an integrally molded or securely attached cap, or a permanently installed feeder.

**(B) Power-Supply Cord.** If the park trailer has a power-supply cord, it shall be permanently attached to the distribution panelboard or to a junction box permanently connected to the distribution panelboard, with the free end terminating in a molded-on attachment plug cap.

Cords with adapters and pigtail ends, extension cords, and similar items shall not be attached to, or shipped with, a park trailer.

A suitable clamp or the equivalent shall be provided at the distribution panelboard knockout to afford strain relief for the cord to prevent strain from being transmitted to the terminals when the power-supply cord is handled in its intended manner.

The cord shall be a listed type with 3-wire, 120-volt or 4-wire, 120/240-volt conductors, one of which shall be identified by a continuous green color or a continuous green color with one or more yellow stripes for use as the grounding conductor.

**(C) Mast Weatherhead or Raceway.** Where the calculated load exceeds 50 amperes or where a permanent feeder is used, the supply shall be by means of one of the following:

- (1) One mast weatherhead installation, installed in accordance with Article 230, containing four continuous, insulated, color-coded feeder conductors, one of which shall be an equipment grounding conductor
- (2) A metal raceway, rigid nonmetallic conduit, or liquid-tight flexible nonmetallic conduit from the disconnecting means in the park trailer to the underside of the park trailer, with provisions for the attachment to a suitable junction box or fitting to the raceway on the underside of the park trailer [with or without conductors as in 550.10(I)(1)]

### 552.44 Cord

**(A) Permanently Connected.** Each power-supply assembly shall be factory supplied or factory installed and connected directly to the terminals of the distribution panelboard or conductors within a junction box and provided with means to prevent strain from being transmitted to the terminals. The ampacity of the conductors between each junction box and the terminals of each distribution panelboard shall be at least equal to the ampacity of the power-supply cord. The supply end of the assembly shall be equipped with an attachment plug of the type described in 552.44(C). Where the cord passes through the walls or floors, it shall be protected by means of conduit and bushings or equivalent. The cord assembly shall have permanent provisions for protection against corrosion and mechanical damage while the unit is in transit.

**(B) Cord Length.** The cord-exposed usable length shall be measured from the point of entrance to the park trailer or the face of the flanged surface inlet (motor-base attachment plug) to the face of the attachment plug at the supply end.

The cord-exposed usable length, measured to the point of entry on the unit exterior, shall be a minimum of 7.0 m (23 ft) where the point of entrance is at the side of the unit, or shall be a minimum 8.5 m (28 ft) where the point of entrance is at the rear of the unit. The maximum length shall not exceed 11 m (36½ ft).

Where the cord entrance into the unit is more than 900 mm (3 ft) above the ground, the minimum cord lengths above shall be increased by the vertical distance of the cord entrance heights above 900 mm (3 ft).

**(C) Attachment Plugs.**

**(1) Units with Two to Five 15- or 20-Ampere Branch Circuits.** Park trailers wired in accordance with 552.46(A) shall have an attachment plug that shall be 2-pole, 3-wire grounding-type, rated 30 amperes, 125 volts, conforming to the configuration shown in Figure 552.44(C) intended for use with units rated at 30 amperes, 125 volts.

*Informational Note:* Complete details of this configuration can be found in ANSI/NEMA WD 6-1989, National Electrical Manufacturers Association's *Standard for Dimensions of Attachment Plugs and Receptacles*, Figure TT.

**(2) Units with 50-Ampere Power Supply Assembly.** Park trailers having a power-supply assembly rated 50 amperes as permitted by 552.43(B) shall have a 3-pole, 4-wire grounding-type attachment plug rated 50 amperes, 125/250 volts, conforming to the configuration shown in Figure 552.44(C).

*Informational Note:* Complete details of this configuration can be found in ANSI/NEMA WD 6-1989, National Electrical Manufacturers Association *Standard for Dimensions of Attachment Plugs and Receptacles*, Figure 14-50.

**FIGURE 552.44(C) Attachment Cap and Receptacle Configurations.**

The 50-ampere receptacle and plug configurations used for park trailers appear in NEMA WD 6-2002, *Wiring Devices — Dimensional Requirements*; however, the 30-ampere plug and receptacle configurations are unique to recreational vehicles and are described in UL 498, *Standard for Attachment Plugs and Receptacles*.

**(D) Labeling at Electrical Entrance.** Each park trailer shall have permanently affixed to the exterior skin, at or near the point of entrance of the power-supply assembly, a label 75 mm × 45 mm (3 in. × 1¾ in.) minimum size, made of etched, metal-stamped, or embossed brass, stainless steel, or anodized or alclad aluminum not less than 0.51 mm (0.020 in.) thick, or other suitable material [e.g., 0.13 mm (0.005 in.) thick plastic laminate], that reads, as appropriate, either

THIS CONNECTION IS FOR 110–125-VOLT AC,  
60 HZ, 30 AMPERE SUPPLY

or

THIS CONNECTION IS FOR 208Y/120-VOLT  
OR 120/240-VOLT AC, 3-POLE, 4-WIRE,  
60 HZ, \_\_\_\_\_ AMPERE SUPPLY.

The correct ampere rating shall be marked in the blank space.

**(E) Location.** The point of entrance of a power-supply assembly shall be located within 4.5 m (15 ft) of the rear, on the left (road) side or at the rear, left of the longitudinal center of the unit, within 450 mm (18 in.) of the outside wall.

*Exception:* A park trailer shall be permitted to have the electrical point of entrance located more than 4.5 m (15 ft) from the rear. Where this occurs, the distance beyond the 4.5-m (15-ft) dimension shall be added to the cord's minimum length as specified in 551.46(B).

## 552.45 Distribution Panelboard

**(A) Listed and Appropriately Rated.** A listed and appropriately rated distribution panelboard shall be used. The grounded conductor termination bar shall be insulated from the enclosure as provided in 552.55(C). An equipment grounding terminal bar shall be attached inside the metal enclosure of the panelboard.

**(B) Location.** The distribution panelboard shall be installed in a readily accessible location. Working clearance for the panelboard shall be not less than 600 mm (24 in.) wide and 750 mm (30 in.) deep.

*Exception:* Where the panelboard cover is exposed to the inside aisle space, one of the working clearance dimensions shall be permitted to be reduced to a minimum of 550 mm (22 in.). A panelboard shall be considered exposed where the panelboard cover is within 50 mm (2 in.) of the aisle's finished surface.

**(C) Dead-Front Type.** The distribution panelboard shall be of the dead-front type. A main disconnecting means shall be provided where fuses are used or where more than two circuit breakers are employed. A main overcurrent protective device not exceeding the power-supply assembly rating shall be provided where more than two branch circuits are employed.

## 552.46 Branch Circuits

Branch circuits shall be determined in accordance with 552.46(A) and (B).

**(A) Two to Five 15- or 20-Ampere Circuits.** Two to five 15- or 20-ampere circuits to supply lights, receptacle outlets, and fixed appliances shall be permitted. Such park trailers shall be equipped with a distribution panelboard rated at 120 volts maximum with a 30-ampere rated main power supply assembly. Not more than two 120-volt thermostatically controlled appliances (i.e., air conditioner and water heater) shall be installed in such systems unless appliance isolation switching, energy management systems, or similar methods are used.

*Exception:* Additional 15- or 20-ampere circuits shall be permitted where a listed energy management system rated at 30 amperes maximum is employed within the system.

**(B) More Than Five Circuits.** Where more than five circuits are needed, they shall be determined in accordance with 552.46(B)(1), (B)(2), and (B)(3).

**(1) Lighting.** Based on 33 volt-amperes/m<sup>2</sup> (3 VA/ft<sup>2</sup>) multiplied by the outside dimensions of the park trailer (coupler

excluded) divided by 120 volts to determine the number of 15- or 20-ampere lighting area circuits, for example,

$$\frac{3 \times \text{length} \times \text{width}}{120 \times 15 \text{ (or } 20\text{)}} = \text{No. of 15- (or 20-) ampere circuits}$$

The lighting circuits shall be permitted to serve listed cord-connected kitchen waste disposers and to provide power for supplemental equipment and lighting on gas-fired ranges, ovens, or counter-mounted cooking units.

**(2) Small Appliances.** Small-appliance branch circuits shall be installed in accordance with 210.11(C)(1).

**(3) General Appliances.** (including furnace, water heater, space heater, range, and central or room air conditioner, etc.) An individual branch circuit shall be permitted to supply any load for which it is rated. There shall be one or more circuits of adequate rating in accordance with (a) through (d).

Informational Note No. 1: For the laundry branch circuit, see 210.11(C)(2).

Informational Note No. 2: For central air conditioning, see Article 440.

(a) The total rating of fixed appliances shall not exceed 50 percent of the circuit rating if lighting outlets, general-use receptacles, or both are also supplied.

(b) For fixed appliances with a motor(s) larger than  $\frac{1}{8}$  horsepower, the total calculated load shall be based on 125 percent of the largest motor plus the sum of the other loads. Where a branch circuit supplies continuous load(s) or any combination of continuous and noncontinuous loads, the branch-circuit conductor size shall be in accordance with 210.19(A).

(c) The rating of a single cord-and-plug-connected appliance supplied by other than an individual branch circuit shall not exceed 80 percent of the circuit rating.

(d) The rating of a range branch circuit shall be based on the range demand as specified for ranges in 552.47(B)(5).

### 552.47 Calculations

The following method shall be employed in computing the supply-cord and distribution-panelboard load for each feeder assembly for each park trailer in lieu of the procedure shown in Article 220 and shall be based on a 3-wire, 208Y/120-volt or 120/240-volt supply with 120-volt loads balanced between the two phases of the 3-wire system.

**(A) Lighting and Small-Appliance Load.** Lighting Volt-Amperes: Length times width of park trailer floor (outside dimensions) times 33 volt-amperes/m<sup>2</sup> (3 VA/ft<sup>2</sup>). For example,

$$\text{Length} \times \text{width} \times 3 = \text{lighting volt-amperes}$$

Small-Appliance Volt-Amperes: Number of circuits times 1500 volt-amperes for each 20-ampere appliance receptacle circuit (see definition of *Appliance, Portable* with fine print note) including 1500 volt-amperes for laundry circuit. For example,

$$\text{No. of circuits} \times 1500 = \text{small-appliance volt-amperes}$$

Total: Lighting volt-amperes plus small-appliance volt-amperes = total volt-amperes

First 3000 total volt-amperes at 100 percent plus remainder at 35 percent = volt-amperes to be divided by 240 volts to obtain current (amperes) per leg.

**(B) Total Load for Determining Power Supply.** Total load for determining power supply is the sum of the following:

- (1) Lighting and small-appliance load as calculated in 552.47(A).
- (2) Nameplate amperes for motors and heater loads (exhaust fans, air conditioners, electric, gas, or oil heating). Omit smaller of the heating and cooling loads, except include blower motor if used as air-conditioner evaporator motor. Where an air conditioner is not installed and a 50-ampere power-supply cord is provided, allow 15 amperes per phase for air conditioning.
- (3) Twenty-five percent of current of largest motor in (B)(2).
- (4) Total of nameplate amperes for disposal, dishwasher, water heater, clothes dryer, wall-mounted oven, cooking units. Where the number of these appliances exceeds three, use 75 percent of total.
- (5) Derive amperes for freestanding range (as distinguished from separate ovens and cooking units) by dividing the following values by 240 volts:

Nameplate Rating (watts)	Use (volt-amperes)
0–10,000	80 percent of rating
Over 10,000–12,500	8,000
Over 12,500–13,500	8,400
Over 13,500–14,500	8,800
Over 14,500–15,500	9,200
Over 15,500–16,500	9,600
Over 16,500–17,500	10,000

- (6) If outlets or circuits are provided for other than factory-installed appliances, include the anticipated load.

Informational Note: Refer to Informative Annex D, Example D12, for an illustration of the application of this calculation.

**(C) Optional Method of Calculation for Lighting and Appliance Load.** For park trailers, the optional method for

calculating lighting and appliance load shown in 220.82 shall be permitted.

### 552.48 Wiring Methods

**(A) Wiring Systems.** Cables and raceways installed in accordance with Articles 320, 322, 330 through 340, 342 through 362, 386, and 388 shall be permitted in accordance with their applicable article, except as otherwise specified in this article. An equipment grounding means shall be provided in accordance with 250.118.

See the commentary following 348.60 for information regarding the use of flexible metal conduit as an equipment grounding conductor.

**(B) Conduit and Tubing.** Where rigid metal conduit or intermediate metal conduit is terminated at an enclosure with a locknut and bushing connection, two locknuts shall be provided, one inside and one outside of the enclosure. All cut ends of conduit and tubing shall be reamed or otherwise finished to remove rough edges.

For more information on the protection of conductor insulation against abrasion at conduit and tubing terminations, see the commentary following 344.28, 358.28(A), and 300.4(G).

**(C) Nonmetallic Boxes.** Nonmetallic boxes shall be acceptable only with nonmetallic-sheathed cable or nonmetallic raceways.

**(D) Boxes.** In walls and ceilings constructed of wood or other combustible material, boxes and fittings shall be flush with the finished surface or project therefrom.

**(E) Mounting.** Wall and ceiling boxes shall be mounted in accordance with Article 314.

*Exception No. 1: Snap-in-type boxes or boxes provided with special wall or ceiling brackets that securely fasten boxes in walls or ceilings shall be permitted.*

*Exception No. 2: A wooden plate providing a 38-mm (1½-in.) minimum width backing around the box and of a thickness of 13 mm (½ in.) or greater (actual) attached directly to the wall panel shall be considered as approved means for mounting outlet boxes.*

Exception No. 2 permits the mounting of outlet boxes by screws to a wooden plate that is secured directly to the back of a wall panel. The wooden plate must be not less than ½ in. thick and must extend at least 1½ in. around the box. This

requirement recognizes the special construction of recreational vehicle walls, which often makes it difficult or impossible to attach an outlet box to a structural member, as required by 314.23(B).

**(F) Cable Sheath.** The sheath of nonmetallic-sheathed cable, and the armor of metal-clad cable and Type AC cable, shall be continuous between outlet boxes and other enclosures.

**(G) Protected.** Metal-clad, Type AC, or nonmetallic-sheathed cables and electrical nonmetallic tubing shall be permitted to pass through the centers of the wide side of 2 by 4 wood studs. However, they shall be protected where they pass through 2 by 2 wood studs or at other wood studs or frames where the cable or tubing would be less than 32 mm (1¼ in.) from the inside or outside surface. Steel plates on each side of the cable or tubing, or a steel tube, with not less than 1.35 mm (0.053 in.) wall thickness, shall be installed to protect the cable or tubing. These plates or tubes shall be securely held in place. Where nonmetallic-sheathed cables pass through punched, cut, or drilled slots or holes in metal members, the cable shall be protected by bushings or grommets securely fastened in the opening prior to installation of the cable.

**(H) Cable Supports.** Where connected with cable connectors or clamps, cables shall be supported within 300 mm (12 in.) of outlet boxes, distribution panelboards, and splice boxes on appliances. Supports shall be provided at intervals not exceeding 1.4 m (4½ ft) at other places.

**(I) Nonmetallic Box Without Cable Clamps.** Nonmetallic-sheathed cables shall be supported within 200 mm (8 in.) of a nonmetallic outlet box without cable clamps.

*Exception: Where wiring devices with integral enclosures are employed with a loop of extra cable to permit future replacement of the device, the cable loop shall be considered as an integral portion of the device.*

**(J) Physical Damage.** Where subject to physical damage, exposed nonmetallic cable shall be protected by covering boards, guard strips, raceways, or other means.

**(K) Receptacle Faceplates.** Metal faceplates shall comply with 406.5(A). Nonmetallic faceplates shall comply with 406.5(C).

**(L) Metal Faceplates Grounded.** Where metal faceplates are used, they shall be grounded.

**(M) Moisture or Physical Damage.** Where outdoor or under-chassis wiring is 120 volts, nominal, or over and is

exposed to moisture or physical damage, the wiring shall be protected by rigid metal conduit, by intermediate metal conduit, by electrical metallic tubing, by rigid nonmetallic conduit, or by Type MI cable that is closely routed against frames and equipment enclosures or other raceway or cable identified for the application.

**(N) Component Interconnections.** Fittings and connectors that are intended to be concealed at the time of assembly shall be listed and identified for the interconnection of building components. Such fittings and connectors shall be equal to the wiring method employed in insulation, temperature rise, and fault-current withstanding, and shall be capable of enduring the vibration and shock occurring in park trailers.

**(O) Method of Connecting Expandable Units.** The method of connecting expandable units to the main body of the vehicle shall comply with the following as applicable:

- (1) That portion of a branch circuit that is installed in an expandable unit shall be permitted to be connected to the branch circuit in the main body of the vehicle by means of a flexible cord or attachment plug and cord listed for hard usage. The cord and its connections shall conform to all provisions of Article 400 and shall be considered as a permitted use under 400.7.
- (2) If the receptacle provided for connection of the cord to the main circuit is located on the outside of the unit, it shall be protected with a ground-fault circuit interrupter for personnel and be listed for wet locations. A cord located on the outside of a unit shall be identified for outdoor use.
- (3) Unless removable or stored within the unit interior, the cord assembly shall have permanent provisions for protection against corrosion and mechanical damage while the unit is in transit.
- (4) If an attachment plug and cord is used, it shall be installed so as not to permit exposed live attachment plug pins.

**(P) Prewiring for Air-Conditioning Installation.** Prewiring installed for the purpose of facilitating future air-conditioning installation shall comply with the applicable portions of this article and the following:

- (1) An overcurrent protective device with a rating compatible with the circuit conductors shall be installed in the distribution panelboard and wiring connections completed.
- (2) The load end of the circuit shall terminate in a junction box with a blank cover or other listed enclosure. Where a junction box with a blank cover is used, the free ends of the conductors shall be adequately capped or taped.
- (3) A label conforming to 552.44(D) shall be placed on or adjacent to the junction box and shall read as follows:

AIR-CONDITIONING CIRCUIT.  
THIS CONNECTION IS FOR AIR CONDITIONERS  
RATED 110–125-VOLT AC, 60 HZ,  
\_\_\_\_ AMPERES MAXIMUM.  
DO NOT EXCEED CIRCUIT RATING.

An ampere rating, not to exceed 80 percent of the circuit rating, shall be legibly marked in the blank space.

- (4) The circuit shall serve no other purpose.

#### **552.49 Maximum Number of Conductors in Boxes**

The maximum number of conductors permitted in boxes shall be in accordance with 314.16.

#### **552.50 Grounded Conductors**

The identification of grounded conductors shall be in accordance with 200.6.

#### **552.51 Connection of Terminals and Splices**

Conductor splices and connections at terminals shall be in accordance with 110.14.

#### **552.52 Switches**

Switches shall be rated as required by 552.52(A) and (B).

**(A) Lighting Circuits.** For lighting circuits, switches shall be rated not less than 10 amperes, 120/125 volts, and in no case less than the connected load.

**(B) Motors or Other Loads.** For motors or other loads, switches shall have ampere or horsepower ratings, or both, adequate for loads controlled. (An ac general-use snap switch shall be permitted to control a motor 2 hp or less with full-load current not over 80 percent of the switch ampere rating.)

#### **552.53 Receptacles**

All receptacle outlets shall be of the grounding type and installed in accordance with 210.21 and 406.4.

#### **552.54 Luminaires**

**(A) General.** Any combustible wall or ceiling finish exposed between the edge of a luminaire canopy or pan and the outlet box shall be covered with noncombustible material or a material identified for the purpose.

**(B) Shower Luminaires.** If a luminaire is provided over a bathtub or in a shower stall, it shall be of the enclosed and gasketed type and listed for the type of installation, and it shall be ground-fault circuit-interrupter protected.

The switch for shower luminaires and exhaust fans, located over a tub or in a shower stall, shall be located outside the tub or shower space.

Due to the low ceilings in park trailers, luminaires installed above a tub or shower enclosure may be easily reached by most persons standing in the enclosure, and accordingly, luminaires that are listed for wet locations and have GFCI protection are permitted to be installed above a tub or shower enclosure.

**(C) Outdoor Outlets, Luminaires, Air-Cooling Equipment, and So On.** Outdoor luminaires and other equipment shall be listed for outdoor use or wet locations.

### 552.55 Grounding

(See also 552.57 on bonding of non-current-carrying metal parts.)

**(A) Power-Supply Grounding.** The grounding conductor in the supply cord or feeder shall be connected to the grounding bus or other approved grounding means in the distribution panelboard.

**(B) Distribution Panelboard.** The distribution panelboard shall have a grounding bus with sufficient terminals for all grounding conductors or other approved grounding means.

**(C) Insulated Grounded Conductor.** The grounded circuit conductor shall be insulated from the equipment grounding conductors and from equipment enclosures and other grounded parts. The grounded circuit conductor terminals in the distribution panelboard and in ranges, clothes dryers, counter-mounted cooking units, and wall-mounted ovens shall be insulated from the equipment enclosure. Bonding screws, straps, or buses in the distribution panelboard or in appliances shall be removed and discarded. Connection of electric ranges and electric clothes dryers utilizing a grounded conductor, if cord-connected, shall be made with 4-conductor cord and 3-pole, 4-wire, grounding-type plug caps and receptacles.

### 552.56 Interior Equipment Grounding

**(A) Exposed Metal Parts.** In the electrical system, all exposed metal parts, enclosures, frames, luminaire canopies, and so forth, shall be effectively bonded to the grounding terminals or enclosure of the distribution panelboard.

**(B) Equipment Grounding Conductors.** Bare conductors or conductors with insulation or individual covering that is green or green with one or more yellow stripes shall be used for equipment grounding conductors only.

**(C) Grounding of Electrical Equipment.** Where grounding of electrical equipment is specified, it shall be permitted as follows:

- (1) Connection of metal raceway (conduit or electrical metallic tubing), the sheath of Type MC and Type MI cable where the sheath is identified for grounding, or the armor of Type AC cable to metal enclosures.
- (2) A connection between the one or more equipment grounding conductors and a metal box by means of a grounding screw, which shall be used for no other purpose, or a listed grounding device.
- (3) The equipment grounding conductor in nonmetallic-sheathed cable shall be permitted to be secured under a screw threaded into the luminaire canopy other than a mounting screw or cover screw or attached to a listed grounding means (plate) in a nonmetallic outlet box for luminaire mounting (grounding means shall also be permitted for luminaire attachment screws).

**(D) Grounding Connection in Nonmetallic Box.** A connection between the one or more grounding conductors brought into a nonmetallic outlet box shall be arranged so that a connection can be made to any fitting or device in that box that requires grounding.

**(E) Grounding Continuity.** Where more than one equipment grounding conductor of a branch circuit enters a box, all such conductors shall be in good electrical contact with each other, and the arrangement shall be such that the disconnection or removal of a receptacle, fixture, including a luminaire, or other device fed from the box will not interfere with or interrupt the grounding continuity.

**(F) Cord-Connected Appliances.** Cord-connected appliances, such as washing machines, clothes dryers, refrigerators, and the electrical system of gas ranges, and so on, shall be grounded by means of an approved cord with equipment grounding conductor and grounding-type attachment plug.

### 552.57 Bonding of Non-Current-Carrying Metal Parts

**(A) Required Bonding.** All exposed non-current-carrying metal parts that are likely to become energized shall be effectively bonded to the grounding terminal or enclosure of the distribution panelboard.

**(B) Bonding Chassis.** A bonding conductor shall be connected between any distribution panelboard and an accessible terminal on the chassis. Aluminum or copper-clad aluminum conductors shall not be used for bonding if such conductors or their terminals are exposed to corrosive elements.

*Exception: Any park trailer that employs a unitized metal chassis-frame construction to which the distribution panel-*

*board is securely fastened with a bolt(s) and nut(s) or by welding or riveting shall be considered to be bonded.*

**(C) Bonding Conductor Requirements.** Grounding terminals shall be of the solderless type and listed as pressure terminal connectors recognized for the wire size used. The bonding conductor shall be solid or stranded, insulated or bare, and shall be 8 AWG copper minimum or equivalent.

**(D) Metallic Roof and Exterior Bonding.** The metal roof and exterior covering shall be considered bonded where both of the following conditions apply:

- (1) The metal panels overlap one another and are securely attached to the wood or metal frame parts by metal fasteners.
- (2) The lower panel of the metal exterior covering is secured by metal fasteners at each cross member of the chassis, or the lower panel is connected to the chassis by a metal strap.

**(E) Gas, Water, and Waste Pipe Bonding.** The gas, water, and waste pipes shall be considered grounded if they are bonded to the chassis.

**(F) Furnace and Metal Air Duct Bonding.** Furnace and metal circulating air ducts shall be bonded.

### 552.58 Appliance Accessibility and Fastening

Every appliance shall be accessible for inspection, service, repair, and replacement without removal of permanent construction. Means shall be provided to securely fasten appliances in place when the park trailer is in transit.

### 552.59 Outdoor Outlets, Fixtures, Including Luminaires, Air-Cooling Equipment, and So On

**(A) Listed for Outdoor Use.** Outdoor fixtures, including luminaires, and equipment shall be listed for outdoor use. Outdoor receptacle outlets shall be in accordance with 406.9(A) and (B). Switches and circuit breakers installed outdoors shall comply with 404.4.

**(B) Outside Heating Equipment, Air-Conditioning Equipment, or Both.** A park trailer provided with a branch circuit designed to energize outside heating equipment or air-conditioning equipment, or both, located outside the park trailer, other than room air conditioners, shall have such branch-circuit conductors terminate in a listed outlet box or

disconnecting means located on the outside of the park trailer. A label shall be permanently affixed within 150 mm (6 in.) from the listed box or disconnecting means and shall contain the following information:

THIS CONNECTION IS FOR HEATING  
AND/OR AIR-CONDITIONING EQUIPMENT.  
THE BRANCH CIRCUIT IS RATED AT NOT MORE  
THAN \_\_\_\_\_ AMPERES, AT \_\_\_\_\_ VOLTS,  
60 HZ, \_\_\_\_\_ CONDUCTOR AMPACITY.  
A DISCONNECTING MEANS SHALL BE  
LOCATED WITHIN SIGHT OF THE EQUIPMENT.

The correct voltage and ampere rating shall be given. The tag shall not be less than 0.51 mm (0.020 in.) thick etched brass, stainless steel, anodized or alclad aluminum, or equivalent. The tag shall not be less than 75 mm × 45 mm (3 in. × 1¾ in.) minimum size.

## V. Factory Tests

### 552.60 Factory Tests (Electrical)

Each park trailer shall be subjected to the tests required by 552.60(A) and (B).

**(A) Circuits of 120 Volts or 120/240 Volts.** Each park trailer designed with a 120-volt or a 120/240-volt electrical system shall withstand the applied potential without electrical breakdown of a 1-minute, 900-volt dielectric strength test, or a 1-second, 1080-volt dielectric strength test, with all switches closed, between ungrounded and grounded conductors and the park trailer ground. During the test, all switches and other controls shall be in the on position. Fixtures, including luminaires, and permanently installed appliances shall not be required to withstand this test.

Each park trailer shall be subjected to the following:

- (1) A continuity test to ensure that all metal parts are properly bonded
- (2) Operational tests to demonstrate that all equipment is properly connected and in working order
- (3) Polarity checks to determine that connections have been properly made
- (4) Receptacles requiring GFCI protection shall be tested for correct function by the use of a GFCI testing device

**(B) Low-Voltage Circuits.** An operational test of low-voltage circuits shall be conducted to demonstrate that all equipment is connected and in electrical working order. This test shall be performed in the final stages of production after all outer coverings and cabinetry have been secured.

#### I. General

##### 553.1 Scope

This article covers wiring, services, feeders, and grounding for floating buildings.

Although the *Code* does not cover electrical installations in ships or watercraft, it does cover installations for floating buildings. Floating buildings may be restaurants, aquariums, dwelling units or many other occupancies. All other applicable articles of the *Code* apply to these floating buildings.

##### 553.2 Definition

**Floating Building.** A building unit, as defined in Article 100, that floats on water, is moored in a permanent location, and has a premises wiring system served through connection by permanent wiring to an electrical supply system not located on the premises.

#### II. Services and Feeders

##### 553.4 Location of Service Equipment

The service equipment for a floating building shall be located adjacent to, but not in or on, the building or any floating structure. The main overcurrent protective device that feeds the floating structure shall have ground fault protection not exceeding 100 mA. Ground fault protection of each individual branch or feeder circuit shall be permitted as a suitable alternative.

The intent is to ensure that supply conductors to a floating building can be disconnected in an emergency, such as during a storm, when the floating building has to be moved quickly. Service equipment is not permitted to be installed on the floating building and any other floating structure such as a wharf or pier.

Overcurrent protection for supply conductors is provided by the service equipment, and since these conductors may develop leakage, ground fault protection is required at this main device, or alternatively, for each feeder or branch circuit. Factors such as corrosion or lack of maintenance may cause ground faults to the metal surfaces of floating buildings or shore powered vessels. Persons in contact with these metal surfaces, in proximity to the water surrounding the metal surface, or attempting to exit the water via a metal swim platform or ladder may be subjected to an electrical shock. While it is permitted to use branch circuit GFCI devices, which may trip as low as 4 mA, this may not be practical for all floating buildings. Therefore the ground-fault protection device is permitted to operate at a current level of 100 mA or less. Devices operating at current levels higher than those specified for a Class A GFCI in UL 943, *Standard for Ground-Fault Circuit Interrupters*, do not provide ground-fault circuit-interrupter protection of personnel. See Article 100 for the definition of *ground-fault circuit interrupter*.

##### 553.5 Service Conductors

One set of service conductors shall be permitted to serve more than one set of service equipment.

##### 553.6 Feeder Conductors

Each floating building shall be supplied by a single set of feeder conductors from its service equipment.

*Exception: Where the floating building has multiple occupancy, each occupant shall be permitted to be supplied by a single set of feeder conductors extended from the occupant's service equipment to the occupant's panelboard.*

##### 553.7 Installation of Services and Feeders

**(A) Flexibility.** Flexibility of the wiring system shall be maintained between floating buildings and the supply con-

ductors. All wiring shall be installed so that motion of the water surface and changes in the water level will not result in unsafe conditions.

**(B) Wiring Methods.** Liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit with approved fittings shall be permitted for feeders and where flexible connections are required for services. Extra-hard usage portable power cable listed for both wet locations and sunlight resistance shall be permitted for a feeder to a floating building where flexibility is required. Other raceways suitable for the location shall be permitted to be installed where flexibility is not required.

Informational Note: See 555.1 and 555.13.

Liquidtight flexible nonmetallic conduit with approved fittings is permitted where flexible connections are required. Where Type W cables from Table 400.4 are used, they must be listed for use in wet locations. Not all Type W cables are listed for wet location applications.

### III. Grounding

#### 553.8 General Requirements

Grounding at floating buildings shall comply with 553.8(A) through (D).

**(A) Grounding of Electrical and Nonelectrical Parts.** Grounding of both electrical and nonelectrical parts in a floating building shall be through connection to a grounding bus in the building panelboard.

**(B) Installation and Connection of Equipment Grounding Conductor.** The equipment grounding conductor shall be installed with the feeder conductors and connected to a grounding terminal in the service equipment.

**(C) Identification of Equipment Grounding Conductor.** The equipment grounding conductor shall be an insulated copper conductor with a continuous outer finish that is either green or green with one or more yellow stripes. For conductors larger than 6 AWG, or where multiconductor cables are used, re-identification of conductors as allowed in 250.119(A)(2)(2) and (A)(2)(3) or 250.119(B)(2) and (B)(3) shall be permitted.

**(D) Grounding Electrode Conductor Connection.** The grounding terminal in the service equipment shall be grounded by connection through an insulated grounding electrode conductor to a grounding electrode on shore.

Section 553.8 provides four requirements for grounding a floating building. Grounding of electrical and nonelectrical parts must be connected to a grounding bus at the building panelboard. An equipment grounding conductor must be included in the feeder supplying the building and connected to the grounding terminal at the service equipment. For conductor sizes 6 AWG and smaller, the equipment grounding conductor must be provided with green insulation or green insulation with a yellow tracer. Finally, an insulated grounding electrode conductor must be installed between the service equipment and the grounding electrode on shore.

#### 553.9 Insulated Neutral

The grounded circuit conductor (neutral) shall be an insulated conductor identified in compliance with 200.6. The neutral conductor shall be connected to the equipment grounding terminal in the service equipment, and, except for that connection, it shall be insulated from the equipment grounding conductors, equipment enclosures, and all other grounded parts. The neutral conductor terminals in the panelboard and in ranges, clothes dryers, counter-mounted cooking units, and the like shall be insulated from the enclosures.

#### 553.10 Equipment Grounding

**(A) Electrical Systems.** All enclosures and exposed metal parts of electrical systems shall be connected to the grounding bus.

**(B) Cord-Connected Appliances.** Where required to be grounded, cord-connected appliances shall be grounded by means of an equipment grounding conductor in the cord and a grounding-type attachment plug.

#### 553.11 Bonding of Non-Current-Carrying Metal Parts

All metal parts in contact with the water, all metal piping, and all non-current-carrying metal parts that are likely to become energized shall be connected to the grounding bus in the panelboard.

### 555.1 Scope

This article covers the installation of wiring and equipment in the areas comprising fixed or floating piers, wharves, docks, and other areas in marinas, boatyards, boat basins, boathouses, yacht clubs, boat condominiums, docking facilities associated with residential condominiums, any multiple docking facility, or similar occupancies, and facilities that are used, or intended for use, for the purpose of repair, berthing, launching, storage, or fueling of small craft and the moorage of floating buildings.

Private, noncommercial docking facilities constructed or occupied for the use of the owner or residents of the associated single-family dwelling are not covered by this article.

Informational Note: See NFPA 303-2006, *Fire Protection Standard for Marinas and Boatyards*, for additional information.

The requirements of Article 555 apply to public and private docking, storage, repair, and fueling facilities for small craft. The term *small craft* is not defined in the *Code*. However, based on the scope of NFPA 303, *Fire Protection Standard for Marinas and Boatyards*, the small craft include recreational and commercial boats, yachts, and other craft that do not exceed 300 gross tons. For facilities that serve larger craft and ships, see NFPA 307, *Standard for the Construction and Fire Protection of Marine Terminals, Piers, and Wharves*. See Article 553 for requirements for floating buildings, including floating dwelling units.

The requirements of Article 555 apply to stand-alone boathouses except those constructed and used in association with a single-family dwelling. See 210.8(A)(8) for the GFCI protection requirement of 125-volt, single-phase, 15- and 20-ampere receptacles installed in or on boathouses located at a single-family dwelling. Electrical installations on docks and piers located at a single-family dwelling are not subject to the requirements of Article 555; however, all requirements in Chapters 1 through 4 for these outdoor, wet locations, including the GFCI requirements of 210.8(A)(3) for outdoor receptacles, are applicable.

### 555.2 Definitions

**Electrical Datum Plane.** The electrical datum plane is defined as follows:

- (1) In land areas subject to tidal fluctuation, the electrical datum plane is a horizontal plane 606 mm (2 ft) above the highest tide level for the area occurring under normal circumstances, that is, highest high tide.
- (2) In land areas not subject to tidal fluctuation, the electrical datum plane is a horizontal plane 606 mm (2 ft) above the highest water level for the area occurring under normal circumstances.
- (3) The electrical datum plane for floating piers and landing stages that are (a) installed to permit rise and fall response to water level, without lateral movement, and (b) that are so equipped that they can rise to the datum plane established for (1) or (2), is a horizontal plane 762 mm (30 in.) above the water level at the floating pier or landing stage and a minimum of 305 mm (12 in.) above the level of the deck.

Throughout Article 555, the physical location of electrical equipment is referenced to the electrical datum plane, which is used as a horizontal benchmark on land and on floating piers. The definition of *electrical datum plane* encompasses areas subject to tidal movement and areas in which the water level is affected only by conditions such as climate (rain or

snowfall) or by human intervention (the opening or closing of dams and floodgates). In either case, the term covers the normal highest water level, such as astronomical high tides. The term does not cover extremes due to natural or man-made disasters.

**Marine Power Outlet.** An enclosed assembly that can include equipment such as receptacles, circuit breakers, fused switches, fuses, watt-hour meter(s), distribution panelboards, and monitoring means approved for marine use.

### 555.3 Ground-Fault Protection

The main overcurrent protective device that feeds the marina shall have ground fault protection not exceeding 100 mA. Ground-fault protection of each individual branch or feeder circuit shall be permitted as a suitable alternative.

See the commentary following 553.4 regarding a similar requirement for ground-fault protection of the main overcurrent device supplying a floating building.

### 555.4 Distribution System

Yard and pier distribution systems shall not exceed 600 volts phase to phase.

### 555.5 Transformers

Transformers and enclosures shall be specifically approved for the intended location. The bottom of enclosures for transformers shall not be located below the electrical datum plane.

### 555.7 Location of Service Equipment

The service equipment for floating docks or marinas shall be located adjacent to, but not on or in, the floating structure.

The requirement covering service equipment location is similar to that in 553.4 for service equipment supplying floating buildings.

### 555.9 Electrical Connections

Electrical connections shall be located at least 305 mm (12 in.) above the deck of a floating pier. Conductor splices, within approved junction boxes, utilizing sealed wire connector systems listed and identified for submersion shall be permitted where located above the waterline but below the electrical datum plane for floating piers.

All electrical connections shall be located at least 305 mm (12 in.) above the deck of a fixed pier but not below the electrical datum plane.

The use of sealed, waterproof wire-to-wire splices in approved junction boxes that are below the datum plane but above the waterline are permitted where the connector systems are listed and identified for submersion.

### 555.10 Electrical Equipment Enclosures

**(A) Securing and Supporting.** Electrical equipment enclosures installed on piers above deck level shall be securely and substantially supported by structural members, independent of any conduit connected to them. If enclosures are not attached to mounting surfaces by means of external ears or lugs, the internal screw heads shall be sealed to prevent seepage of water through mounting holes.

**(B) Location.** Electrical equipment enclosures on piers shall be located so as not to interfere with mooring lines.

### 555.11 Circuit Breakers, Switches, Panelboards, and Marine Power Outlets

Circuit breakers and switches installed in gasketed enclosures shall be arranged to permit required manual operation without exposing the interior of the enclosure. All such enclosures shall be arranged with a weep hole to discharge condensation.

### 555.12 Load Calculations for Service and Feeder Conductors

General lighting and other loads shall be calculated in accordance with Part III of Article 220, and, in addition, the demand factors set forth in Table 555.12 shall be permitted

TABLE 555.12 Demand Factors

Number of Shore Power Receptacles	Sum of the Rating of the Receptacles (%)
1–4	100
5–8	90
9–14	80
15–30	70
31–40	60
41–50	50
51–70	40
≥71	30

Notes:

1. Where shore power accommodations provide two receptacles specifically for an individual boat slip and these receptacles have different voltages (for example, one 30 ampere, 125 volt and one 50 ampere, 125/250 volt), only the receptacle with the larger kilowatt demand shall be required to be calculated.
2. If the facility being installed includes individual kilowatt-hour submeters for each slip and is being calculated using the criteria listed in Table 555.12, the total demand amperes may be multiplied by 0.9 to achieve the final demand amperes.

for each service and/or feeder circuit supplying receptacles that provide shore power for boats. These calculations shall be permitted to be modified as indicated in notes (1) and (2) to Table 555.12. Where demand factors of Table 555.12 are applied, the demand factor specified in 220.61(B) shall not be permitted.

Informational Note: These demand factors may be inadequate in areas of extreme hot or cold temperatures with loaded circuits for heating, air-conditioning, or refrigerating equipment.

The demand factors from Table 555.12 are permitted but not mandatory. For receptacles that supply shore power for boats, the demand factors of Table 555.12 are the only ones permitted by the *Code*. It is not permitted to also add the demand factor from 220.61(B), because undersized conductors would result.

### 555.13 Wiring Methods and Installation

#### (A) Wiring Methods.

(1) **General.** Wiring methods of Chapter 3 shall be permitted where identified for use in wet locations.

(2) **Portable Power Cables.** Extra-hard usage portable power cables rated not less than 167°F (75°C), 600 volts; listed for both wet locations and sunlight resistance; and having an outer jacket rated to be resistant to temperature extremes, oil, gasoline, ozone, abrasion, acids, and chemicals shall be permitted as follows:

- (1) As permanent wiring on the underside of piers (floating or fixed)
- (2) Where flexibility is necessary as on piers composed of floating sections

The cable construction requirements are necessary due to the cables' exposure to extremes in weather conditions and to operational hazards such as oil and gasoline spills. Table 400.4 identifies Types G, PPE, and W as portable power cables suitable for extra-hard usage. The use of these cables on floating piers and docks provides the necessary degree of flexibility to compensate for tidal and wave action.

(3) **Temporary Wiring.** Temporary wiring, except as permitted by Article 590, shall not be used to supply power to boats.

#### (B) Installation.

(1) **Overhead Wiring.** Overhead wiring shall be installed to avoid possible contact with masts and other parts of boats being moved in the yard.

Conductors and cables shall be routed to avoid wiring closer than 6.0 m (20 ft) from the outer edge or any portion of the yard that can be used for moving vessels or stepping or unstepping masts.

(2) **Outside Branch Circuits and Feeders.** Outside branch circuits and feeders shall comply with Article 225 except that clearances for overhead wiring in portions of the yard other than those described in 555.13(B)(1) shall not be less than 5.49 m (18 ft) abovegrade.

(3) **Wiring Over and Under Navigable Water.** Wiring over and under navigable water shall be subject to approval by the authority having jurisdiction.

Approval for wiring over and under navigable water by the authority having jurisdiction may include federal and local agencies, such as the Army Corps of Engineers, the Coast Guard, or local harbor masters, who have specific authority over the waterways.

Informational Note: See NFPA 303-2011, *Fire Protection Standard for Marinas and Boatyards*, for warning sign requirements.

#### (4) Portable Power Cables.

(a) Where portable power cables are permitted by 555.13(A)(2), the installation shall comply with the following:

- (1) Cables shall be properly supported.
- (2) Cables shall be located on the underside of the pier.
- (3) Cables shall be securely fastened by nonmetallic clips to structural members other than the deck planking.
- (4) Cables shall not be installed where subject to physical damage.
- (5) Where cables pass through structural members, they shall be protected against chafing by a permanently installed oversized sleeve of nonmetallic material.

(b) Where portable power cables are used as permitted in 555.13(A)(2)(2), there shall be an approved junction box of corrosion-resistant construction with permanently installed terminal blocks on each pier section to which the feeder and feeder extensions are to be connected. A listed marine power outlet employing terminal blocks/bars shall be permitted in lieu of a junction box. Metal junction boxes and their covers, and metal screws and parts that are exposed externally to the boxes, shall be of corrosion-resistant materials or protected by material resistant to corrosion.

(5) **Protection.** Rigid metal conduit, reinforced thermosetting resin conduit (RTRC) listed for aboveground use, or rigid polyvinyl chloride (PVC) conduit suitable for the loca-

tion, shall be installed to protect wiring above decks of piers and landing stages and below the enclosure that it serves. The conduit shall be connected to the enclosure by full standard threads or fittings listed for use in damp or wet locations, as applicable.

### 555.15 Grounding

Wiring and equipment within the scope of this article shall be grounded as specified in Article 250 and as required by 555.15(A) through (E).

**(A) Equipment to Be Grounded.** The following items shall be connected to an equipment grounding conductor run with the circuit conductors in the same raceway, cable, or trench:

- (1) Metal boxes, metal cabinets, and all other metal enclosures
- (2) Metal frames of utilization equipment
- (3) Grounding terminals of grounding-type receptacles

**(B) Type of Equipment Grounding Conductor.** The equipment grounding conductor shall be an insulated copper conductor with a continuous outer finish that is either green or green with one or more yellow stripes. The equipment grounding conductor of Type MI cable shall be permitted to be identified at terminations. For conductors larger than 6 AWG, or where multiconductor cables are used, re-identification of conductors as allowed in 250.119(A)(2)(b) and (A)(2)(c) or 250.119(B)(2) and (B)(3) shall be permitted.

The use of an insulated equipment grounding conductor ensures a high-integrity path for ground-fault current. Because of the corrosive conditions in marinas and boatyards, metal raceways are not permitted to serve as the sole equipment grounding conductor.

**(C) Size of Equipment Grounding Conductor.** The insulated copper equipment grounding conductor shall be sized in accordance with 250.122 but not smaller than 12 AWG.

**(D) Branch-Circuit Equipment Grounding Conductor.** The insulated equipment grounding conductor for branch circuits shall terminate at a grounding terminal in a remote panelboard or the grounding terminal in the main service equipment.

**(E) Feeder Equipment Grounding Conductors.** Where a feeder supplies a remote panelboard, an insulated equipment grounding conductor shall extend from a grounding terminal in the service equipment to a grounding terminal in the remote panelboard.

### 555.17 Disconnecting Means for Shore Power Connection(s)

Disconnecting means shall be provided to isolate each boat from its supply connection(s).

**(A) Type.** The disconnecting means shall consist of a circuit breaker, switch, or both, and shall be properly identified as to which receptacle it controls.

**(B) Location.** The disconnecting means shall be readily accessible, located not more than 762 mm (30 in.) from the receptacle it controls, and shall be located in the supply circuit ahead of the receptacle. Circuit breakers or switches located in marine power outlets complying with this section shall be permitted as the disconnecting means.

### 555.19 Receptacles

Receptacles shall be mounted not less than 305 mm (12 in.) above the deck surface of the pier and not below the electrical datum plane on a fixed pier.

The location of enclosures for receptacles on fixed and floating piers is based on the electrical datum plane, as defined in 555.2. For floating piers, the datum plane is 12 in. above the deck of the pier. The purpose of this requirement is to prevent submersion of receptacle enclosures.

The requirements for enclosures in 555.19(A)(1) address their exposure to the severe weather (wind-driven rain) and environmental conditions (splashing from breaking waves or wakes) frequently encountered at marine locations.

#### (A) Shore Power Receptacles.

**(1) Enclosures.** Receptacles intended to supply shore power to boats shall be housed in marine power outlets listed as marina power outlets or listed for set locations, or shall be installed in listed enclosures protected from the weather or in listed weatherproof enclosures. The integrity of the assembly shall not be affected when the receptacles are in use with any type of booted or nonbooted attachment plug/cap inserted.

**(2) Strain Relief.** Means shall be provided where necessary to reduce the strain on the plug and receptacle caused by the weight and catenary angle of the shore power cord.

**(3) Branch Circuits.** Each single receptacle that supplies shore power to boats shall be supplied from a marine power outlet or panelboard by an individual branch circuit of the voltage class and rating corresponding to the rating of the receptacle.

**Informational Note:** Supplying receptacles at voltages other than the voltages marked on the receptacle may cause overheating or malfunctioning of connected equipment, for example, supplying single-phase, 120/240-volt, 3-wire loads from a 208Y/120-volt, 3-wire source.

The requirement that each single receptacle that supplies shore power to boats be supplied from an individual branch circuit can be met through the use of multiwire branch circuits derived from single-phase, 3-wire systems or from 3-phase, 4-wire systems. Although the ungrounded conductors of a multiwire branch circuit share the same grounded (neutral) conductor, this configuration can be considered multiple branch circuits in accordance with 210.4(A). See the commentary following 300.13(B) regarding device removal for multiwire branch circuits.

**(4) Ratings.** Shore power for boats shall be provided by single receptacles rated not less than 30 amperes.

**Informational Note:** For locking- and grounding-type receptacles for auxiliary power to boats, see NFPA 303-2011, *Fire Protection Standard for Marinas and Boatyards*.

(a) Receptacles rated 30 amperes and 50 amperes shall be of the locking and grounding type.

**Informational Note:** For various configurations and ratings of locking and grounding-type receptacles and caps, see ANSI/NEMA 18WD 6-1989, National Electrical Manufacturers Association's *Standard for Dimensions of Attachment Plugs and Receptacles*.

(b) Receptacles rated 60 amperes and 100 amperes shall be of the pin and sleeve type.

**Informational Note:** For various configurations and ratings of pin and sleeve receptacles, see ANSI/UL 1686, *UL Standard for Safety Pin and Sleeve Configurations*.

Single locking- and grounding-type receptacles and attachment caps are required for providing shore power to boats. The intent is to ensure proper connections and prevent unintentional disconnection of on-board equipment, such as bilge pumps, refrigerators, and so on. Exhibit 555.1 illustrates a chart of grounding-type locking plug and receptacle configurations. Exhibit 555.2 shows pin-and-sleeve-type receptacle configurations.

## **(B) Other Than Shore Power.**

**(1) Ground-Fault Circuit-Interrupter (GFCI) Protection for Personnel.** Fifteen- and 20-ampere, single-phase, 125-volt receptacles installed outdoors, in boathouses, in

**EXHIBIT 555.1** Typical configurations for single locking- and grounding-type receptacles and attachment plug caps used to provide shore power for boats in marinas and boatyards. These configurations are 30 amperes to 50 amperes.

buildings or structures used for storage, maintenance, or repair where portable electrical hand tools, electrical diagnostic equipment, or portable lighting equipment are to be used shall be provided with GFCI protection for personnel. Receptacles in other locations shall be protected in accordance with 210.8(B).

Fifteen- and 20-ampere, single-phase, 125-volt receptacles, other than those supplying shore power to boats and used for maintenance or other purposes at piers, wharves, and so on, may be of the general-purpose, nonlocking type and are required to be protected by GFCIs. See Exhibit 210.8 for an example of a GFCI receptacle.

**(2) Marking.** Receptacles other than those supplying shore power to boats shall be permitted to be housed in marine power outlets with the receptacles that provide shore power to boats, provided they are marked to clearly indicate that they are not to be used to supply power to boats.

**EXHIBIT 555.2** Typical configurations for safety pin-and-sleeve-type receptacles, plugs, connectors, and power inlets used to provide shore power for boats in marinas and boatyards. These configurations are 60 amperes or 100 amperes.

## 555.21 Motor Fuel Dispensing Stations — Hazardous (Classified) Locations

Additional requirements for fuel dispensing facilities at marinas and boatyards are in Article 514. In addition to the requirements in Article 514, NFPA 303, *Fire Protection Standard for Marinas and Boatyards*, and NFPA 30A, *Code for Motor Fuel Dispensing Facilities and Repair Garages*, contain requirements pertaining to gasoline dispensing facilities and operations.

**(A) General.** Electrical wiring and equipment located at or serving motor fuel dispensing locations shall comply with Article 514 in addition to the requirements of this article. All electrical wiring for power and lighting shall be installed on the side of the wharf, pier, or dock opposite from the liquid piping system.

**Informational Note:** For additional information, see NFPA 303-2011, *Fire Protection Standard for Marinas and Boatyards*, and NFPA 30A-2008, *Motor Fuel Dispensing Facilities and Repair Garages*.

**(B) Classification of Class I, Division 1 and 2 Areas.** The following criteria shall be used for the purposes of applying Table 514.3(B)(1) and Table 514.3(B)(2) to motor fuel dispensing equipment on floating or fixed piers, wharfs, or docks.

**(1) Closed Construction.** Where the construction of floating docks, piers, or wharfs is closed so that there is no space between the bottom of the dock, pier, or wharf and the water, such as concrete enclosed expanded foam or similar construction, and having integral service boxes with supply chases, the following shall apply:

(a) The space above the surface of the floating dock, pier, or wharf shall be a Class I, Division 2 location with distances as identified in Table 514.3(B)(1), Dispenser and Outdoor.

(b) The space below the surface of the floating dock, pier, or wharf, having areas or enclosures such as tubs, voids, pits, vaults, boxes, depressions, fuel piping chases, or similar spaces where flammable liquid or vapor can accumulate, shall be a Class I, Division 1 location.

*Exception No. 1: Dock, pier, or wharf sections that do not support fuel dispensers and abut but are 6.0 m (20 ft) or more from dock sections that support fuel dispenser(s) shall be permitted to be Class I, Division 2 where documented air space is provided between dock sections to permit flammable liquids or vapors to dissipate and not travel to these dock sections. Such documentation shall comply with 500.4(A).*

*Exception No. 2: Dock, pier, or wharf sections that do not support fuel dispensers and do not directly abut sections that support fuel dispensers shall be permitted to be unclassified where documented air space is provided and where flammable liquids or vapors cannot travel to these dock sections. Such documentation shall comply with 500.4(A).*

**(2) Open Construction.** Where the construction of piers, wharfs, or docks is open, such as decks built on stringers

supported by pilings, floats, pontoons, or similar construction, the following shall apply:

(a) The area 450 mm (18 in) above the surface of the dock, pier, or wharf and extending 6.0 m (20 ft) horizontally in all directions from the outside edge of the dispenser and down to the water level shall be Class 1, Division 2.

(b) Enclosures such as tubs, voids, pits, vaults, boxes, depressions, piping chases, or similar spaces where flammable liquids or vapors can accumulate within 6.0 m (20 ft) of the dispenser shall be a Class I, Division 1 location.

### 555.22 Repair Facilities — Hazardous (Classified) Locations

Electrical wiring and equipment located at facilities for the repair of marine craft containing flammable or combustible liquids or gases shall comply with Article 511 in addition to the requirements of this article.

Facilities for the repair of marine craft that contain flammable or combustible liquids or gases must also comply with the requirements of Article 511.

### 555.23 Marine Hoists, Railways, Cranes, and Monorails

Motors and controls for marine hoists, railways, cranes, and monorails shall not be located below the electrical datum plane. Where it is necessary to provide electric power to a mobile crane or hoist in the yard and a trailing cable is utilized, it shall be a listed portable power cable rated for the conditions of use and be provided with an outer jacket of distinctive color for safety.

### 590.1 Scope

The provisions of this article apply to temporary electric power and lighting installations.

Temporary installations are temporary as approved by the authority having jurisdiction. Article 590 applies to any temporary installation whether it is at a transient or permanent location. The installation could be at a construction site, a box store parking lot, or the local craft fair in a field.

### 590.2 All Wiring Installations

**(A) Other Articles.** Except as specifically modified in this article, all other requirements of this *Code* for permanent wiring shall apply to temporary wiring installations.

Temporary installations of electrical equipment must be installed in accordance with all applicable permanent installation requirements except as modified by the rules in this article. For example, the requirements of 300.15 specify that a box or other enclosure must be used where splices are made. This rule is amended by 590.4(G), which, for construction sites, permits splices to be made in multiconductor cords and cables without the use of a box.

**(B) Approval.** Temporary wiring methods shall be acceptable only if approved based on the conditions of use and any special requirements of the temporary installation.

Temporary wiring methods are approved based on criteria such as length of time in service, severity of physical abuse, exposure to weather, and other special requirements. Special requirements may range from tunnel construction projects and tent cities constructed after a natural disaster to flammable hazardous material reclamation projects.

### 590.3 Time Constraints

**(A) During the Period of Construction.** Temporary electric power and lighting installations shall be permitted during the period of construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities.

**(B) 90 Days.** Temporary electric power and lighting installations shall be permitted for a period not to exceed 90 days for holiday decorative lighting and similar purposes.

The 90-day time limit applies only to temporary electrical installations associated with holiday displays. Construction and emergency and test temporary wiring installations are not bound by this time limit.

**(C) Emergencies and Tests.** Temporary electric power and lighting installations shall be permitted during emergencies and for tests, experiments, and developmental work.

**(D) Removal.** Temporary wiring shall be removed immediately upon completion of construction or purpose for which the wiring was installed.

Because temporary wiring installations may not meet all of the requirements for a permanent installation due to the modifications permitted by Article 590, all temporary wiring not only must be disconnected but also removed from the building, structure, or other location of installation.

### 590.4 General

**(A) Services.** Services shall be installed in conformance with Parts I through VIII of Article 230, as applicable.

**(B) Feeders.** Overcurrent protection shall be provided in accordance with 240.4, 240.5, 240.100, and 240.101. Conductors shall be permitted within cable assemblies or within multiconductor cords or cables of a type identified in Table 400.4 for hard usage or extra-hard usage. For the purpose of this section, Type NM and Type NMC cables shall be permitted to be used in any dwelling, building, or structure without any height limitation or limitation by building construction type and without concealment within walls, floors, or ceilings.

Type NM and Type NMC cable may be used in any building or structure regardless of building height and construction type in which the cable is used.

Temporary feeders are permitted to be cable assemblies, multiconductor cords, or single-conductor cords. Cords used

as feeders must be identified for hard or extra-hard usage according to Table 400.4. Individual conductors, as described in Table 310.104(A), are not permitted as open conductors but, rather, must be part of a cable assembly or used in a raceway system. Open or individual conductor feeders are permitted only during emergencies or tests.

All temporary wiring methods must be approved by the authority having jurisdiction. [See 590.2(B).]

*Exception: Single insulated conductors shall be permitted where installed for the purpose(s) specified in 590.3(C), where accessible only to qualified persons.*

**(C) Branch Circuits.** All branch circuits shall originate in an approved power outlet, switchboard or panelboard, motor control center, or fused switch enclosure. Conductors shall be permitted within cable assemblies or within multiconductor cord or cable of a type identified in Table 400.4 for hard usage or extra-hard usage. Conductors shall be protected from overcurrent as provided in 240.4, 240.5, and 240.100. For the purposes of this section, Type NM and Type NMC cables shall be permitted to be used in any dwelling, building, or structure without any height limitation or limitation by building construction type and without concealment within walls, floors, or ceilings.

Type NM and NMC cables are permitted as temporary wiring in any building or structure regardless of the height or construction type of the building in which the cable is used.

The basic requirement for safety in 590.4(C) is that temporary wiring be located and installed so that it will not be physically damaged. Temporary wiring, per 590.2(A), must be installed in accordance with the appropriate Chapter 3 article for the wiring method employed (unless modified in Article 590). Note that hard-usage or extra-hard-usage extension cords are permitted to be laid on the floor.

*Exception: Branch circuits installed for the purposes specified in 590.3(B) or 590.3(C) shall be permitted to be run as single insulated conductors. Where the wiring is installed in accordance with 590.3(B), the voltage to ground shall not exceed 150 volts, the wiring shall not be subject to physical damage, and the conductors shall be supported on insulators at intervals of not more than 3.0 m (10 ft); or, for festoon lighting, the conductors shall be so arranged that excessive strain is not transmitted to the lampholders.*

### (D) Receptacles.

**(1) All Receptacles.** All receptacles shall be of the grounding type. Unless installed in a continuous metal raceway that qualifies as an equipment grounding conductor in accordance

with 250.118 or a continuous metal-covered cable that qualifies as an equipment grounding conductor in accordance with 250.118, all branch circuits shall include a separate equipment grounding conductor, and all receptacles shall be electrically connected to the equipment grounding conductor(s). Receptacles on construction sites shall not be installed on **any** branch **circuit** that **supplies** temporary lighting.

It is required to separate ungrounded conductors for lighting and receptacle loads so that the activation of a fuse, circuit breaker, or GFCI, due to a fault or equipment overload, does not de-energize the lighting circuit. Metal cables or raceways must be continuous and qualify as an equipment grounding conductor. If the metal raceway or metal cable is not continuous or does not qualify as an equipment grounding conductor, a separate equipment grounding conductor must be installed.

**(2) Receptacles in Wet Locations.** All 15- and 20-ampere, 125- and 250-volt receptacles installed in a wet location shall comply with 406.9(B)(1).

**(E) Disconnecting Means.** Suitable disconnecting switches or plug connectors shall be installed to permit the disconnection of all ungrounded conductors of each temporary circuit. Multiwire branch circuits shall be provided with a means to disconnect simultaneously all ungrounded conductors at the power outlet or panelboard where the branch circuit originated. Identified handle ties shall be permitted.

**(F) Lamp Protection.** All lamps for general illumination shall be protected from accidental contact or breakage by a suitable luminaire or lampholder with a guard.

Brass shell, paper-lined sockets, or other metal-cased sockets shall not be used unless the shell is grounded.

**(G) Splices.** On construction sites, a box shall not be required for splices or junction connections where the circuit conductors are multiconductor cord or cable assemblies, provided that the equipment grounding continuity is maintained with or without the box. See 110.14(B) and 400.9. A box, conduit body, or terminal fitting having a separately bushed hole for each conductor shall be used wherever a change is made to a conduit or tubing system or a metal-sheathed cable system.

**(H) Protection from Accidental Damage.** Flexible cords and cables shall be protected from accidental damage. Sharp corners and projections shall be avoided. Where passing through doorways or other pinch points, protection shall be provided to avoid damage.

Flexible cords and cables, because of the nature of their use, are permitted to pass through doorways, unlike the requirement in 400.8(3).

**(I) Termination(s) at Devices.** Flexible cords and cables entering enclosures containing devices requiring termination shall be secured to the box with fittings designed for the purpose.

**(J) Support.** Cable assemblies and flexible cords and cables shall be supported in place at intervals that ensure that they will be protected from physical damage. Support shall be in the form of staples, cable ties, straps, or similar type fittings installed so as not to cause damage. Vegetation shall not be used for support of overhead spans of branch circuits or feeders.

According to 590.4(J), temporary wiring methods do not have to be supported in accordance with the permanent installation requirements (from Chapter 3) for the particular wiring method. Adequate support is needed only to minimize the possibility of damage to the wiring method during its temporary period of use. The use of vegetation as a support structure for overhead spans of branch-circuit and feeder conductors is not permitted.

The exception to 590.4(J) allows holiday lighting to be installed and supported by trees for a period of not more than 90 days, provided the wiring is arranged with proper strain relief devices, tension take-up devices, or other means to prevent damage to the conductors from the tree swaying. It should be noted that all temporary wiring must be removed at the end of the temporary period or project.

*Exception: For holiday lighting in accordance with 590.3(B), where the conductors or cables are arranged with strain relief devices, tension take-up devices, or other approved means to avoid damage from the movement of the live vegetation, trees shall be permitted to be used for support of overhead spans of branch-circuit conductors or cables.*

## 590.5 Listing of Decorative Lighting

Decorative lighting used for holiday lighting and similar purposes, in accordance with 590.3(B), shall be listed.

## 590.6 Ground-Fault Protection for Personnel

Ground-fault protection for personnel for all temporary wiring installations shall be provided to comply with 590.6(A) and (B). This section shall apply only to temporary wiring installations used to supply temporary power to equipment

used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities. This section shall apply to power derived from an electric utility company or from an on-site-generated power source.

**(A) Receptacle Outlets.** Temporary receptacle installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities shall comply with the requirements of 590.6(A)(1) through (A)(3), as applicable.

*Exception: In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified personnel are involved, an assured equipment grounding conductor program as specified in 590.6(B)(2) shall be permitted for only those receptacle outlets used to supply equipment that would create a greater hazard if power were interrupted or having a design that is not compatible with GFCI protection.*

**(1) Receptacle Outlets Not Part of Permanent Wiring.** All 125-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets that are not a part of the permanent wiring of the building or structure and that are in use by personnel shall have ground-fault circuit-interrupter protection for personnel.

**(2) Receptacle Outlets Existing or Installed as Permanent Wiring.** Ground-fault circuit-interrupter protection for personnel shall be provided for all 125-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets installed or existing as part of the permanent wiring of the building or structure and used for temporary electric power. Listed cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted.

**(3) Receptacles on 15-kW or less Portable Generators.** All 125-volt and 125/250-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets that are a part of a 15-kW or smaller portable generator shall have listed ground-fault circuit-interrupter protection for personnel. All 15- and 20-ampere, 125- and 250-volt receptacles, including those that are part of a portable generator, used in a damp or wet location shall comply with 406.9(A) and (B). Listed cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted for use with 15-kW or less portable generators manufactured or remanufactured prior to January 1, 2011.

The requirements for GFCI protection are based on the type of wiring being used to provide temporary power. For example, receptacles at a construction site may provide power via temporary wiring or via the permanent wiring of the structure. The latter may occur when the premises wiring is available prior to project completion. This requirement applies even where the final occupancy would not require GFCI protection for the receptacle being utilized.

Section 590.6(A)(3) specifically addresses GFCI protection for small generators that are common at construction sites. Generators manufactured prior to January 1, 2011 were not required to provide this protection. Therefore, listed cord sets or other devices are permitted to provide GFCI protection. Exhibits 590.1 through 590.4 show some examples of ways to implement the ground-fault circuit interrupter requirements for temporary installations.

**EXHIBIT 590.1** A raintight, portable GFCI with open neutral protection that is designed for use on the line end of a flexible cord. (Courtesy of Legrand/Pass & Seymour®)

**EXHIBIT 590.2** A temporary power outlet unit commonly used on construction sites with a variety of configurations, including GFCI protection. (Courtesy of Hubbell Wiring Device - Kellems)

**EXHIBIT 590.3** A watertight plug and connector used to prevent tripping of GFCI protective devices in wet or damp weather. (Courtesy of Hubbell Wiring Device - Kellems)

**EXHIBIT 590.4** A 15-ampere duplex receptacle with integral GFCI that also protects downstream loads. (Courtesy of Legrand/Pass & Seymour®)

**(B) Use of Other Outlets.** For temporary wiring installations, receptacles, other than those covered by 590.6(A)(1) through (A)(3) used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, or equipment, or similar activities, shall have protection in accordance with (B)(1) or the assured equipment grounding conductor program in accordance with (B)(2).

**(1) GFCI Protection.** Ground-fault circuit-interrupter protection for personnel.

**(2) Assured Equipment Grounding Conductor Program.** A written assured equipment grounding conductor program continuously enforced at the site by one or more designated persons to ensure that equipment grounding conductors for all cord sets, receptacles that are not a part of the

permanent wiring of the building or structure, and equipment connected by cord and plug are installed and maintained in accordance with the applicable requirements of 250.114, 250.138, 406.4(C), and 590.4(D).

(a) The following tests shall be performed on all cord sets, receptacles that are not part of the permanent wiring of the building or structure, and cord-and-plug-connected equipment required to be connected to an equipment grounding conductor:

- (1) All equipment grounding conductors shall be tested for continuity and shall be electrically continuous.
- (2) Each receptacle and attachment plug shall be tested for correct attachment of the equipment grounding conductor. The equipment grounding conductor shall be connected to its proper terminal.
- (3) All required tests shall be performed as follows:
  - a. Before first use on site
  - b. When there is evidence of damage
  - c. Before equipment is returned to service following any repairs
  - d. At intervals not exceeding 3 months

(b) The tests required in item (2)(a) shall be recorded and made available to the authority having jurisdiction.

The more severe environmental conditions encountered during activities, such as construction or demolition, subject personnel to an elevated exposure to electrical shock or electrocution hazards. The requirement of 590.6(A) for GFCI protection of all temporarily installed, 125-volt, single-phase, 15-, 20-, and 30-ampere receptacles is intended to protect personnel using these receptacles from shock hazards that may be encountered during construction and maintenance activities.

The exception to 590.6(A) is limited in scope and application. The exception applies only to those industrial occupancies in which qualified persons will be using 125-volt, single-phase, 15-, 20-, and 30-ampere receptacles. Additionally, either the nature of the equipment being supplied by these receptacles has to be of such importance that the hazard of power interruption outweighs the benefits of GFCI protection or the equipment has been demonstrated to be incompatible with the proper operation of GFCI protective devices. In those instances where the conditions specified by the exception are present, the use of the assured equipment grounding conductor program specified in 590.6(B)(2) is permitted. An electrically operated air supply for personnel working in toxic environments is an example of where the loss of power is the greater hazard. Some electrically operated testing equipment has proved to be incompatible with GFCI protection.

Receptacle configurations, other than the 125-volt, single-phase, 15-, 20-, and 30-ampere types, must also be GFCI protected or installed and maintained in accordance with the assured equipment grounding conductor program.

According to OSHA 29 CFR 1926.404(b)(1)(iii):

The employer shall establish and implement an assured equipment grounding conductor program on construction sites covering all cord sets, receptacles which are not a part of the building or structure, and equipment connected by cord and plug which are available for use or used by employees. This program shall comply with the following minimum requirements:

(A) A written description of the program, including

the specific procedures adopted by the employer, shall be available at the jobsite for inspection and copying by the Assistant Secretary and any affected employee.

(B) The employer shall designate one or more competent persons.

These OSHA requirements are very similar to the present *NEC* requirements for an assured grounding program.

### 590.7 Guarding

For wiring over 600 volts, nominal, suitable fencing, barriers, or other effective means shall be provided to limit access only to authorized and qualified personnel.

## I. General

### 600.1 Scope

This article covers the installation of conductors, equipment, and field wiring for electric signs and outline lighting, regardless of voltage. All installations and equipment using neon tubing, such as signs, decorative elements, skeleton tubing, or art forms, are covered by this article.

Article 600 provides construction and installation requirements for electric signs and outline lighting. Covered under these requirements are signs of the fixed, stationary, and portable self-contained type. Electric signs and outline lighting frequently include sources of illumination identical to those of luminaires; however, the structure and electrical operation of many of today's electric signs are far more complex than simply a set of fluorescent lamps within an enclosure. The

terms *electric sign* and *outline lighting* as defined in Article 100 clearly distinguish the function and use of equipment covered by the requirements of Article 600 from the equipment covered by the requirements of Article 410. Note, however, that 600.3(B) does defer to the requirements of Chapters 3 and 4 where individual listed luminaires are used for outline lighting.

Neon tubing is used extensively in today's sign industry, and its uses go far beyond the typical electric sign or outline lighting applications. Decorative and artistic use of neon tubing is extremely popular, and it is being installed indoors and outdoors to enhance the appearance of buildings and structures. Neon art forms are mounted on enclosures, sign bodies, and other support structures, or they may be field-installed skeleton tubing. Depending on how these neon art forms are constructed and installed, they are subject to the requirements of either Part I or Parts I and II of Article 600. All neon installations and applications are covered by the requirements of Article 600. Light-emitting diode (LED) sign illumination systems are also covered by the requirements in Article 600.

**Informational Note:** Sign and outline lighting illumination systems include, but are not limited to, cold cathode neon tubing, high-intensity discharge lamps (HID), fluorescent or incandescent lamps, light-emitting diodes (LEDs), and electroluminescent and inductance lighting.

## 600.2 Definitions

**Electric-Discharge Lighting.** Systems of illumination utilizing fluorescent lamps, high-intensity discharge (HID) lamps, or neon tubing.

**LED Sign Illumination System.** A complete lighting system for use in signs and outline lighting consisting of light-emitting diode (LED) light sources, power supplies, wire, and connectors to complete the installation.

**Neon Tubing.** Electric-discharge luminous tubing that is manufactured into shapes to illuminate signs, form letters, parts of letters, skeleton tubing, outline lighting, other decorative elements, or art forms and filled with various inert gases.

**Informational Note:** Where used in illumination systems for signs, outline lighting or skeleton tubing, decorative elements, or art forms, cold cathode luminous tubes are neon tubing as defined by this article.

**Section Sign.** A sign or outline lighting system, shipped as subassemblies, that requires field-installed wiring between the subassemblies to complete the overall sign. The subassemblies are either physically joined to form a single sign unit or are installed as separate remote parts of an overall sign.

In many cases, the size or other logistical factors affecting the installation of an electric sign dictate that it be constructed in multiple factory-wired subassemblies that can be assembled at the sign-installation location. The subassemblies may be physically joined to form a single sign unit, or they may be installed as separate parts of an overall sign. The definition of *section sign* clarifies that the multiple parts of a section sign are referred to as subassemblies and the only field wiring involved is the connections between subassemblies and connection of the subassemblies to the power source.

The power source may be a line voltage branch circuit or the secondary wiring from a sign power supply. In accordance with 600.3, section signs are required to be listed. In accordance with UL 48, *Electric Signs*, each subassembly is provided with installation instructions containing detailed information on the mechanical and electrical connections that are performed when the subassemblies are installed to form the completed section sign. A section sign, transported in multiple subassemblies and then field assembled into a single sign, is shown in Exhibit 600.1. The size of this sign requires that it be constructed in multiple sections and assembled at the installation site.

**EXHIBIT 600.1** Example of a section sign where the subassemblies are joined together to form a single sign. (Courtesy of Kieffer & Co. Inc.)

**Sign Body.** A portion of a sign that may provide protection from the weather but is not an electrical enclosure.

**Skeleton Tubing.** Neon tubing that is itself the sign or outline lighting and is not attached to an enclosure or sign body.

### 600.3 Listing

Electric signs, section signs, and outline lighting, fixed, mobile, or portable, regardless of voltage, shall be listed and

installed in conformance with that listing, unless otherwise approved by special permission.

**(A) Field-Installed Skeleton Tubing.** Field-installed skeleton tubing shall not be required to be listed where installed in conformance with this *Code*.

**(B) Outline Lighting.** Outline lighting shall not be required to be listed as a system when it consists of listed luminaires wired in accordance with Chapter 3.

Section 600.3 requires listing of electric signs and outline lighting unless the sign or lighting is approved through special permission (i.e., written consent) from the authority having jurisdiction. Electric signs come in many different types and configurations and, depending on their construction and operation, contain electrical components such as transformers, ballasts, fluorescent lamps, channel letters, plastic faces, neon tubing, glass tube supports, raceways, glass cups or insulating boots (if provided), and in some cases factory-installed disconnecting means. Like other requirements in the *NEC* specifying listed products, construction and evaluation of electric signs in accordance with a recognized product standard and field installation in accordance with instructions provided as part of the product listing help ensure that electrical equipment does not pose a shock or fire hazard.

Section signs, which may be large signs constructed in multiple sections or remote wired letters, are often transported in several parts from the factory to the location where they are to be field-assembled into a single sign or into multiple remote letters, symbols, or other characters that are viewed as a single sign. The individual subassemblies are wired together in the field to form the completed section sign. The applicable product standard (UL 48; see Informative Annex A) specifies that all necessary materials and detailed installation instructions, often including wiring and assembly diagrams, be included with each subassembly.

Skeleton tubing (neon tubing mounted directly on a building) that has not been listed is permitted to be field-installed by 600.3(A), provided the installation is done in accordance with the applicable requirements of the *Code*. In 600.3(B), installation of unlisted outline lighting systems constructed of listed luminaires is permitted, provided the installation is performed in accordance with Chapters 3 and 4 of the *Code*.

### 600.4 Markings

**(A) Signs and Outline Lighting Systems.** Signs and outline lighting systems shall be marked with the manufacturer's name, trademark, or other means of identification; and input voltage and current rating.

**(B) Signs with Lampholders for Incandescent Lamps.**

Signs and outline lighting systems with lampholders for incandescent lamps shall be marked to indicate the maximum allowable lamp wattage per lampholder. The markings shall be permanently installed, in letters at least 6 mm (¼ in.) high, and shall be located where visible during relamping.

**(C) Visibility.** The markings required in 600.4(A) and listing labels shall not be required to be visible after installation but shall be permanently applied in a location visible during servicing.

The markings required by 600.4(A) and the label of the qualified electrical testing laboratory that has listed the sign are not required to be visible on the exterior of the sign after the installation has been completed. These markings are required to be visible during servicing of the sign, and this section does not preclude the markings from being placed within the interior of a sign body or sign equipment enclosure. Markings installed on the exterior of an electric sign are required by 600.4(D) to be suitable for the environment in which they are installed so that the information is available for as long as the sign is in use.

**(D) Durability.** Marking labels shall be permanent, durable and, when in wet locations, shall be weatherproof.

**(E) Section Signs.** Section signs shall be marked to indicate that field-wiring and installation instructions are required.

**600.5 Branch Circuits**

**(A) Required Branch Circuit.** Each commercial building and each commercial occupancy accessible to pedestrians shall be provided with at least one outlet in an accessible location at each entrance to each tenant space for sign or outline lighting system use. The outlet(s) shall be supplied by a branch circuit rated at least 20 amperes that supplies no other load. Service hallways or corridors shall not be considered accessible to pedestrians.

Electric signs and outline lighting are used extensively by commercial enterprises to attract the attention of consumers. The need for an accessible provision to facilitate the connection of an electric sign at a commercial building is covered by 600.5(A). A 20-ampere outlet on a circuit dedicated to the purpose of supplying an electric sign(s) is required to be installed at the entrance to single-occupant commercial buildings and at the entrance to each occupancy of multiple-occupant commercial buildings (e.g., shopping malls). This

requirement is not contingent on whether an electric sign will be installed at the time an occupant moves into a commercial space, since it is not uncommon for an electric sign to be installed after the space is occupied or when a new occupant moves into an existing space. For branch-circuit, feeder, and service calculations, a minimum load of 1200 VA per 20-ampere sign branch circuit is required to be added. Due to the nature of their use, electric signs are considered to be continuous loads, and as such, the conductors and overcurrent devices supplying sign loads have to be adjusted in size accordingly.

**(B) Rating.** Branch circuits that supply signs shall be rated in accordance with 600.5(B)(1) or (B)(2) and shall be considered to be continuous loads for the purposes of calculations.

**(1) Neon Signs.** Branch circuits that supply neon tubing installations shall not be rated in excess of 30 amperes.

**(2) All Other Signs.** Branch circuits that supply all other signs and outline lighting systems shall be rated not to exceed 20 amperes.

Branch circuits that supply electric signs are limited by 600.5(B)(1) and (B)(2) to ratings of 20 and 30 amperes, respectively. Large signs often have load requirements that exceed the ratings permitted by 600.5(B). It is typical for signs having large electrical loads to be supplied by a feeder that in turn supplies branch circuits operating within the parameters specified by this requirement. In some cases, particularly for signs installed along highways, a utility service dedicated to the sign is provided. The rating of the feeder or service is not limited by this requirement. Because sign loads are continuous, the conductors and overcurrent protective devices for branch circuits, feeders, and services supplying sign loads have to be sized in accordance with the rules for continuous loads contained in Articles 210, 215, and 230.

**(C) Wiring Methods.** Wiring methods used to supply signs shall comply with 600.5(C)(1), (C)(2), and (C)(3).

**(1) Supply.** The wiring method used to supply signs and outline lighting systems shall terminate within a sign, an outline lighting system enclosure, a suitable box, or a conduit body.

**(2) Enclosures as Pull Boxes.** Signs and transformer enclosures shall be permitted to be used as pull or junction boxes for conductors supplying other adjacent signs, outline

lighting systems, or floodlights that are part of a sign and shall be permitted to contain both branch and secondary circuit conductors.

**(3) Metal or Nonmetallic Poles.** Metal or nonmetallic poles used to support signs shall be permitted to enclose supply conductors, provided the poles and conductors are installed in accordance with 410.30(B).

### 600.6 Disconnects

Each sign and outline lighting system, feeder circuit or branch circuit supplying a sign, outline lighting system, or skeleton tubing shall be controlled by an externally operable switch or circuit breaker that opens all ungrounded conductors and controls no other load. The switch or circuit breaker shall open all ungrounded conductors simultaneously on multi-wire branch circuits in accordance with 210.4(B). Signs and outline lighting systems located within fountains shall have the disconnect located in accordance with 680.12.

*Exception No. 1: A disconnecting means shall not be required for an exit directional sign located within a building.*

*Exception No. 2: A disconnecting means shall not be required for cord-connected signs with an attachment plug.*

#### (A) Location.

**(1) Within Sight of the Sign.** The disconnecting means shall be within sight of the sign or outline lighting system that it controls. Where the disconnecting means is out of the line of sight from any section that is able to be energized, the disconnecting means shall be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.

Section 600.6(A)(1) covers sign installations where the branch circuit or feeder is run directly to the sign. Each branch circuit or feeder supplying a sign must have an externally operable switch or circuit breaker to open the ungrounded conductors. Two options are permitted for locating the sign disconnecting means. The disconnecting means is required either to be located within sight of the sign or to be equipped with the provision to lock it in the open position. Exhibit 600.2 depicts a sign with two supply circuits, which could be feeders or branch circuits. Each circuit is provided with an externally operable switch located within sight of the sign.

Exhibit 600.3 illustrates three compliant alternatives. The supply circuit disconnecting means shown in Example 1

**EXHIBIT 600.2** Supply circuit disconnecting means located at or on an electric sign.

is externally operable and located at and within sight of the sign. The disconnecting means in Example 2 is externally operable, and its location, though not at or on the sign, is acceptable because it meets the Article 100 definition of *within sight*. Where the disconnecting means is not located within sight of the sign, as shown in Example 3, it is required to be located within sight of the controller and must be capable of being locked in the open position.

**(2) Within Sight of the Controller.** The following shall apply for signs or outline lighting systems operated by electronic or electromechanical controllers located external to the sign or outline lighting system:

- (1) The disconnecting means shall be permitted to be located within sight of the controller or in the same enclosure with the controller.
- (2) The disconnecting means shall disconnect the sign or outline lighting system and the controller from all ungrounded supply conductors.
- (3) The disconnecting means shall be designed such that no pole can be operated independently and shall be capable of being locked in the open position. The provisions for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.

For signs or outline lighting systems operated by mechanical or electromechanical controllers located external to the sign,

**EXHIBIT 600.3** Three acceptable methods of providing the disconnecting means for an electric sign.

the disconnecting means is required to be located within sight of or in the same enclosure as the controller and must be capable of being locked in the open position. This requirement enhances safe working conditions for persons servicing the controller or the sign. The means to lock the switch or circuit breaker in the open position must be an integral part of the enclosure or be an accessory that is not readily removed from the switch or circuit breaker. Portable locking mechanisms that are intended for temporary applications are not acceptable means of complying with the requirements of 600.6(A) and (B).

**(B) Control Switch Rating.** Switches, flashers, and similar devices controlling transformers and electronic power

supplies shall be rated for controlling inductive loads or have a current rating not less than twice the current rating of the transformer.

Informational Note: See 404.14 for rating of snap switches.

A switching device that controls the primary circuit of a transformer supplying a luminous gas tube is subject to a highly inductive load that causes severe arcing of its contacts. Therefore, the switch or flasher is required to be rated for the inductive load (a general-use ac snap switch used in accordance with 404.14 is permitted), or it must have a current rating that is at least twice the current rating of the transformer it controls.

## 600.7 Grounding and Bonding

### (A) Grounding.

**(1) Equipment Grounding.** Signs and metal equipment of outline lighting systems shall be grounded by connection to the equipment grounding conductor of the supply branch circuit(s) or feeder using the types of equipment grounding conductors specified in 250.118.

*Exception: Portable cord-connected signs shall not be required to be connected to the equipment grounding conductor where protected by a system of double insulation or its equivalent. Double insulated equipment shall be distinctively marked.*

**(2) Size of Equipment Grounding Conductor.** The equipment grounding conductor size shall be in accordance with 250.122 based on the rating of the overcurrent device protecting the branch circuit or feeder conductors supplying the sign or equipment.

**(3) Connections.** Equipment grounding conductor connections shall be made in accordance with 250.130 and in a method specified in 250.8.

**(4) Auxiliary Grounding Electrode.** Auxiliary grounding electrode(s) shall be permitted for electric signs and outline lighting systems covered by this article and shall meet the requirements of 250.54.

**(5) Metal Building Parts.** Metal parts of a building shall not be permitted as a secondary return conductor or an equipment grounding conductor.

### (B) Bonding.

**(1) Bonding of Metal Parts.** Metal parts and equipment of signs and outline lighting systems shall be bonded together and to the associated transformer or power-supply equipment grounding conductor of the branch circuit or feeder supplying the sign or outline lighting system and shall meet the requirements of 250.90.

*Exception: Remote metal parts of a section sign or outline lighting system only supplied by a remote Class 2 power supply shall not be required to be bonded to an equipment grounding conductor.*

**(2) Bonding Connections.** Bonding connections shall be made in accordance with 250.8.

**(3) Metal Building Parts.** Metal parts of a building shall not be permitted to be used as a means for bonding metal parts and equipment of signs or outline lighting systems to-

gether or to the transformer or power-supply equipment grounding conductor of the supply circuit.

**(4) Flexible Metal Conduit Length.** Listed flexible metal conduit or listed liquidtight flexible metal conduit that encloses the secondary circuit conductor from a transformer or power supply for use with neon tubing shall be permitted as a bonding means if the total accumulative length of the conduit in the secondary circuit does not exceed 30 m (100 ft).

**(5) Small Metal Parts.** Small metal parts not exceeding 50 mm (2 in.) in any dimension, not likely to be energized, and spaced at least 19 mm ( $\frac{3}{4}$  in.) from neon tubing, shall not require bonding.

**(6) Nonmetallic Conduit.** Where listed nonmetallic conduit is used to enclose the secondary circuit conductor from a transformer or power supply and a bonding conductor is required, the bonding conductor shall be installed separate and remote from the nonmetallic conduit and be spaced at least 38 mm ( $1\frac{1}{2}$  in.) from the conduit when the circuit is operated at 100 Hz or less or 45 mm ( $1\frac{3}{4}$  in.) when the circuit is operated at over 100 Hz.

**(7) Bonding Conductors.** Bonding conductors shall comply with (1) and (2).

- (1) Bonding conductors shall be copper and not smaller than 14 AWG.
- (2) Bonding conductors installed externally of a sign or raceway shall be protected from physical damage.

**(8) Signs in Fountains.** Signs or outline lighting installed inside a fountain shall have all metal parts bonded to the equipment grounding conductor of the branch circuit for the fountain recirculating system. The bonding connection shall be as near as practicable to the fountain and shall be permitted to be made to metal piping systems that are bonded in accordance with 680.53.

Informational Note: Refer to 600.32(J) for restrictions on length of high-voltage secondary conductors.

The requirements of 600.7 cover grounding and bonding of signs and metal equipment of outline lighting. All metal parts larger than 2 in. are required to be bonded. A common practice in the sign industry is to use flexible metal raceways to enclose the conductors supplied from the secondary circuit of a transformer or electronic power supply. In addition to providing protection from physical damage, enclosing the secondary conductors in flexible metal conduit or liquidtight flexible metal conduit is permitted as the bonding means for non-current-carrying metal parts of electric signs. Where

used for bonding in the secondary circuit, the total length of flexible metal conduit in the secondary circuit is not permitted to exceed 100 ft.

Where rigid or flexible nonmetallic conduit is used on secondary wiring of transformers and power supplies, copper bonding conductors must be located external to the nonmetallic raceway. Bonding conductor spacing is required to be at least 1½ in. for circuit frequencies of 100 Hz or less and 1¾ in. for circuit frequencies over 100 Hz. These raceways normally contain only one conductor, which is connected to one side of the neon tube. Where rigid nonmetallic conduit or liquidtight flexible nonmetallic conduit is used and any sign parts are required to be bonded, the bonding conductor(s) must be run outside of and be separated from the nonmetallic conduit. Installing bonding conductors inside the nonmetallic conduit with secondary power-supply conductors is not permitted, because it could increase the chance of failure of the conductor or nonmetallic tubing.

### 600.8 Enclosures

Live parts, other than lamps, and neon tubing shall be enclosed. Transformers and power supplies provided with an integral enclosure, including a primary and secondary circuit splice enclosure, shall not require an additional enclosure.

**(A) Strength.** Enclosures shall have ample structural strength and rigidity.

**(B) Material.** Sign and outline lighting system enclosures shall be constructed of metal or shall be listed.

**(C) Minimum Thickness of Enclosure Metal.** Sheet copper or aluminum shall be at least 0.51 mm (0.020 in.) thick. Sheet steel shall be at least 0.41 mm (0.016 in.) thick.

**(D) Protection of Metal.** Metal parts of equipment shall be protected from corrosion.

### 600.9 Location

**(A) Vehicles.** Sign or outline lighting system equipment shall be at least 4.3 m (14 ft) above areas accessible to vehicles unless protected from physical damage.

**(B) Pedestrians.** Neon tubing, other than dry-location portable signs, readily accessible to pedestrians shall be protected from physical damage.

Informational Note: See 600.41(D) for additional requirements.

**(C) Adjacent to Combustible Materials.** Signs and outline lighting systems shall be installed so that adjacent com-

combustible materials are not subjected to temperatures in excess of 90°C (194°F).

The spacing between wood or other combustible materials and an incandescent or HID lamp or lampholder shall not be less than 50 mm (2 in.).

**(D) Wet Location.** Signs and outline lighting system equipment for wet location use, other than listed watertight type, shall be weatherproof and have drain holes, as necessary, in accordance with the following:

- (1) Drain holes shall not be larger than 13 mm (½ in.) or smaller than 6 mm (¼ in.).
- (2) Every low point or isolated section of the equipment shall have at least one drain hole.
- (3) Drain holes shall be positioned such that there will be no external obstructions.

### 600.10 Portable or Mobile Signs

Portable or mobile electric signs, such as those mounted on trailers, are subject to the requirements of 600.10. These requirements address the safety concerns associated with equipment that is frequently moved and that may be used in damp or wet environments.

**(A) Support.** Portable or mobile signs shall be adequately supported and readily movable without the use of tools.

**(B) Attachment Plug.** An attachment plug shall be provided for each portable or mobile sign.

**(C) Wet or Damp Location.** Portable or mobile signs in wet or damp locations shall comply with 600.10(C)(1) and (C)(2).

**(1) Cords.** All cords shall be junior hard-service or hard-service types as designated in Table 400.4 and have an equipment grounding conductor.

**(2) Ground-Fault Circuit Interrupter.** Portable or mobile signs shall be provided with factory-installed ground-fault circuit-interrupter protection for personnel. The ground-fault circuit interrupter shall be an integral part of the attachment plug or shall be located in the power-supply cord within 300 mm (12 in.) of the attachment plug.

The ground-fault circuit interrupters required for portable electric signs must have integral *open-neutral* protection in accordance with UL 48, *Standard for Electric Signs*. The internal circuitry of a GFCI requires the presence of a 120-volt supply circuit for proper operation. An interruption of the

neutral conductor on the supply side of the GFCI disables the protection circuitry. Open-neutral protection ensures that if damage to the supply cord causes a break in the grounded conductor, both conductors on the load-side circuit to the portable sign will be opened and there will be no voltage present at the sign. These protective devices are required to be original equipment installed by the manufacturer and can be located in-line with the supply cord as shown in Exhibit 600.4, or an attachment plug with an integrated GFCI device can be used.

**EXHIBIT 600.4** A factory-installed GFCI device located in the power-supply cord within 12 in. of the attachment plug.

**(D) Dry Location.** Portable or mobile signs in dry locations shall meet the following:

- (1) Cords shall be SP-2, SPE-2, SPT-2, or heavier, as designated in Table 400.4.
- (2) The cord shall not exceed 4.5 m (15 ft) in length.

### 600.12 Field-Installed Secondary Wiring

Field-installed secondary circuit wiring for electric signs, outline lighting systems, and skeleton tubing systems shall be in accordance with their installation instructions and 600.12(A), (B), or (C).

**(A) 1000 Volts or Less.** Secondary circuit wiring of 1000 volts or less shall comply with 600.31.

**(B) Over 1000 Volts.** Secondary circuit wiring of over 1000 volts shall comply with 600.32.

Depending on the voltage of the secondary circuit, 600.12 requires field-installed secondary circuit wiring of section

signs to be installed in accordance with either 600.31 or 600.32. The two referenced sections are located in Part II of Article 600. In general, the requirements of Part II are intended for application only to field-installed skeleton tubing. However, since 600.31 and 600.32 provide detailed requirements for the safe installation of neon secondary conductors, they are referenced in 600.12 to ensure that the secondary circuits associated with section signs are installed correctly.

**(C) Class 2.** Where the installation complies with 600.33 and the power source provides a Class 2 output that complies with 600.24, either of the following wiring methods shall be permitted as determined by the installation conditions.

Where a power supply with a secondary output meeting the power limitations for Class 2 circuits is listed for use with electric signs and outline lighting or is a component in a listed electric sign, the wiring method can be either one that is covered in Chapter 3 of the *Code* or a listed Class 2 cable installed in accordance with the requirements specific to Class 2 circuits contained in Part III of Article 725.

- (1) Wiring methods identified in Chapter 3
- (2) Class 2 cables complying with Part III of Article 725

### 600.21 Ballasts, Transformers, and Electronic Power Supplies

**(A) Accessibility.** Ballasts, transformers, and electronic power supplies shall be located where accessible and shall be securely fastened in place.

**(B) Location.** Ballasts, transformers, and electronic power supplies shall be installed as near to the lamps or neon tubing as practicable to keep the secondary conductors as short as possible.

**(C) Wet Location.** Ballasts, transformers, and electronic power supplies used in wet locations shall be of the weather-proof type or be of the outdoor type and protected from the weather by placement in a sign body or separate enclosure.

**(D) Working Space.** A working space at least 900 mm (3 ft) high, 900 mm (3 ft) wide, by 900 mm (3 ft) deep shall be provided at each ballast, transformer, and electronic power supply or at its enclosure where not installed in a sign.

**(E) Attic and Soffit Locations.** Ballasts, transformers, and electronic power supplies shall be permitted to be located in attics and soffits, provided there is an access door at least 900 mm by 562.5 mm (36 in. by 22½ in.) and a passageway of at least 900 mm (3 ft) high by 600 mm (2 ft) wide with a

suitable permanent walkway at least 300 mm (12 in.) wide extending from the point of entry to each component. At least one lighting outlet containing a switch or controlled by a wall switch shall be installed in such spaces. At least one point of control shall be at the usual point of entry to these spaces. The lighting outlet shall be provided at or near the equipment requiring servicing.

**(F) Suspended Ceilings.** Ballasts, transformers, and electronic power supplies shall be permitted to be located above suspended ceilings, provided their enclosures are securely fastened in place and not dependent on the suspended ceiling grid for support. Ballasts, transformers, and electronic power supplies installed in suspended ceilings shall not be connected to the branch circuit by flexible cord.

### 600.22 Ballasts

**(A) Type.** Ballasts shall be identified for the use and shall be listed.

**(B) Thermal Protection.** Ballasts shall be thermally protected.

### 600.23 Transformers and Electronic Power Supplies

**(A) Type.** Transformers and electronic power supplies shall be identified for the use and shall be listed.

**(B) Secondary-Circuit Ground-Fault Protection.** Transformers and electronic power supplies other than the following shall have secondary-circuit ground-fault protection:

- (1) Transformers with isolated ungrounded secondaries and with a maximum open circuit voltage of 7500 volts or less
- (2) Transformers with integral porcelain or glass secondary housing for the neon tubing and requiring no field wiring of the secondary circuit

**(C) Voltage.** Secondary-circuit voltage shall not exceed 15,000 volts, nominal, under any load condition. The voltage to ground of any output terminals of the secondary circuit shall not exceed 7500 volts, under any load condition.

**(D) Rating.** Transformers and electronic power supplies shall have a secondary-circuit current rating of not more than 300 mA.

**(E) Secondary Connections.** Secondary circuit outputs shall not be connected in parallel or in series.

**(F) Marking.** Transformers and electronic power supplies that are equipped with secondary-circuit ground-fault protection shall be so marked.

### 600.24 Class 2 Power Sources

Signs and outline lighting systems supplied by Class 2 transformers, power supplies, and power sources shall comply with the requirements of Class 2 circuits and 600.24(A), (B), (C), and (D).

**(A) Listing.** Class 2 power supplies and power sources shall be listed for use with electric signs and outline lighting systems or shall be a component in a listed electric sign.

**(B) Grounding.** Metal parts of signs and outline lighting systems shall be grounded and bonded in accordance with 600.7.

**(C) Wiring Methods on the Supply Side of the Class 2 Power Supply.** Conductors and equipment on the supply side of the power source shall be installed in accordance with the appropriate requirements of Chapter 3.

**(D) Secondary Wiring.** Secondary wiring from Class 2 power sources shall comply with 600.12(C) and 600.33.

## II. Field-Installed Skeleton Tubing, Outline Lighting, and Secondary Wiring

### 600.30 Applicability

Part II of this article shall apply to all of the following:

- (1) Field-installed skeleton tubing
- (2) Field-installed secondary circuits
- (3) Outline lighting

These requirements are in addition to the requirements of Part I.

Field-installed skeleton tubing often involves the use of electrically isolated metal components, such as tube supports, fasteners, or decorative channel over the tubing. Such metallic components should be located so as to minimize the possibility of their becoming energized.

### 600.31 Neon Secondary-Circuit Wiring, 1000 Volts or Less, Nominal

**(A) Wiring Method.** Conductors shall be installed using any wiring method included in Chapter 3 suitable for the conditions.

**(B) Insulation and Size.** Conductors shall be listed, insulated, and not smaller than 18 AWG.

**(C) Number of Conductors in Raceway.** The number of conductors in a raceway shall be in accordance with Table 1 of Chapter 9.

**(D) Installation.** Conductors shall be installed so they are not subject to physical damage.

**(E) Protection of Leads.** Bushings shall be used to protect wires passing through an opening in metal.

### 600.32 Neon Secondary-Circuit Wiring, over 1000 Volts, Nominal

#### (A) Wiring Methods.

**(1) Installation.** Conductors shall be installed in rigid metal conduit, intermediate metal conduit, PVC conduit, RTRC, liquidtight flexible nonmetallic conduit, flexible metal conduit, liquidtight flexible metal conduit, electrical metallic tubing, metal enclosures, on insulators in metal raceways, or other equipment listed for use with neon secondary circuits over 1000 volts.

**(2) Number of Conductors.** Conduit or tubing shall contain only one conductor.

**(3) Size.** Conduit or tubing shall be a minimum of metric designator 16 (trade size ½).

**(4) Spacing from Grounded Parts.** Other than at the location of connection to a metal enclosure or sign body, nonmetallic conduit or flexible nonmetallic conduit shall be spaced no less than 38 mm (1½ in.) from grounded or bonded parts when the conduit contains a conductor operating at 100 Hz or less, and shall be spaced no less than 45 mm (1¾ in.) from grounded or bonded parts when the conduit contains a conductor operating at more than 100 Hz.

Locating GTO cable in close proximity to a grounded surface results in damaging stress to the cable insulation. The requirements in 600.32(A)(4) provide for minimum separation between nonmetallic raceways containing neon secondary circuits and grounded or bonded metal parts.

**(5) Metal Building Parts.** Metal parts of a building shall not be permitted as a secondary return conductor or an equipment grounding conductor.

See the commentary following 600.7.

**(B) Insulation and Size.** Conductors shall be insulated, listed as gas tube sign and ignition cable type GTO, rated for 5, 10, or 15 kV, not smaller than 18 AWG, and have a minimum temperature rating of 105°C (221°F).

Section 600.32(B) requires the use of cable specifically listed as gas tube sign and ignition cable, Type GTO, rated at

5, 10, or 15 kV. Informative Annex A identifies the product standard for this cable as UL 814, *Gas-Tube-Sign Cable*.

**(C) Installation.** Conductors shall be so installed that they are not subject to physical damage.

**(D) Bends in Conductors.** Sharp bends in insulated conductors shall be avoided.

**(E) Spacing.** Secondary conductors shall be separated from each other and from all objects other than insulators or neon tubing by a spacing of not less than 38 mm (1½ in.). GTO cable installed in metal conduit or tubing requires no spacing between the cable insulation and the conduit or tubing.

**(F) Insulators and Bushings.** Insulators and bushings for conductors shall be listed for use with neon secondary circuits over 1000 volts.

**(G) Conductors in Raceways.** The insulation on all conductors shall extend not less than 65 mm (2½ in.) beyond the metal conduit or tubing.

**(H) Between Neon Tubing and Midpoint Return.** Conductors shall be permitted to run between the ends of neon tubing or to the secondary circuit midpoint return of listed transformers or listed electronic power supplies and provided with terminals or leads at the midpoint.

**(I) Dwelling Occupancies.** Equipment having an open circuit voltage exceeding 1000 volts shall not be installed in or on dwelling occupancies.

#### (J) Length of Secondary Circuit Conductors.

**(1) Secondary Conductor to the First Electrode.** The length of secondary circuit conductors from a high-voltage terminal or lead of a transformer or electronic power supply to the first neon tube electrode shall not exceed the following:

- (1) 6 m (20 ft) where installed in metal conduit or tubing
- (2) 15 m (50 ft) where installed in nonmetallic conduit

**(2) Other Secondary Circuit Conductors.** All other sections of secondary circuit conductor in a neon tube circuit shall be as short as practicable.

**(K) Splices.** Splices in high-voltage secondary circuit conductors shall be made in listed enclosures rated over 1000 volts. Splice enclosures shall be accessible after installation and listed for the location where they are installed.

### 600.33 LED Sign Illumination Systems, Secondary Wiring

The wiring methods and materials shall be installed in accordance with the sign manufacturer's installation instructions using any applicable wiring methods from Chapter 3 and the requirements for Class 2 circuits contained in Part III of Article 725.

**(A) Insulation and Sizing of Class 2 Conductors.** Listed Class 2 cable that complies with Table 725.154(G) shall be installed on the load side of the Class 2 power source. The conductors shall have an ampacity not less than the load to be supplied and shall not be sized smaller than 22 AWG.

**(1) Wet Locations.** Class 2 cable used in a wet location shall be identified for use in wet locations or have a moisture-impervious metal sheath.

Where installed in a wet location, the wiring method for circuits supplied by a Class 2 power supply listed for use with electric signs and outline lighting systems is permitted to be either a Class 2 cable identified for use in wet locations, a Class 2 cable with a moisture-impervious metal sheath, or a wiring method from Chapter 3 that is suitable for installation in a wet location in accordance with the first paragraph of 600.33.

**(2) Other Locations.** In other locations, any applicable cable permitted in Table 725.154(G) shall be permitted to be used.

**(B) Installation.** Secondary wiring shall be installed in accordance with (B)(1) and (B)(2).

- (1) Support wiring shall be installed in a neat and workmanlike manner. Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable is not be damaged by normal building use. Such cables shall be supported by straps, staples, hangers, cable ties, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4(D).
- (2) Connections in cable and conductors shall be made with listed insulating devices and be accessible after installation. Where made in a wall, connections shall be enclosed in a listed box.

**(C) Protection Against Physical Damage.** Where subject to physical damage, the conductors shall be protected and installed in accordance with 300.4.

**(D) Grounding and Bonding.** Grounding and bonding shall be in accordance with 600.7.

Signs and outline lighting systems that employ an LED illumination system are required to be grounded and bonded as specified in 600.7. Parts of a section sign or outline lighting system that are supplied by the secondary circuit of a listed sign or outline lighting power supply with a Class 2 circuit output, and that are located remote from the power supply, are not required to be bonded in accordance with 600.7(B)(1), Exception.

### 600.41 Neon Tubing

**(A) Design.** The length and design of the tubing shall not cause a continuous overcurrent beyond the design loading of the transformer or electronic power supply.

**(B) Support.** Tubing shall be supported by listed tube supports. The neon tubing shall be supported within 150 mm (6 in.) from the electrode connection.

**(C) Spacing.** A spacing of not less than 6 mm (¼ in.) shall be maintained between the tubing and the nearest surface, other than its support.

A tube that is too long or too small in diameter increases the impedance of the load and thus stresses the transformer insulation. Gas tube sign transformers are designed to operate at or near short-circuit current. Generally, the primary voltage of the transformers is 120 volts, and proper installation and maintenance of transformers and high-voltage secondary conductors minimize the possibility of injury or fire. Precautions should be taken to ensure that secondary conductors are properly terminated to the tube electrodes and that the connections are protected from contact by unauthorized persons or contact with any flammable or combustible material. Broken tubes should be replaced or de-energized.

**(D) Protection.** Field-installed skeleton tubing shall not be subject to physical damage. Where the tubing is readily accessible to other than qualified persons, field-installed skeleton tubing shall be provided with suitable guards or protected by other approved means.

### 600.42 Electrode Connections

**(A) Points of Transition.** Where the high-voltage secondary circuit conductors emerge from the wiring methods specified in 600.32(A), they shall be enclosed in a listed assembly.

**(B) Accessibility.** Terminals of the electrode shall not be accessible to unqualified persons.

**(C) Electrode Connections.** Connections shall be made by use of a connection device, twisting of the wires together, or use of an electrode receptacle. Connections shall be electrically and mechanically secure and shall be in an enclosure listed for the purpose.

**(D) Support.** Neon secondary conductor(s) shall be supported not more than 150 mm (6 in.) from the electrode connection to the tubing.

**(E) Receptacles.** Electrode receptacles shall be listed.

**(F) Bushings.** Where electrodes penetrate an enclosure, bushings listed for the purpose shall be used unless receptacles are provided.

**(G) Wet Locations.** A listed cap shall be used to close the opening between neon tubing and a receptacle where the receptacle penetrates a building. Where a bushing or neon tubing penetrates a building, the opening between neon tubing and the bushing shall be sealed.

**(H) Electrode Enclosures.** Electrode enclosures shall be listed.

**(1) Dry Locations.** Electrode enclosures that are listed for use in dry, damp, or wet locations shall be permitted to be installed and used in such locations.

**(2) Damp and Wet Locations.** Electrode enclosures installed in damp and wet locations shall be specifically listed and identified for use in such locations.

Informational Note: See 110.3(B) covering installation and use of electrical equipment.

## ARTICLE 604

### Manufactured Wiring Systems

#### Contents

- 604.1 Scope
- 604.2 Definition
- 604.4 Uses Permitted
- 604.5 Uses Not Permitted
- 604.6 Construction
  - (A) Cable or Conduit Types
  - (B) Marking
  - (C) Receptacles and Connectors
  - (D) Other Component Parts
- 604.7 Installation

#### 604.1 Scope

The provisions of this article apply to field-installed wiring using off-site manufactured subassemblies for branch cir-

cuits, remote-control circuits, signaling circuits, and communications circuits in accessible areas.

#### 604.2 Definition

**Manufactured Wiring System.** A system containing component parts that are assembled in the process of manufacture and cannot be inspected at the building site without damage or destruction to the assembly and used for the connection of luminaires, utilization equipment, continuous plug-in type busways, and other devices.

#### 604.4 Uses Permitted

Manufactured wiring systems shall be permitted in accessible and dry locations and in ducts, plenums, and other air-handling spaces where listed for this application and installed in accordance with 300.22.

Article 604 covers manufactured wiring systems that are typically constructed of armored cable, Type AC, or metal clad cable, Type MC, and that are provided with factory connectors and receptacles. The connection devices used with these systems facilitate ease of initial installation and future relocation of equipment such as luminaires. These systems are used extensively for the installation of branch-circuit and tap conductors supplying luminaires in accessible locations, including open and suspended-ceiling construction. Manufactured wiring systems employing flexible conduits, flexible cords, busways, and surface-mounted raceways are also permitted by this article. For further information, see Article 100 for the definition of *accessible (as applied to wiring methods)*.

*Exception No. 1: In concealed spaces, one end of tapped cable shall be permitted to extend into hollow walls for direct termination at switch and outlet points.*

*Exception No. 2: Manufactured wiring system assemblies installed outdoors shall be listed for use in outdoor locations.*

The marking “Outdoor” on a listed manufactured wiring system assembly indicates it has been evaluated and is suitable for use in an outdoor wet or damp location.

#### 604.5 Uses Not Permitted

Manufactured wiring system types shall not be permitted where limited by the applicable article in Chapter 3 for the wiring method used in its construction.

#### 604.6 Construction

##### (A) Cable or Conduit Types.

**(1) Cables.** Cable shall be one of the following:

- (1) Listed Type AC cable containing nominal 600-volt, 8 to 12 AWG insulated copper conductors with a bare or in-

ulated copper equipment grounding conductor equivalent in size to the ungrounded conductor.

- (2) Listed Type MC cable containing nominal 600-volt, 8 to 12 AWG insulated copper conductors with a bare or insulated copper equipment grounding conductor equivalent in size to the ungrounded conductor.
- (3) Listed Type MC cable containing nominal 600-volt, 8 to 12 AWG insulated copper conductors with a grounding conductor and armor assembly listed and identified for grounding in accordance with 250.118(10). The combined metallic sheath and grounding conductor shall have a current-carrying capacity equivalent to that of the ungrounded copper conductor.

The requirements of 604.6(A)(1)(1) through (A)(1)(3) permit 8 AWG copper circuit conductors to be installed in AC and MC cable-type manufactured wiring systems. The 8 AWG maximum conductor size permitted is specifically aimed at improving the ability of the manufactured wiring system to overcome voltage drop in branch circuits. Section 604.6(A)(2) provides the same maximum size conductor requirement for manufactured wiring systems comprised of flexible metal and liquidtight flexible metal conduits.

Other cables as listed in 725.154, 800.113, 820.113, and 830.179 shall be permitted in manufactured wiring systems for wiring of equipment within the scope of their respective articles.

**(2) Conduits.** Conduit shall be listed flexible metal conduit or listed liquidtight flexible conduit containing nominal 600-volt, 8 to 12 AWG insulated copper conductors with a bare or insulated copper equipment grounding conductor equivalent in size to the ungrounded conductor.

*Exception No. 1 to (1) and (2): A luminaire tap, no longer than 1.8 m (6 ft) and intended for connection to a single luminaire, shall be permitted to contain conductors smaller than 12 AWG but not smaller than 18 AWG.*

*Exception No. 2 to (1) and (2): Listed manufactured wiring assemblies containing conductors smaller than 12 AWG shall be permitted for remote-control, signaling, or communication circuits.*

*Exception No. 3 to (2): Listed manufactured wiring systems containing unlisted flexible metal conduit of noncircular cross section or trade sizes smaller than permitted by 348.20(A), or both, provided the wiring systems are supplied with fittings and conductors at the time of manufacture.*

**(3) Flexible Cord.** Flexible cord suitable for hard usage, with minimum 12 AWG conductors, shall be permitted as

part of a listed factory-made assembly not exceeding 1.8 m (6 ft) in length when making a transition between components of a manufactured wiring system and utilization equipment not permanently secured to the building structure. The cord shall be visible for the entire length, shall not be subject to physical damage, and shall be provided with identified strain relief.

Section 604.6(A)(3) facilitates a transition between manufactured wiring systems and utilization equipment found in display cases, merchandise racks, temporary work stations, and the like. This transition is limited, however, to hard-usage cord not over 6 ft in length, to minimize damage, as illustrated in Exhibit 604.1. Examples of polarized receptacles and connectors are shown in Exhibit 604.2.

**EXHIBIT 604.1** Transition wiring between a manufactured wiring system and utilization equipment.

*Exception: Listed electric-discharge luminaires that comply with 410.62(C) shall be permitted with conductors smaller than 12 AWG.*

The exception to 604.6(A)(3) and the requirements in 410.62(C)(1) permit the use of flexible cord equipped with a manufactured wiring system connector as a means to supply listed electric-discharge luminaires such as fluorescent or

**EXHIBIT 604.2** Polarized receptacles and connectors of a manufactured wiring system. (Courtesy of RELOC® Wiring Solutions, an Acuity Brands Company)

high-intensity discharge types. In this application, the cord-equipped luminaires are supplied from branch-circuit conductors installed using a manufactured wiring system. This method of supplying electric-discharge luminaires is permitted only where the cord is visible for its entire length, from its attachment to the luminaire to its interface with the branch-circuit conductors of the manufactured wiring system. Where used for connection of listed electric-discharge luminaires, listed manufactured wiring system cord assemblies not longer than 6 ft and containing conductors smaller than 12 AWG copper are permitted.

**(4) Busways.** Busways shall be listed continuous plug-in type containing factory-mounted, bare or insulated conductors, which shall be copper or aluminum bars, rods, or tubes. The busway shall be provided with an equipment ground. The busway shall be rated nominal 600 volts, 20, 30, or 40 amperes. Busways shall be installed in accordance with 368.12, 368.17(D), and 368.30.

**(5) Raceway.** Prewired, modular, surface-mounted raceways shall be listed for the use, rated nominal 600 volts, 20 amperes, and installed in accordance with 386.12, 386.30, 386.60, and 386.100.

This section permits metal and nonmetallic surface-mounted raceways to be prewired as a modular component of a manufactured wiring system. This assembly is required to be listed specifically for the application. ANSI/UL 183, *Manufactured Wiring Systems*, covers the construction of these systems. Article 380, Multioutlet Assemblies, contains the requirements for the installation of surface, flush, or free-standing raceways that contain conductors and receptacles. Although multioutlet assemblies are permitted to be assembled in the field, the majority of the product in today's marketplace is assembled by the product manufacturer. Listed

multioutlet assemblies are covered by ANSI/UL 5, *Surface Metal Raceways and Fittings*, and ANSI UL 5A, *Nonmetallic Surface Raceways and Fittings*.

**(B) Marking.** Each section shall be marked to identify the type of cable, flexible cord, or conduit.

**(C) Receptacles and Connectors.** Receptacles and connectors shall be of the locking type, uniquely polarized and identified for the purpose, and shall be part of a listed assembly for the appropriate system. All connector openings shall be designed to prevent inadvertent contact with live parts or capped to effectively close the connector openings.

**(D) Other Component Parts.** Other component parts shall be listed for the appropriate system.

### 604.7 Installation

Manufactured wiring systems shall be secured and supported in accordance with the applicable cable or conduit article for the cable or conduit type employed.

Manufactured wiring systems are permitted to be constructed using the wiring methods described in 604.6(A). The installation requirements for these wiring methods are contained in Chapter 3. The securing and supporting requirements for manufactured wiring systems are taken from the Chapter 3 article that covers the wiring method employed in construction of the system.

## ARTICLE 605 Office Furnishings (Consisting of Lighting Accessories and Wired Partitions)

- 605.6 Fixed-Type Partitions
- 605.7 Freestanding-Type Partitions

### 605.8 Freestanding-Type Partitions, Cord-and-Plug-Connected

- (A) Flexible Power-Supply Cord
- (B) Receptacle Supplying Power
- (C) Receptacle Outlets, Maximum
- (D) Multiwire Circuits, Not Permitted

### 605.1 Scope

This article covers electrical equipment, lighting accessories, and wiring systems used to connect, or contained within, or installed on relocatable wired partitions.

This article covers electrical equipment and conductors installed in partitions that are freestanding or fixed, but are not as permanent as a conventional stud-and-wallboard type of partition. The electrical equipment and devices shown in Exhibit 605.1 are components of a modular office furnishing system.

**EXHIBIT 605.1** Example of a fixed-type office partition where the supply branch circuit(s) can be connected to the partition wiring either through the top or bottom of the partition.

### 605.2 General

Wiring systems shall be identified as suitable for providing power for lighting accessories and appliances in wired partitions. These partitions shall not extend from floor to ceiling.

*Exception: Where permitted by the authority having jurisdiction, these relocatable wired partitions shall be permitted to extend to, but shall not penetrate, the ceiling.*

**(A) Use.** These assemblies shall be installed and used only as provided for by this article.

**(B) Hazardous (Classified) Locations.** Where used in hazardous (classified) locations, these assemblies shall comply with Articles 500 through 517 in addition to this article.

### 605.3 Wireways

All conductors and connections shall be contained within wiring channels of metal or other material identified as suitable for the conditions of use. Wiring channels shall be free of projections or other conditions that may damage conductor insulation.

A wiring channel that is separate from the channel containing the branch circuits for light and power may be provided within the system components for the routing of communications, signaling, and fiber optic cables.

### 605.4 Partition Interconnections

The electrical connection between partitions shall be a flexible assembly identified for use with wired partitions or shall be permitted to be installed using flexible cord, provided all the following conditions are met:

- (1) The cord is extra-hard usage type with 12 AWG or larger conductors, with an insulated equipment grounding conductor.
- (2) The partitions are mechanically contiguous.
- (3) The cord is not longer than necessary for maximum positioning of the partitions but is in no case to exceed 600 mm (2 ft).
- (4) The cord is terminated at an attachment plug-and-cord connector with strain relief.

### 605.5 Lighting Accessories

Lighting equipment shall be listed and identified for use with wired partitions and shall comply with 605.5(A), (B), and (C).

**(A) Support.** A means for secure attachment or support shall be provided.

**(B) Connection.** Where cord-and-plug connection is provided, the cord length shall be suitable for the intended application but shall not exceed 2.7 m (9 ft) in length. The cord shall not be smaller than 18 AWG, shall contain an equipment grounding conductor, and shall be of the hard usage type. Connection by other means shall be identified as suitable for the condition of use.

**(C) Receptacle Outlet.** Receptacles shall not be permitted in lighting accessories.

### 605.6 Fixed-Type Partitions

Wired partitions that are fixed (secured to building surfaces) shall be permanently connected to the building electrical system by one of the wiring methods of Chapter 3.

### 605.7 Freestanding-Type Partitions

Partitions of the freestanding type (not fixed) shall be permitted to be connected to the building electrical system by one of the wiring methods of Chapter 3.

Intended to enhance the safety of those servicing permanently connected office partitions, 605.7 specifies simultaneous disconnection of all ungrounded conductors of multiwire branch circuits supplying fixed and freestanding-type office partitions. This provision pre-dated the general rule now specified in 210.4(B) requiring simultaneous disconnection of the ungrounded conductors of multiwire branch circuits. (See the definition of *branch circuit*, *multiwire* in Article 100.) This section does not require simultaneous disconnecting of partitions supplied by multiple branch circuits as in the case of a partition supplied by two branch circuits originating from different sources. It is not uncommon for an office partition to contain receptacles supplied by a normal power branch circuit and a branch circuit powered from an uninterruptible power supply. Either or both of these branch circuits may be multiwire branch circuits and, if so, must individually comply with the simultaneous disconnecting means requirement. Each of the multiple branch circuits is treated individually for the purposes of applying this requirement.

### 605.8 Freestanding-Type Partitions, Cord-and-Plug-Connected

Individual partitions of the freestanding type, or groups of individual partitions that are electrically connected, are mechanically contiguous, and do not exceed 9.0 m (30 ft) when assembled, shall be permitted to be connected to the building electrical system by a single flexible cord and plug, provided all of the conditions of 605.8(A) through (D) are met.

**(A) Flexible Power-Supply Cord.** The flexible power-supply cord shall be extra-hard usage type with 12 AWG or

larger conductors with an insulated equipment grounding conductor and shall not exceed 600 mm (2 ft) in length.

**(B) Receptacle Supplying Power.** The receptacle(s) supplying power shall be on a separate circuit serving only panels and no other loads and shall be located not more than 300 mm (12 in.) from the partition that is connected to it.

**(C) Receptacle Outlets, Maximum.** Individual partitions or groups of interconnected individual partitions shall not contain more than thirteen 15-ampere, 125-volt receptacle outlets.

**(D) Multiwire Circuits, Not Permitted.** Individual partitions or groups of interconnected individual partitions shall not contain multiwire circuits.

Informational Note: See 210.4 for circuits supplying partitions in 605.6 and 605.7.

Cord-and-plug-connected freestanding-type office partitions are not permitted to contain multiwire branch circuits.

## I. General

### 610.1 Scope

This article covers the installation of electrical equipment and wiring used in connection with cranes, monorail hoists, hoists, and all runways.

**Informational Note:** For further information, see ANSI B30, *Safety Code for Cranes, Derricks, Hoists, Jacks, and Slings*.

Electric cranes, such as the ones shown in Exhibit 610.1, present unique challenges to ensuring that electrical safety is maintained. Constant movement of the crane requires flexibility of power and control wiring or the use of contact conductors installed along the crane runway or bridge. The duty cycle of crane motors is addressed in Table 610.14(A) covering conductor ampacities for short-time rated crane and hoist motors.

### 610.2 Definition

**Festoon Cable.** Single- and multiple-conductor cable intended for use and installation in accordance with Article 610 where flexibility is required.

**Informational Note:** Festoon cable consists of one or more insulated conductors cabled together with an overall jacket. It is rated 60°C (140°F), 75°C (167°F), 90°C (194°F), or 105°C (221°F) and 600 V.

### 610.3 Special Requirements for Particular Locations

**(A) Hazardous (Classified) Locations.** All equipment that operates in a hazardous (classified) location shall conform to Article 500.

**(1) Class I Locations.** Equipment used in locations that are hazardous because of the presence of flammable gases or vapors shall conform to Article 501.

**(2) Class II Locations.** Equipment used in locations that are hazardous because of combustible dust shall conform to Article 502.

**(3) Class III Locations.** Equipment used in locations that are hazardous because of the presence of easily ignitable fibers or flyings shall conform to Article 503.

For more details on equipment in Class III locations, see the commentary following 503.155(D).

**(B) Combustible Materials.** Where a crane, hoist, or monorail hoist operates over readily combustible

**EXHIBIT 610.1** New CRJ1000 NextGen aircraft fuselage being hoisted for joining at Bombardier Aerospace's Mirabel Manufacturing Plant. (Courtesy of Bombardier Aerospace)

material, the resistors shall be located as permitted in the following:

- (1) A well ventilated cabinet composed of noncombustible material constructed so that it does not emit flames or molten metal
- (2) A cage or cab constructed of noncombustible material that encloses the sides of the cage or cab from the floor to a point at least 150 mm (6 in.) above the top of the resistors

(C) **Electrolytic Cell Lines.** See 668.32.

Special precautions are necessary on electrolytic cell lines to prevent the introduction of exposed grounded parts, as described in 668.32.

## II. Wiring

### 610.11 Wiring Method

Conductors shall be enclosed in raceways or be Type AC cable with insulated grounding conductor, Type MC cable, or Type MI cable unless otherwise permitted or required in 610.11(A) through (E).

Type AC cable with an insulated grounding conductor is permitted as an acceptable wiring method for cranes and hoists.

The insulated wire-type equipment grounding conductor, terminated on the grounding terminals of crane- and hoist-associated equipment, is required to ensure the continuity of the grounding and bonding connection to equipment that is frequently subject to vibration.

(A) **Contact Conductor.** Contact conductors shall not be required to be enclosed in raceways.

(B) **Exposed Conductors.** Short lengths of exposed conductors at resistors, collectors, and other equipment shall not be required to be enclosed in raceways.

(C) **Flexible Connections to Motors and Similar Equipment.** Where flexible connections are necessary, flexible stranded conductors shall be used. Conductors shall be in flexible metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit, multiconductor cable, or an approved nonmetallic flexible raceway.

The use of short lengths of open wiring on cranes and hoists is permitted by 610.11(B). Short runs of open conductors facilitate connection to resistors, collectors, and similar equipment. Each conductor is required to be provided with separately bushed holes in boxes, as well as in cable and raceway fittings used where the transition to open wiring is

made. In addition to other types of raceways and cables, 610.11(C) permits flexible metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit, multiconductor cable, or an approved nonmetallic enclosure (tubing) where flexibility is necessary.

**(D) Pushbutton Station Multiconductor Cable.** Where multiconductor cable is used with a suspended pushbutton station, the station shall be supported in some satisfactory manner that protects the electrical conductors against strain.

Exhibit 610.2 shows an example of suitable strain relief for a cord that supports a control pushbutton station for an overhead crane.

**EXHIBIT 610.2** A suitable strain relief grip for a cord-suspended pushbutton station.

**(E) Flexibility to Moving Parts.** Where flexibility is required for power or control to moving parts, listed festoon cable or a cord suitable for the purpose shall be permitted, provided the following apply:

- (1) Suitable strain relief and protection from physical damage is provided.

- (2) In Class I, Division 2 locations, the cord is approved for extra-hard usage.

### 610.12 Raceway or Cable Terminal Fittings

Conductors leaving raceways or cables shall comply with either 610.12(A) or (B).

**(A) Separately Bushed Hole.** A box or terminal fitting that has a separately bushed hole for each conductor shall be used wherever a change is made from a raceway or cable to exposed wiring. A fitting used for this purpose shall not contain taps or splices and shall not be used at luminaire outlets.

**(B) Bushing in Lieu of a Box.** A bushing shall be permitted to be used in lieu of a box at the end of a rigid metal conduit, intermediate metal conduit, or electrical metallic tubing where the raceway terminates at unenclosed controls or similar equipment, including contact conductors, collectors, resistors, brakes, power-circuit limit switches, and dc split-frame motors.

### 610.13 Types of Conductors

Conductors shall comply with Table 310.104(A) unless otherwise permitted in 610.13(A) through (D).

**(A) Exposed to External Heat or Connected to Resistors.** A conductor(s) exposed to external heat or connected to resistors shall have a flame-resistant outer covering or be covered with flame-resistant tape individually or as a group.

**(B) Contact Conductors.** Contact conductors along runways, crane bridges, and monorails shall be permitted to be bare and shall be copper, aluminum, steel, or other alloys or combinations thereof in the form of hard-drawn wire, tees, angles, tee rails, or other stiff shapes.

**(C) Flexibility.** Where flexibility is required, listed flexible cord or cable, or listed festoon cable, shall be permitted to be used and, where necessary, cable reels or take-up devices shall be used.

**(D) Class 1, Class 2, and Class 3 Circuits.** Conductors for Class 1, Class 2, and Class 3 remote-control, signaling, and power-limited circuits, installed in accordance with Article 725, shall be permitted.

Section 610.13(D) references Article 725 for Class 1, Class 2, and Class 3 control circuit conductors. This cross-reference is necessary because 90.3 does not allow Article 725 to modify Article 610. The change allows the methods of wiring control and signaling circuits permitted in Article 725 to be used for crane- and hoist-control circuits.

### 610.14 Rating and Size of Conductors

**(A) Ampacity.** The allowable ampacities of conductors shall be as shown in Table 610.14(A).

Informational Note: For the ampacities of conductors between controllers and resistors, see 430.23.

**(B) Secondary Resistor Conductors.** Where the secondary resistor is separate from the controller, the minimum size of the conductors between controller and resistor shall be calculated by multiplying the motor secondary current by the appropriate factor from Table 610.14(B) and selecting a wire from Table 610.14(A).

**(C) Minimum Size.** Conductors external to motors and controls shall be not smaller than 16 AWG unless otherwise permitted in (1) or (2):

- (1) 18 AWG wire in multiconductor cord shall be permitted for control circuits not exceeding 7 amperes.
- (2) Wires not smaller than 20 AWG shall be permitted for electronic circuits.

**(D) Contact Conductors.** Contact wires shall have an ampacity not less than that required by Table 610.14(A) for 75°C (167°F) wire, and in no case shall they be smaller than as shown in Table 610.14(D).

#### (E) Calculation of Motor Load.

**(1) Single Motor.** For one motor, 100 percent of motor nameplate full-load ampere rating shall be used.

**(2) Multiple Motors on Single Crane or Hoist.** For multiple motors on a single crane or hoist, the minimum ampac-

91–100	—	—	—	—	0.51	0.51	195–212
101–120	—	—	—	—	0.40	0.40	213–248

Note: Other insulations shown in Table 310.13(A) and approved for the temperature and location shall be permitted to be substituted for those shown in Table 610.14(A). The allowable ampacities of conductors used with 15-minute motors shall be the 30-minute ratings increased by 12 percent.

<sup>1</sup> For 5 to 8 simultaneously energized power conductors in raceway or cable, the ampacity of each power conductor shall be reduced to a value of 80 percent of that shown in this table.

<sup>2</sup> For 4 to 6 simultaneously energized 125°C (257°F) ac power conductors in raceway or cable, the ampacity of each power conductor shall be reduced to a value of 80 percent of that shown in this table.

TABLE 610.14(B) Secondary Conductor Rating Factors

Time in Seconds		Ampacity of Wire in Percent of Full-Load Secondary Current
On	Off	
5	75	35

15	75	55
15	45	65
15	30	75
15	15	85
Continuous Duty		110

ity of the power supply conductors shall be the nameplate full-load ampere rating of the largest motor or group of motors for any single crane motion, plus 50 percent of the nameplate full-load ampere rating of the next largest motor or group of motors, using that column of Table 610.14(A) that applies to the longest time-rated motor.

**(3) Multiple Cranes or Hoists on a Common Conductor System.** For multiple cranes, hoists, or both, supplied by a common conductor system, calculate the motor minimum ampacity for each crane as defined in 610.14(E), add them together, and multiply the sum by the appropriate demand factor from Table 610.14(E).

TABLE 610.14(D) Minimum Contact Conductor Size Based on Distance Between Supports

Minimum Size of Wire (AWG)	Maximum Distance Between End Strain Insulators or Clamp-Type Intermediate Supports
6	9.0 m (30 ft) or less
4	18 m (60 ft) or less
2	Over 18 m (60 ft)

4	0.87
5	0.84
6	0.81
7	0.78

**(F) Other Loads.** Additional loads, such as heating, lighting, and air conditioning, shall be provided for by application of the appropriate sections of this *Code*.

**(G) Nameplate.** Each crane, monorail, or hoist shall be provided with a visible nameplate marked with the manufacturer's name, rating in volts, frequency, number of phases, and circuit amperes as calculated in 610.14(E) and (F).

### 610.15 Common Return

Where a crane or hoist is operated by more than one motor, a common-return conductor of proper ampacity shall be permitted.

## III. Contact Conductors

### 610.21 Installation of Contact Conductors

Contact conductors shall comply with 610.21(A) through (H).

**(A) Locating or Guarding Contact Conductors.** Runway contact conductors shall be guarded, and bridge contact conductors shall be located or guarded in such a manner that persons cannot inadvertently touch energized current-carrying parts.

**(B) Contact Wires.** Wires that are used as contact conductors shall be secured at the ends by means of approved strain insulators and shall be mounted on approved insulators so that the extreme limit of displacement of the wire does not bring the latter within less than 38 mm (1½ in.) from the surface wired over.

**(C) Supports Along Runways.** Main contact conductors carried along runways shall be supported on insulating supports placed at intervals not exceeding 6.0 m (20 ft) unless otherwise permitted in 610.21(F).

Such conductors shall be separated at not less than 150 mm (6 in.), other than for monorail hoists where a spacing of not less than 75 mm (3 in.) shall be permitted. Where necessary, intervals between insulating supports shall be permitted to be increased up to 12 m (40 ft), the separation between conductors being increased proportionately.

**(D) Supports on Bridges.** Bridge wire contact conductors shall be kept at least 65 mm (2½ in.) apart, and, where the span exceeds 25 m (80 ft), insulating saddles shall be placed at intervals not exceeding 15 m (50 ft).

**(E) Supports for Rigid Conductors.** Conductors along runways and crane bridges, that are of the rigid type specified in 610.13(B) and not contained within an approved enclosed assembly, shall be carried on insulating supports spaced at intervals of not more than 80 times the vertical di-

mension of the conductor, but in no case greater than 4.5 m (15 ft), and spaced apart sufficiently to give a clear electrical separation of conductors or adjacent collectors of not less than 25 mm (1 in.).

**(F) Track as Circuit Conductor.** Monorail, tram rail, or crane runway tracks shall be permitted as a conductor of current for one phase of a 3-phase, ac system furnishing power to the carrier, crane, or trolley, provided all of the following conditions are met:

- (1) The conductors supplying the other two phases of the power supply are insulated.
- (2) The power for all phases is obtained from an insulating transformer.
- (3) The voltage does not exceed 300 volts.
- (4) The rail serving as a conductor shall be bonded to the equipment grounding conductor at the transformer and also shall be permitted to be grounded by the fittings used for the suspension or attachment of the rail to a building or structure.

Crane runway tracks are permitted as a current-carrying conductor where part of a 3-phase system that is furnishing power to the crane. The track is also permitted to be grounded through the metal supporting means attached to the metal frame of a building.

**(G) Electrical Continuity of Contact Conductors.** All sections of contact conductors shall be mechanically joined to provide a continuous electrical connection.

**(H) Not to Supply Other Equipment.** Contact conductors shall not be used as feeders for any equipment other than the crane(s) or hoist(s) that they are primarily designed to serve.

### 610.22 Collectors

Collectors shall be designed so as to reduce to a minimum sparking between them and the contact conductor; and, where operated in rooms used for the storage of easily ignitable combustible fibers and materials, they shall comply with 503.155.

## IV. Disconnecting Means

### 610.31 Runway Conductor Disconnecting Means

A disconnecting means that has a continuous ampere rating not less than that calculated in 610.14(E) and (F) shall be provided between the runway contact conductors and the power supply. Such disconnecting means shall consist of a motor-circuit switch, circuit breaker, or molded-case switch. This disconnecting means shall be as follows:

- (1) Readily accessible and operable from the ground or floor level.
- (2) Capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted as the means required to be installed at and remain with the equipment.
- (3) Open all ungrounded conductors simultaneously.
- (4) Placed within view of the runway contact conductors.

### 610.32 Disconnecting Means for Cranes and Monorail Hoists

A motor-circuit switch, molded-case switch, or circuit breaker shall be provided in the leads from the runway contact conductors or other power supply on all cranes and monorail hoists. The disconnecting means shall be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.

Where a monorail hoist or hand-propelled crane bridge installation meets all of the following, the disconnecting means shall be permitted to be omitted:

- (1) The unit is controlled from the ground or floor level.
- (2) The unit is within view of the power supply disconnecting means.
- (3) No fixed work platform has been provided for servicing the unit.

Where the disconnecting means is not readily accessible from the crane or monorail hoist operating station, means shall be provided at the operating station to open the power circuit to all motors of the crane or monorail hoist.

Many crane installations are not arranged so that the unit is within view of the power-supply disconnecting means. Therefore, a disconnecting means (lock-open type) must be provided in the contact conductors, and the means to lock the disconnecting means in the open position must be an accessory that is identified for this use and has to be in place on the disconnecting means at all times. The portable type lock-out mechanisms cannot be used to comply with this requirement. The chance that the portable-type device could easily be removed from the disconnecting means location compromises the safety benefit of having a disconnecting means that is at all times equipped to be locked off or open.

When one crane is being serviced, another unit on the same system could remain energized and be run into the person performing maintenance on the locked-out unit.

### 610.33 Rating of Disconnecting Means

The continuous ampere rating of the switch or circuit breaker required by 610.32 shall not be less than 50 percent of the combined short-time ampere rating of the motors or less than 75 percent of the sum of the short-time ampere rating of the motors required for any single motion.

## V. Overcurrent Protection

### 610.41 Feeders, Runway Conductors

**(A) Single Feeder.** The runway supply conductors and main contact conductors of a crane or monorail shall be protected by an overcurrent device(s) that shall not be greater than the largest rating or setting of any branch-circuit protective device plus the sum of the nameplate ratings of all the other loads with application of the demand factors from Table 610.14(E).

**(B) More Than One Feeder Circuit.** Where more than one feeder circuit is installed to supply runway conductors, each feeder circuit shall be sized and protected in compliance with 610.41(A).

Multiple feeders are sometimes used to supply long runway conductors to minimize voltage drops on the runway conductors.

### 610.42 Branch-Circuit Short-Circuit and Ground-Fault Protection

Branch circuits shall be protected in accordance with 610.42(A). Branch-circuit taps, where made, shall comply with 610.42(B).

**(A) Fuse or Circuit Breaker Rating.** Crane, hoist, and monorail hoist motor branch circuits shall be protected by fuses or inverse-time circuit breakers that have a rating in accordance with Table 430.52. Where two or more motors operate a single motion, the sum of their nameplate current ratings shall be considered as that of a single motor.

#### **(B) Taps.**

**(1) Multiple Motors.** Where two or more motors are connected to the same branch circuit, each tap conductor to an individual motor shall have an ampacity not less than one-third that of the branch circuit. Each motor shall be protected from overload according to 610.43.

(2) **Control Circuits.** Where taps to control circuits originate on the load side of a branch-circuit protective device, each tap and piece of equipment shall be protected in accordance with 430.72.

(3) **Brake Coils.** Taps without separate overcurrent protection shall be permitted to brake coils.

### 610.43 Overload Protection

(A) **Motor and Branch-Circuit Overload Protection.** Each motor, motor controller, and branch-circuit conductor shall be protected from overload by one of the following means:

- (1) A single motor shall be considered as protected where the branch-circuit overcurrent device meets the rating requirements of 610.42.
- (2) Overload relay elements in each ungrounded circuit conductor, with all relay elements protected from short circuit by the branch-circuit protection.
- (3) Thermal sensing devices, sensitive to motor temperature or to temperature and current, that are thermally in contact with the motor winding(s). A hoist or trolley shall be considered to be protected if the sensing device is connected in the hoist's upper limit switch circuit so as to prevent further hoisting during an overload condition of either motor.

(B) **Manually Controlled Motor.** If the motor is manually controlled, with spring return controls, the overload protective device shall not be required to protect the motor against stalled rotor conditions.

(C) **Multimotor.** Where two or more motors drive a single trolley, truck, or bridge and are controlled as a unit and protected by a single set of overload devices with a rating equal to the sum of their rated full-load currents, a hoist or trolley shall be considered to be protected if the sensing device is connected in the hoist's upper limit switch circuit so as to prevent further hoisting during an overtemperature condition of either motor.

(D) **Hoists and Monorail Hoists.** Hoists and monorail hoists and their trolleys that are not used as part of an overhead traveling crane shall not require individual motor overload protection, provided the largest motor does not exceed 7½ hp and all motors are under manual control of the operator.

## VI. Control

### 610.51 Separate Controllers

Each motor shall be provided with an individual controller unless otherwise permitted in 610.51(A) or (B).

(A) **Motions with More Than One Motor.** Where two or more motors drive a single hoist, carriage, truck, or bridge, they shall be permitted to be controlled by a single controller.

(B) **Multiple Motion Controller.** One controller shall be permitted to be switched between motors, under the following conditions:

- (1) The controller has a horsepower rating that is not lower than the horsepower rating of the largest motor.
- (2) Only one motor is operated at one time.

### 610.53 Overcurrent Protection

Conductors of control circuits shall be protected against overcurrent. Control circuits shall be considered as protected by overcurrent devices that are rated or set at not more than 300 percent of the ampacity of the control conductors, unless otherwise permitted in 610.53(A) or (B).

(A) **Taps to Control Transformers.** Taps to control transformers shall be considered as protected where the secondary circuit is protected by a device rated or set at not more than 200 percent of the rated secondary current of the transformer and not more than 200 percent of the ampacity of the control circuit conductors.

(B) **Continuity of Power.** Where the opening of the control circuit would create a hazard, as for example, the control circuit of a hot metal crane, the control circuit conductors shall be considered as being properly protected by the branch-circuit overcurrent devices.

### 610.55 Limit Switch

A limit switch or other device shall be provided to prevent the load block from passing the safe upper limit of travel of all hoisting mechanisms.

### 610.57 Clearance

The dimension of the working space in the direction of access to live parts that are likely to require examination, adjustment, servicing, or maintenance while energized shall be a minimum of 750 mm (2½ ft). Where controls are enclosed in cabinets, the door(s) shall either open at least 90 degrees or be removable.

## VII. Grounding

### 610.61 Grounding

All exposed non-current-carrying metal parts of cranes, monorail hoists, hoists, and accessories, including pendant controls, shall be bonded either by mechanical connections or bonding jumpers, where applicable, so that the entire crane or hoist is a ground-fault current path as required or permitted by Article 250, Parts V and VII.

Moving parts, other than removable accessories, or attachments that have metal-to-metal bearing surfaces, shall be considered to be electrically bonded to each other through bearing surfaces for grounding purposes. The trolley frame and bridge frame shall not be considered as electrically grounded through the bridge and trolley wheels and its respective tracks. A separate bonding conductor shall be provided.

The requirements of 610.61 are not intended to allow the trolley frame or bridge frame to serve as the equipment grounding conductor for electrical equipment (such as motors, motor controllers, luminaires, and transformers) on a crane. The equipment grounding conductors that are run with the circuit conductors are required to be one of the types described in 250.118. Metal-to-metal bearing surfaces of moving parts are considered to be a suitable grounding and bonding connection. However, the bridge and trolley wheel contact with their tracks is not permitted to be used as a reliable grounding and bonding connection. Due to dirt or other foreign surfaces impeding the effectiveness of the wheel-to-track contact as a reliable grounding and bonding connection, the bridge and trolley frames of an electric crane are now required to be bonded through the use of a separate conductor.

## I. General

### 620.1 Scope

This article covers the installation of electrical equipment and wiring used in connection with elevators, dumbwaiters, escalators, moving walks, platform lifts, and stairway chairlifts.

Beginning with the 1996 edition of the *Code*, there has been a continuing effort to revise Article 620 to harmonize elevator requirements throughout North America and to keep pace with modern advances in elevator technology. These changes continue to reflect time-honored safety concerns and more accurately address the use of modern equipment.

Informational Note No. 1: For further information, see ASME A17.1-2007/CSA B44-07, *Safety Code for Elevators and Escalators*.

Informational Note No. 2: For further information, see CSA B44.1-04/ASME-A17.5-2004, *Elevator and Escalator Electrical Equipment Certification Standard*.

Informational Note No. 3: The term *wheelchair lift* has been changed to *platform lift*. For further information, see ASME A18.1-2008, *Safety Standard for Platform Lifts and Stairway Lifts*.

Informational Note No. 1 to 620.1 points out the existence of the widely recognized elevator code, ASME A17.1-2007/CSA B44-07, *Safety Code for Elevators and Escalators*. ASME A17.1 contains many construction and maintenance requirements, from required machine room lighting to seismic considerations.
